Transcendentalised (the future age was more and more contrasted with the present, and the transition from the one to the other was not expected as the result of historical movements, but of miraculous divine acts), and dogmatized (the attempt was made to systematize in some measure the vague and varied prophetic anticipations). Only a very brief summary of the conceptions current in these writings can be given. The coming of the Messiah will be preceded by the Last Woes. The Messiah is very variously conceived: (1) "a passive, though supreme member of the Messianic Kingdom"; (2) "an active warrior who slays his enemies with his own hand"; (3) "one who slays his enemies by the word of his mouth, and rules by virtue of his justice, faith and holiness"; (4) a supernatural person, "eternal Ruler and Judge of Mankind" (R. H. Charles in Hastings's Bible Dictionary, i. p. 748).

In some of the writings no Messianic kingdom is looked for; in others only a temporal duration on earth is assigned to it; in others still it abides for ever either on earth as it is, or on earth transformed. The dispersion among the nations is to return home. Sometimes the Resurrection is narrowed down to the resurrection of the righteous, as indicated by the resurrection of all mankind after the last judgment. A blessed immortality after the judgment, or even after death itself, is sometimes taught without reference to any resurrection. Retribution in human history is recognized, but attention is specially concentrated on the final judgment, which is usually conceived as taking place in two stages. (1) The Messianic is executed by the Messiah or the saints by victory in war, or by judicial sentence. (2) The final remains in God's hands; but in one writing (the Ethiopic Enoch) is represented as Messiah's function. This judgment either closes the Messianic age, if thought of as temporal, or ushers it in, if conceived as eternal, or closes the world's history, if no Messianic age is expected. The place of torment for the wicked was called Gehenna (the valley of Hinnom or the Sons of Hinnom, where the bodies of criminals were cast out, is described in Is. lxxvi. 24). Here corporal as well as spiritual punishment was endured; it was inflicted on apostate Jews or the wicked generally; the righteous witnessed its initial stages but not its final form. In later Judaism it was the purgatory of faithless Jews, who at last reached Paradise, but it remained the place of eternal torment for the Gentiles. Paradise was sometimes regarded as the division of Sheol to which the righteous passed after death, but at others it was conceived as the heavenly abode of Moses, Enoch and Elijah, to which other saints would pass after the last judgment.

The eschatology of the New Testament attaches itself not only to that of the Old Testament but also to that of contemporary Judaism, but it avoids the extravagances of the latter. Not at all systematic, it is occasional, practical, poetical and dominantly evangelical, laying stress on the hope of the righteous rather than the doom of the wicked. The teaching of Jesus centres, according to the Synoptists, in the great idea of the "Kingdom of God," which is already present in the teacher Himself, but also future as regards its completion. In some parables a gradual realization of the kingdom is indicated (Matt. xviii.); in other utterances its consumption is connected with Christ's own return, His Parousia (Matt. xxiv. 3, 37, 38), the time of which, however, is unknown even to Himself (Mark xiii. 32). In this eschatological discourse (Matt. xxiv, xxv.) He speaks of the destruction of Jerusalem and of the end of the world as near, and seemingly as one. This is in accordance with the characteristic of prophecy, which sees in "timeless sequence" events which are historically separated from one another. While the Return is represented in the Synoptists as an external event, it is conceived in the fourth gospel as an internal experience in the operation of the Spirit on the believer (John xiv. 16-21); nevertheless here also the Parousia in the synoptic sense is looked for (John xxi. 22; cf. 1 John ii. 28). The object of the Second Coming is the execution of judgment by Christ (Matt. xxv. 31), both individual (xxii. 14) and universal (xiii. 36-42). The present subjective judgment, in which men determine their destiny by their attitude to Christ, on which the fourth gospel lays stress (John iii. 17-21, ix. 39), is not inconsistent with the anticipation of a final judgment (John xii. 48, v. 27). This judgment presupposes the resurrection, belief in which was rejected by the Sadducees, but accepted by the Pharisees and the majority of the Jewish people, and confirmed by Christ, not only as an individual spiritual renovation (John v. 25, 26), but as a universal physical resurrection (28 and 29; Matt. xxii. 39). This resurrection is of the unjust as well as the just (Matt. v. 29, 30, x. 28; Luke xiv. 14). On the Intermediate State Jesus does not speak clearly. He uses the term Hades twice metaphorically (Matt. xi. 23, xvi. 18), and once in a parable, the "Rich Man and Lazarus" (Luke xvi. 23), in which he employs the current phrases such as "Abraham's bosom," (verse 22), without any definite doctrinal intention, to unveil the secrets of the hereafter by confirming with His authority the common beliefs of His time. The term Paradise (Luke xxiii. 43) seems to be used in a large and general sense as a word of hope and comfort, and we need not attach to it any of the more definite associations which it had in Jewish eschatology. When he speaks of death as "sleep" (Luke viii. 52; John xi. 11) it is to give men to understand better thoughts of it, not to inculcate the doctrine of an intermediate state as an unconscious condition. There are words which suggest rather the hope of an immediate entrance of the just into the Father's house and glory (John xiv. 2, 3, xvii. 24). He spoke frequently and distinctly both of final reward for the righteous and final penalty for the wicked. "The recompense of the righteous is described as an inheritance, entrance into the kingdom, treasure in heaven, an existence like the angelic, a place prepared, the Father's house, the joy of the Lord, life, eternal life and the like; and there is no intimation that the reward is capable of change, that the condition is a terminable one. The retribution of the wicked is described as death, outer darkness, weeping and wailing and gnashing of teeth, the undying worm, the quenchless fire, exclusion from the kingdom, eternal punishment and the like." (S. D. J. Salmond in Hastings's Bible Dictionary, p. 752). Degrees of reward are recognized (Luke xii. 47, 48). Gehenna is applied to the condition of the lost (Matt. xviii. 8). Two sayings are held to point to a terminable penalty (Matt. v. 25, 26, xii. 31, 32), but the finality of a figurative description, that we are not warranted in drawing any such definite conclusion from either of them. The finality of destiny seems to be more plausibly expressed (Matt. vii. 23, x. 33, xiii. 30, xxv. 14, xxvi. 24, Mark ix. 43-48, viii. 36; Luke ix. 26; John iii. 16, viii. 21, 24). No second opportunity for deciding the issue of life or death is recognized by Jesus.

The apostolic eschatology presents resemblance amid difference. Jude (v. 6), as well as 2 Peter (ii. 4), refers to the judgment of the fallen angels. 2 Peter describes the place of their detention as Tartarus, and teaches that Christ's Parousia is to bring the whole present system of things to its conclusion, and the world itself to an end (iii. 10, 13). After the destruction of the existing order by fire, "a new heaven and a new earth" will appear as the abode of righteousness. The question of greatest interest in 1 Peter is the relation of two passages in it, the preaching to the spirits in prison (iii. 18-22) and the preaching of the Gospel to the dead (iv. 6) to the "larger hope." Peter's discourse also contains a phrase which suggests the belief of a descent of Christ into Hades in the interval between His death and His resurrection (Acts ii. 30). No certainty has been reached in the interpretation of these passages, but they may suggest to the Christian mind the expectation that the final destiny of the soul can be fixed until in some way or other, in this life or the next, the opportunity of decision for or against Christ has been given. The phrase "the times of restoration of all things" (iii. 21) is too vague in itself, and is too isolated in its context to warrant the dogmatic teaching of universalism, although there are other passages which seem to point towards the same goal. While John's Apocalypse is distinctly eschatological, the Epistles and the Gospels often give these conceptions an ethical and spiritual import, without, however, excluding the eschatological. Life is
present while eternal (1 John v. 12, 13), but it is also future (ii. 25). There is expected a future manifestation of Christ as He is, and what the believer himself will be does not yet appear (iii. 2). The writer speaks of the last hour (ii. 18), the Antichrist that comes (ii. 22, iv. 3), and the Christian's full reward (2 John v. 8) as well as the Parousia (1 John ii. 28). The Apocalypse reproduces much of the current Jewish eschatology. A millennial reign of Christ on earth is interposed between the first resurrection, confined to the saints and especially the martyrs, and the second resurrection for the rest of the dead. A final outburst of Satan's power is followed by his overthrow and the Last Judgment.

Although Paul sometimes describes the Kingdom of God as present (Rom. xiv. 17; 1 Cor. iv. 20; Col. i. 13), it is usually represented as future. The Parousia fills a large place in his thought, and, if more prominent in his earlier writings, is not altogether absent from his later, although the expectation of a parousial survival of the dead seems to diminish over time (cf. 1 Cor. xv. 21 and Phil. i. 20-24). The doctrines of the Resurrection, the Last Judgment, the Reward of the Righteous and the Punishment of the Wicked are not less distinctly expressed than in the other apostolic writings. Focal elements in Paul's eschatology are the doctrines of the Rapture of the Saints (1 Thess. iv. 17) and the Man of Sin (2 Thess. ii. 3-6), but these have affinities elsewhere. A reference to the millennial reign of Christ in the period between the two resurrections is sometimes sought in 1 Cor. xv. 22-24; but it is not a chronology of the last things Paul is here giving. So also a justification for the doctrine of purgatory is sought in iii. 12-15; but the day and the fire are of the last judgment. A descent of Christ into Hades, implying an extension of the opportunity of grace such as is supposed to be taught in 1 Peter, is also discovered in the obscure statements in Rom. x. 7 (where Paul is freely quoting Deut. xxx. 11-14), and Eph. i. 10 (where the reference is to Prov. xxvii. 26). In this model, universal restoration is inferred from 1 Cor. v. 28, “God all in all.” Phil. ii. 10-11, every knee bowing to, and every tongue confessing Jesus Christ, Eph. i. 6, 10, the summarizing up of all things in Christ, Col. i. 20, God reconciling all things unto Himself in Christ. These passages inspire a hope, but do not sustain a certainty. Paul’s shrinking from the disembodied state and longing to be clothed upon in death (2 Cor. v. 1-8) cannot be regarded as a proof of an interterm body prior to and preparatory for the resurrection body. Paul links the human resurrection with a universal renovation (Rom. viii. 19-23). Paul’s eschatology is not free of obscurities and ambiguities; and in the New Testament eschatology generally we are forced to recognize a mixture of inherited Jewish and original Christian elements (see Antichrist).

During the first century of the existence of the Gentile Christian Church, “the hope of the approaching end of the world and the glories of the Resurrection” (cf. iii. 22), although warnings had to be given against doubt and indifference. Redemption was thought of as still future, as the power of the devil had not been broken but rather increased by the First Advent, and the Second Advent was necessary to complete overthrow. The expectations were often grossly materialistic, as is evidenced by Papia’s quotation as the words of the Lord of a group of sayings from the Apocalypse of Baruch, setting forth the amazing fruitfulness of the earth in the Messianic time.

The Gnostics rejected this eschatology as in their view the enlightened spirit already possessed immortality. Marcion expected that the Church would be assailed by Antichrist; a visible return of Christ he did not teach, but he recognized that human history would issue in a separation of the good from the bad. Montanism sought to form a new Christian commonwealth which, separated from the world, should prepare itself for the descent of the Jerusalem from above, and its establishment in the spot which by the direction of the Spirit had been chosen in Phrygia. While Irenaeus held fast the traditional eschatological beliefs, yet his conception of the Christian salvation as a deification of man tended to weaken their hold on Christian thought. The Alogi in the second century rejected the Apocalypse on account of its chiliasm, its teaching of a visible reign of Christ on earth for a thousand years. Montanism also brought these apocalyptic expectations into discredit in orthodox ecclesiastical circles.

The Alexandrian theology strengthened this movement against chiliasm. Clement of Alexandria taught that justice is not merely retributive, that punishment is remedial, that probation continues after death till the final judgment, that Christ and the apostles preached the Gospel in Hades to those who lacked knowledge, but whose heart was right, that a spiritual body will be raised. Origen taught that a germ of the spiritual body is in the present body, and its development depends on the character, that perfect bliss is reached only by stages, that the evil are purified by pain, conscience being symbolized by fire, and that all, even the devil himself, will at last be saved. Both regarded chiliasm with aversion. But in the fifth century there were rejected as heretical (1) the doctrine of universalism, and the possibility of the redemption of the devil; (2) the doctrine of the complete annihilation of evil; (3) the conception of the penalties of hell as tortures of conscience; (4) the spiritualizing version of the resurrection of the body; (5) the idea of the continued creation of new worlds” (A. Harnack, History of Dogma, iii. p. 186).

Epiphanius, following Methodius, insisted on the most perfect identity between the resurrection body and the material body; and this belief, enforced in the West by Jerome, soon established itself as alone orthodox. Augustine made experiments on the flesh of a peacock in order to find physical evidence for the doctrine. He held fast to eternal punishment, but allowed the possibility of mitigations. Some believers, he taught, might pass through purgatorial fires; and this middle class may be helped by the sacraments and the alms of the living. “There are many souls not good enough to dispense with this provision, and not bad enough to be benefited by it” (Ep. cit. v. 233). This doctrine was sanctioned and developed by Gregory the Great. “After God has changed eternal punishment into temporary, the just must expiate these temporary penalties for sin in purgatory” (p. 268). This view was inferred indirectly from Matt. xii. 31, and directly from l Cor. iii. 14-15. Afterwards purgatory took more and more the place of hell, and was subject to the control of the church. As regards the saints, different degrees of blessedness were recognized; they were supposed to wait in Hades for the return of Christ, but gradually the belief gained ground, especially in regard to the martyrs, that their souls at once entered Paradise. The primitive Christian eschatology was preserved in the West as it was not in the East, and in times of exceptional distress the expectation of Antichrist emerged again and again. In the middle ages there was an extravagance of speculation on this subject, which may be seen in the last division of Aquinas’ Summa Theologiae. He proposes thirty questions on this matter, among which are the following: “whether souls are conducted to hell or heaven immediately after death?” “whether the limbus of hell is the same as Abraham’s bosom?” “whether the sun and moon will be really obscured at the day of judgment?” “whether all the members of the human body will rise with it?” “whether the hair and nails will reappear”; could thought become “more lawless and uncertain?”

While rejecting purgatory, Protestantism took over this eschatology. Souls passed at once to heaven or to hell; a doctrine even less adequate to the complex quality of human life. Luther himself looked for the passing away of the present evil world. Socinianism taught a new spiritual body, an intermediate state in which the soul is near non-existence, an annihilation of the wicked, as immortality is the gift of God. Swedenborg discards a physical resurrection, as at death the souls of men are opened to the spiritual world in which we exist now, and mankind to live essentially as they lived here, until by their affinities they are drawn to heaven or hell. The doctrine of eternal punishment has been opposed on many grounds, such as the disproportion between the offence and the penalty, the moral
and religious immaturity of the majority of men at death, the diminution of the happiness of heaven involved in the knowledge of the endless suffering of others (Schleiermacher), the defeat of the divine purpose of righteousness and grace that the continued antagonism of any of God’s creatures would imply, the dissatisfaction God as Father must feel until His whole family is restored. It has been argued that the term “eternal” has reference not to duration of time but quality of being (Maurice); but it does seem certain that the writers in the Holy Scriptures who used it did not foresee an end either to the life or to the death to which they applied the term. The contention should not be based on the meaning of a single word, but on such broader considerations as have been indicated above. The doctrine of conditional immortality taught by Socinianism was accepted by Archibishop Whately, and has been most persistently advocated by Edward White, who “maintains that immortality is a truth, not of reason, but of revelation, a gift of God” bestowed only on believers in Christ; but he admits a continued probation after death for such as have not hardened their hearts by a rejection of Christ. According to Albrecht Ritschl “the work of God means the resolve of God to annihilate those men who finally oppose themselves to redemption, and the final purpose of the kingdom of God.” He thus makes immortality conditional on inclusion in the kingdom of God. The doctrine of universal immortality was maintained by Melancthon in Linzaeth, and on the ground of the Fatherhood of God, and Archdeacon Wilson anticipates such discipline after death as will restore all souls to God. C. L. Nitzsch argues against the doctrine of the annihilation of the wicked, regards the teaching of Scripture about eternal damnation as hypothetical, and thinks it possible that Paul reached the hope of universal restoration. I. A. Dörner maintains that hopeless perdition can be the penalty only of the deliberate rejection of the Gospel, that those who have not had the opportunity of choice fairly and fully in this life will get it hereafter, but that the right choice will in all cases be made we cannot be confident. The attitude of theologians generally regarding individual destiny is well expressed by Dr James Orr. “The conclusion I arrive at is that we have not the elements of a complete solution, and we ought not to attempt it. Whatever visions beyond there may be, what larger hopes, what ultimate harmonies, if such there are in store, will come in God’s good time; it is not for us to anticipate that, or lift the veil where God has left it down” (The Christian View of God and the World, 1893, p. 397).

Although in recent theological thought attention has been mainly directed to the meaning of immortality in the light of the eschatology of history, the doctrine of God’s eschatology must not be altogether passed over. History has offered the authoritative commentary on the prophecy of the Parousia of Christ. The presence and power of His Spirit, the spread of His Gospel, the progress of His kingdom have been as much a fulfilment of the eschatological teaching of the New Testament as His life and work on earth were a fulfilment of Messianic prophecy, for fulfilment always transcends prophecy. Even if the common beliefs of the apostolic age have not modified the evangelist’s reports of Jesus’ teaching, it must be remembered that He used the common prophetic phraseology, the literal fulfilment of which is not to be looked for. Some parables (the leaven, the mustard seed) suggest a gradual progressive realization of His kingdom. The Fourth Gospel interprets both judgment and resurrection spiritually. Accordingly the general resurrection and the last judgment may be regarded as the temporal and local forms of thought to express the universal permanent truths that life survives death in the completeness of its necessary organs and essential functions, and that the character of that continued life is determined by personal choice of submission to the teaching of God’s purpose and grace. In the preceding realization of which is the Christian’s hope for himself, mankind, and the world.

BIBLIOGRAPHY.—In addition to the works referred to above the following will be found useful: S. D. F. Salmond, The Christian Doctrine of Immortality (4th ed., 1901); R. H. Charles, A Critical History of the Doctrine of a Future Life in Israel, in Judaism, and in Christianity (1909); L. N. Dahl, Life after Death and the Future of the Kingdom of God (Eng. tr. by J. Beveridge, 1865); J. A. Beet, The Last Things (new ed., 1905); W. G. T. Shed, Doctrine of Endless Punishment (New York, 1886); F. W. Farrar, The Eternal Hope (1892); E. Pellet, The Problem of Immortality (Eng. tr. by F. A. Freer, 1892); E. White, Life in Christ (3rd ed., 1878); also the relevant sections in books on biblical and systematic theology (Eng. tr. by A. E. G.)

ESCHEAT (O. Fr. escheete, from escheoir, to fall to one’s share; Lat. excidere, to fall out), in English law, the reversion of lands to the next lord on the failure of heirs of the tenant. “When the tenant of an estate in fee simple dies without having alienated his estate in his lifetime or by his will, and without leaving any heirs either lineal or collateral, the lands in which he held his estate escheat, as it is called, to the lord of whom he held them” (Williams on the Law of Real Property). This rule is explained by the combination of a freehold estate as an interest in lands held by the freeholder from some lord, the king being lord paramount. (See Estate.) The grantee retains an interest in the land similar to that of the donor of an estate for life, to whom the land reverts after the life estate is ended. As there are now few freehold estates traceable to any mesne or intermediate lord, escheats, when they do occur, fall to the king as lord paramount. Besides escheat for defect of heirs, there was formerly also escheat

ESCHENBACH, JOHANN (1474-1820), German critic and literary historian, was born at Hamburg on the 7th of December 1743. After receiving his early education in his native town, he studied at Leipzig and Göttingen. In 1767 he was appointed tutor, and subsequently professor, at the Collegium Carolinum in Brunswick. The title of “His Holiness” was conferred on him in 1786, and in 1814 he was made one of the directors of the Carolinum. He is best known by his efforts to familiarize his countrymen with English literature. He published a series of German translations of the works of the principal English writers on aesthetics, such as J. Brown, D. Webb, Charles Burney, Joseph Priestley and R. Hurd; and Germany owes also to him a German translation (in prose) of Shakespeare’s plays (William Shakespeare’s Schauspiele, 13 vols., Zürich, 1775-1782). This is virtually a revised edition of the incomplete translation published by Wieland between 1762 and 1766. Eschenbach died at Brunswick on the 29th of February 1820.

Besides editing, with memoirs, the works of Hagedorn, Zacharia and other German poets, he was the author of a Handbuch der klassischen Literatur (1783); Entwurf einer Theorie und Literatur der schönen Wissenschaften (1783); Beispielsammlung zur Theorie und Literatur der schönen Wissenschaften (8 vols., 1788-1795); Lehrbuch der Wissenskunde (1792); and Denkmäler altdutschecker Dichtkunst (1799). Most of these works have passed through several editions. Eschenbach was also a poet of some pretensions, and some of his religious hymns, e.g. Ich will dich noch im Tod erheben und Dir trau ich, Gott, und wanne nicht, are contained in many hymnals to this day.

ESCHENMAYER, ADAM AUGUST VON (1688-1852), German philosopher and physicist, was born at Neuenburg in Württemberg in July 1768. After receiving his early education at the Caroline academy of Stuttgart, he entered the university of Tübingen, where he received the degree of doctor of medicine. He practised for some time as a physician at Sulz, and then at Kirchheim, and in 1811 he was chosen extraordinary professor of medicine and philosophy at Tübingen. In 1818 he became
ordinary professor of practical philosophy, but in 1836 he resigned and took up his residence at Kirchheim, where he devoted his whole attention to philosophical studies. Eschenmayer's views are largely identical with those of Schelling, but he differed from him in regard to the knowledge of the absolute. He believed that in order to complete the arc of truth philosophy must be supplemented by what he called "non-philosophy," a kind of mystical illumination by which was obtained a belief in God that could not be reached by mere intellectual effort (see Hoffding, Hist. of Mod. Phil., Eng. trans. vol. 2, p. 170). He carried this tendency to mysticism into his physical researches, and was led by it to take a deep interest in the phenomena of animal magnetism. He ultimately became a devout believer in demoniacal and spiritual possession; and his later writings are all strongly impregnated with the lower supernaturalism.

His principal works are—Die Philosophie in ihrem Uebergange zur Nichtphilosophie (1803); Versuch die scheinbare Moglich, den histor. Magnetismus aus philosoph. und psychischen Gesetzen zu erklären (1816); System der Moralphilosophie (1818); Physiologie in drei Theilen, als empirische, reine, angewandte (1817, 2nd ed. 1822); Religiöse Philosophie (3 vols., 1818-1824); Die Hegel'sche Religiöse Philosophie verglichen mit dem christl. Princip (1834); Der Iscartio-Himmel (1835); Forscher Tage (1835); Konflikt zwischen Himmel und Hölle, an dem Dämon eines besessenen Mädchens beobachtet (1837); Grundriss der Naturphilosophie (1832); Grundzüge der christl. Philosophie (1840); and Betrachtungen über den bürgerlichen Konflikt (1834).

ESCHER VON DER LINTH, ARNOLD (1807-1872), Swiss geologist, the son of Hans Conrad Escher (1767-1823), was born at Zürich on the 8th of June 1807. In 1836 he became professor of geology at the École Polytechnique at Zürich. His researches led him to be regarded as one of the founders of Swiss geology. With B. Studer he produced (1852-1853) the first elaborate geological map of Switzerland. He was the author also of Geologische Bemerkungen über das nördliche Vorarlberg and einige angrenzende Gegenden, published at Zürich in 1853. He died on the 12th of July 1872.

ESCHSCHOLTZ, JOHANN FRIEDRICH (1793-1831), Russian traveller and naturalist, was born in November 1793, at Dorpat, where he died in May 1831. He was naturalist and physician to Otto von Kotzebue's exploring expedition during 1815-1818. On his return he was appointed extraordinary professor of anatomy (1819) and director of the zoological museum of the university at Dorpat (1821), and in 1825-1826 he accompanied Kotzebue on his second voyage of discovery. He became ordinary professor of anatomy in Dorpat in 1828. Among his publications were the System der Aalen (1820), and the Zoologischer Atlas (1829-1833). The botanical genus Eschscholtzia was named by Adelbert von Chamisso in his honour.

ESCHWEGE, a town of Germany, in the Prussian province of Hesse-Nassau, on the Werra, and the railway Tresya-Leinefelde, 28 m. S.E. of Cassel. Pop. (1905) 11,113. It consists of the old town on the left, the new town on the right, bank of the Werra, and Brückenhausen on a small island connected with the old and new town by bridges. It is a thriving manufacturing town, its chief industries being leather-making, yarn-spinning, cotton- and linen-weaving, the manufactures of cigars, brushes, liquors and oil, and glue- and soap-boiling. It has two ancient buildings, the Nikolai-turm, built in 1455, and the old castle. After being part of Thuringia, Eschwege passed to Hesse in 1623. It was recovered by the landgrave of Thuringia in 1388, but soon reverted to Hesse, and it became the residence of one of the branches of the Hessian royal house, a branch which died out in 1635.

ESCHEWAL, a town of Germany, in the Prussian Rhine province, on the Inde, and the railways Cologne-Herbesthal and Munich-Glauchau-Solberg, about 5 m. N.W. E.N.E. from Alzey-Chapelle. Pop. (1905) 20,613. The town has an Evangelical and four Roman Catholic churches, a gymnasium and an orphanage. The manufacture of iron and steel goods is carried on; other industries include the manufacture of zinc wares, tanning, distilling and brewing. In the neighbourhood there are valuable coal mines.

See Koch. Geschichte der Stadt Escheweiler (Frankfort, 1890).

ESCOBAR Y MENDOZA, ANTONIO (1589-1666). Spanish churchman of illustrious descent, was born at Valladolid in 1589. He was educated by the Jesuits, and at the age of fifteen took the habit of that order. He soon became a famous preacher, and his facility was so great that for fifty years he preached daily, and sometimes twice a day. In addition he was a voluminous writer, and his works fill eighty-three volumes. His first literary efforts were Latin verses in praise of Ignatius Loyola (1613) and the Virgin Mary (1618); but he is best known as a writer on casuistry. His principal works belong to the fields of exegesis and moral theology. Of the latter the best known are Summula casuum conscientiae (1627); Liber theologice moralis (1644), and Universae theologice moralis problemata (1652-1666). The first mentioned of these was severely criticised by Pascal in the fifth and sixth of his Provincial Letters, as tending to inculcate a loose system of morality. It contains the famous maxim that purity of intention may be a justification of actions which are contrary to the moral code and to human laws; and its general tendency is to find excuses for the majority of human frailties. His doctrines were disapproved of by many Catholics, and were mildly condemned by Rome. They were also ridiculed in witty verses by Molliere, Boileau and La Fontaine, and gradually the name Escobar came to be used in France as a synonym for a person who is adroit in making the rules of morality serve his purposes. His influence was said to have been simple in his habits, a strict observer of the rules of his order, and unrewarding zealous in his efforts to reform the lives of those with whom he had to deal. It has been said of him that “he purchased heaven dearly for himself, but gave it away cheap to others.” He died on the 4th of July 1660.

ESCOQUIZ, JUAN (1762-1820), Spanish ecclesiastical, politician and writer, was born in Navarre in 1762. His father was a general officer and he began life as a page in the court of King Charles III. He entered the church and was provided for by a prebend at Saragosse. Godoy in his memoirs asserts that Escoquiz sought to gain his favour by flattery. There is every reason to believe that this is an accurate statement of the case. The mere fact that he was selected to be the tutor of the heir-apparent, Ferdinand, afterwards King Ferdinand VII., is of itself a proof that he exerted himself to gain the goodwill of the reigning favourite. In 1797 he published a translation of Young's Night Thoughts, which does not of itself show that he was well acquainted with English, for the version may have been made with the help of the French. In 1798 he published a long and worthless history of theién, the first of his works. He was in fact a busy and pushing member of the literary clique which looked up to Godoy as its patron. But his position as tutor to the heir to the throne excited his ambition. He began to hope that he might play the part of those court ecclesiastics who had often had an active share in the government of Spain. As Ferdinand grew up, and after his marriage with a Neapolitan princess, he became the centre of a court opposition to Godoy and his policy of alliance with France. Escoquiz was the brains, as far as there were any brains, of the intrigue. His activity was so notorious that he was exiled from court, but was consolcd by a canonry at Toledo. This half measure was as ineffective as was to have been expected. Escoquiz continued to be in constant communication with the prince. Toledo is close to Madrid, and the correspondence was easily maintained. He had a large share in the conspiracy of the Escorial which was detected on the 28th of October 1807. He was imprisoned and sent for trial with other conspirators. But as they had appealed to Napoleon, who would not suffer his name to be mentioned, the government had to allow the matter to be hushed up, and he was pronounced acquitl. After the outbreak at Aranjuez on the 17th of March 1808, in which he had a share, he became one of the most trusted advisers of Ferdinand. The new king's decision to go to meet Napoleon at Bayonne was largely inspired by him. In 1814 Escoquiz published at Madrid his Idea Sencilla de las razones que motivaron el viaje del Rey Fernando VII. a Bayona (Honest representation of the causes which inspired the journey of King Ferdinand VII. to Bayonne).
ESCOMBE, HARRY (1838-1890), South African statesman, a member of a Somersetshire family, was born at Notting Hill, London, on the 27th of July 1838, and was educated at St Paul's School. After four years in a stockbroker's office, he emigrated, in 1859, to the Cape. The following year he moved to Natal, and, after trying other occupations, qualified as an attorney. He was elected to the Legislative Council of Natal in 1872, was elected for Durban as a member of the legislative council, and subsequently was also placed on the executive council. In 1880 he secured the appointment of a harbour board for Natal, and was himself made chairman. The transformation of the port of Durban into a harbour available for ocean liners was due entirely to his energy. In 1888-1889 he defended Dinizulu and other Zulu chiefs against a charge of high treason. For several years he opposed the grant of responsible government to Natal, but by 1890 had become convinced of its desirability, and on its conferment in 1893 he joined the first ministry formed, serving under Sir John Robinson as attorney-general. In February 1897, on Sir John's retirement, Escombe became premier, remaining attorney-general and also holding the office of minister of education and minister of defence. In the summer of that year he was in London with the other colonial premiers at the celebration of the Diamond Jubilee of Queen Victoria, and was made a member of the privy council. Cambridge University conferred upon him the honorary degree of LL.D. In February 1899 the members of his cabinet resigned, and the premier was unable to continue his policy, and he resigned office (October 1897). Throughout his life he took an active interest in national defence. He had served in the Zulu War of 1879, was commander of the Natal Naval Volunteers and received the volunteer long service decoration. In October 1899 he went to the northern confines of the colony to take part in preparing measures of defence against the invasion by the Boers. He died on the 27th of December 1899.

The Speeches of the late Right Hon. Harry Escombe (Maritzburg, 1903), edited by J. T. Henderson, contains brief biographical notes by Sir John Robinson and the editor.

ESCORIAL, or ESCORIAL, in Spain, one of the most remarkable buildings in Europe, comprising at once a convent, a church, a palace and a mausoleum. The Escorial is situated 3432 ft. above the sea, on the south-western slopes of the Sierra de Guadarrama, and thus within the borders of the province of Madrid and the kingdom of New Castile. By the Madrid-Avila railway it is 31 m. N.W. of Madrid. The surrounding country is a sterile and gloomy wilderness exposed to the cold and blighting winds of the Sierra de Guadarrama.

According to the usual tradition, which there seems no sufficient reason to reject, the Escorial owes its existence to a vow made by Philip II. of Spain (1556-1598), shortly after the battle of St Quentin, in which his forces succeeded in routing the army of France. The day of the victory, the 10th of August 1557, was sacred to St Laurence; and accordingly the building was dedicated to that saint, and received the title of El real monasterio de San Lorenzo del Escorial. The last distinctive epithet was derived from the little hamlet in the vicinity which furnished shelter, not only to the workmen, but to the monks of St Jerome who were afterwards to be in possession of the monastery; and the hamlet itself is generally but perhaps erroneously supposed to be indebted for its name to the scorbutic or disease of certain old iron mines. The preparation of the plans and the superintendence of the work were entrusted by the king to Juan Bautista de Toledo, a Spanish architect who had received most of his professional education in Italy. The first stone was laid in April 1563; and under the king's personal inspection the work rapidly advanced. Abundant supplies of barroqueña, a granite-like stone, were obtained in the neighbourhood, and for rarer materials the resources of both the Old and the New World were put under contribution. The death of Toledo in 1569 threatened a fatal blow at the satisfactory completion of the enterprise, but a worthy successor was found in Juan Herrera, Toledo's favourite pupil, who adhered in the main to his master's designs. On the 13th of September 1584 the last stone of the mausoleum was laid, and the works were brought to a termination in 1593. Each successive occupant of the Spanish throne has done something, however slight, to the restoration or adornment of Philip's convent-palace, and Ferdinand VII. (1808-1833) did so much in this way that he has been called a second founder. In all its principal features, however, the Escorial remains what it was made by the last in Escorial, complete. Herrera working out the design, if no longer, of desires of their master.

The ground plan of the building is estimated to occupy an area of 306,782 sq. ft., and the total area of all the storeys would form a causeway 1 metre in breadth and 95 m. in length. There are seven towers, fifteen gateways and, according to Los Santos, no fewer than 12,000 windows and doors. The general arrangement is shown by the accompanying plan. Entering by the main entrance the visitor finds himself in an atrium, called the Court of the Kings (Patio de los reyes), from the 17th-century statues of the kings of Judah, by Juan Bautista Moncoro, which adorn the façade of the church. The sides of the atrium are unfortunately occupied by plain ungracefully buildings five storeys in height, awkwardly accommodating themselves to the upward slope of the ground. Of the grandeur of the church itself, however, there can be no question: it is the finest portion of the whole Escorial, and, according to Fergusson, deserves to rank as one of the great Renaissance churches of Europe. It is about 340 ft. from east to west by 200 from north to south, and thus occupies an area of about 70,000 sq. ft. The dome is 142 ft. in diameter, and its height at the centre is 635 ft. In the interior one is struck by the coolness and the breadth of its rooms, by the simplicity of the details and by the grandeur of its proportions. It can be called the most perfect example of the Renaissance style in Spain. The design is in accordance with the Italian models, the domes being octagonal and the ceilings consisting of coffered ribbed vaults. The simplicity of the form is contrasted with the bold and simple forms of the church, which belongs to the Doric style, were the bronze and marbles and pictures of the high altar, the masterpiece of the Milanesi Giacomo Trezzo, almost ruined by the French in 1808. Directly under the altar is situated the pantheon or royal mausoleum, a richly decorated octagonal chamber with upwards of twenty niches, occupied by black marble urnas or sarcophagi, kept sacred for the dust of kings or mothers of kings. There are the remains of Charles V. (1516-1556), of Philip II., and of all their successors on the Spanish throne down to Ferdinand VII., with the exception of Philip V. (1700-1746) and Ferdinand VI. (1746-1759). Several of the sarcophagi are still empty. For the other members of the royal family there is a separate vault, known as the Panteon de los Infantes, or more familiarly by the dreadfully suggestive name of El Pudriadero. The most interesting room in the palace is Philip II.'s cell, from which through an opening in the wall he could see the celebration of mass while too ill to leave his bed.

The library, situated above the principal portico, was at one time remarkable for the number of books it contained in the king's own collection, the extensive bequest of Diego de Mendoza, Philip's ambassador to Rome, the spoils of the emperor of Morocco, Muley Zidan (1603-1628) and various contributions from convents, churches and cities. It suffered greatly in the fire of 1671, and has since been impoverished by plunder and neglect. Among its curiosities still extant are two New Testament Codices of the 10th century and two of the 11th; various works by Alphonso the Wise (1252-1284), a Virgil of the 14th century, a Koran of the 15th, &c. Of the Arabic manuscripts which it contained in the 17th century a catalogue was given in J. H. Hottinger's...
Promptuarium sine bibliotheca orientalis, published at Heidelberg in 1598, and another in the 18th, in M. Casiri's Bibliotheca Arabico-Hispanica (2 vols., Madrid, 1760-1770). Of the artistic treasures with which the Escorial was gradually enriched, it is sufficient to mention the frescoes of Peregrin or Pellagrin Tibaldi, Luis de Carbajal, Bartolommeo Carducci or Carducho, and Luca Giordano, and the pictures of Titian, Tintoretto and Velasquez. These paintings all date from the 15th or the 17th century. Many of those that are movable have been transferred to Madrid, and many others have perished by fire or sack. The conflagration of 1671, already mentioned, raged for fifteen days, and only the church, a part of the palace, and two towers escaped uninjured. In 1808 the whole building was exposed to the ravages of the French soldiers under General La Houssaye. On the night of the 1st of October 1872, the college and seminary, a part of the palace and the upper library were devastated by fire; but the damage was subsequently repaired. In 1885 the conventual buildings were occupied by Augustinian monks.

The reader will find a remarkable description of the emotional influence of the Escorial in E. Quinet's Vacances en Espagne (Paris, 1846), and for historical and architectural details he may consult the following works:—Fray Juan de San Gerónimo, Memorias sobre la fundacion del Escorial y su fabrica, in the Coleccion de documentos inéditos para la historia de España, vol. vii.; Y. de Herrera, Sumario y breve declaracion de los diseños y estampas de la fab. de S. Lorenzo el Real del Escorial (Madrid, 1586); José de Siguenza, Historia de la orden de San Gerónimo, &c. (Madrid, 1590).

\[1\] Reduced from a large plan of the Escorial in the British Museum, Monasterio del Escorial, published at Madrid in 1876.

ESCOVEDO, JUAN DE (d. 1578), Spanish politician, secretary of Don John of Austria, and chiefly notable as having been the victim of one of the mysteries of the 16th century, began life in the household of Ruy Gomez de Silva, prince of Eboli, the most trusted minister of the early years of the reign of Philip II. By the will of the prince he was endowed for life with the post of Regidor, or legal representative of the king in the municipality of Madrid. He was also associated with Antonio Perez as one of the secretaries who acted as the agents of the king in all dealings with the various governing boards which formed the Spanish administration. When Don John of Austria, after the battle of Lepanto in 1571, began to launch on a policy of self-seeking adventure, acting as his secretary with the intention that he should act as a check on these follies. Unhappily for himself and for Don John he went heart and soul into all the prince's schemes. He began to disobey orders from Madrid and became entangled in intrigues to manage or even to coerce the king. In July 1577, and contrary to the king's orders, he came to Spain from Flanders, where Don John was then governor. It is said that he discovered the love intrigue between Antonio Perez and the widowed princess of Eboli, Ana Mendoza de la Cerda. This is, however, mere gossip and supposition. There can be no doubt that he was a busy intriguer, or that the king, acting on the then very generally accepted doctrine that the sovereign has a right to act for the public interest without regard to forms of law, gave orders to Antonio Perez that he was to be put out of the way. After two clumsy attempts had been made to poison him at Perez's table, he was killed by bravos on the night of Easter Monday, the 31st of March 1578. According to an old tradition the murder took place outside the church of St Maria in Madrid, which was pulled down in 1868.

ESCUINTLA, the capital of the department of Escuintla, Guatemala; on the southern slope of the Sierra Madre, 45 m. S.W. of Guatemala city. Pop. (1905) about 12,000. Escuintla is locally celebrated for its hot mineral springs. It is the commercial centre of a fertile district, which produces coffee, cane-sugar and cocoa; it has also a brisk transit trade in most of the products of Guatemala, owing to its position on the interoceanic railway between Puerto Barrios on the Atlantic and San Josè (30 m. S.) on the Pacific. A branch railway which goes westward to San Augustín meets this line at Escuintla.

ESCUTCHEON (O. Fr. escucheon, escusson, modern écusson, through a Late Lat. form from Lat. scutum, shield), an heraldic term for a shield with armorial bearings displayed (see HERALDRY). The word is also applied to the shields used on tombs, in the spandrels of doors or in string-courses, and to the ornamented plates from the ceiling of which the ring-knockers, &c., are suspended, or which protect the wood of the key-hole from the wear of the key. In medieval times these were often worked in a very beautiful manner.

ESHER, WILLIAM BALIOL BRETl, 1ST VISCOUNT (1817-1890), English lawyer and master of the rolls, was a son of the Rev. Joseph G. Brett, of Chelsea, and was born on the 13th of August 1817. He was educated at Westminster and at Caius College, Cambridge. Called to the bar in 1839, he went the northern circuit, and became a Q.C. in 1861. On the death of Richard Cobden he unsuccessfully contested Rochdale as a Conservative, but in 1866 was returned for Helston in unique circumstances. He and his opponent polled exactly the same number of votes, whereupon the mayor, as returning officer, gave his casting vote for the Liberal candidate. As this vote was given after four o'clock, however, an appeal was lodged, and the House of Commons allowed both members to take their seats. Brett rapidly made his mark in the House, and in 1858 he was appointed solicitor-general. On behalf of the crown he prosecuted the Fenians charged with having caused the Clerkenwell explosion. In parliament he took a leading part in the promotion of bills connected with the administration of law and justice. He was (August 1868) appointed a justice in the court of common pleas. Some of his sentences in this capacity excited much criticism, notably some of the cases of the gas stokers' strike, when he sentenced the defendants to imprisonment for twelve months, with hard labour, which was afterwards reduced by the home secretary to four months. On the reconstitution of the court of appeal in 1876, Brett was elevated to the rank of a lord justice. After holding this position for seven years, he succeeded Sir George Jessel as master of the rolls in 1883. In 1885 he was raised to the House of Lords as Baron Esher. He opposed the bill proposing that an accused person or his wife might give evidence in their own case, and supported the bill which empowered lords of appeal to sit and vote after their election to the peerage. The bill, which increased the powers of the Incorporated Law Society, owed much of its influence. In 1886 he delivered a remarkable speech in the House of Lords, deprecating the delay and expense of trials, which he regarded as having been increased by the Judicature Acts. Lord Esher suffered, perhaps, as master of the rolls from su-cceeding a lawyer of such eminence as Jessel. He had a caustic tongue, but also a fund of shrewd common sense, and one of his favourite considerations was whether a certain course was "business" or not. He retired from the bench at the close of 1897, and a viscountcy was conferred upon him on his retirement, a dignity never given to any judge, lord chancellors excepted, "for more legal conduct since the time of Lord Coke." He died in London on the 24th of May 1899.

Lord Esher was succeeded in the title by his only surviving son, Reginald Baliol Brett (b. 1852), who was secretary to the office of works from 1855 to 1902, but subsequently came to far greater public prominence in 1904 as chairman of the war office reconstitution committee after the South African War.

ESHER, a township in the Epsom parliamentary division of Surrey, England, 14 m. S.W. of London by the London & South Wcta. 7d railway (Esher and Claremont station). It is pleasantly situated on rising ground above the river Mole, 3 m. from its junction with the Thames. To the north-west lie the grounds of Esher Place. Of the mansion-house founded by William of Waynflete, bishop of Winchester (c. 1450), in which Cardinal Wolsey resided for three or four weeks after his sudden fall from power in 1529, only the gatehouse remains. It is known as Wolsey's Tower, but is apparently part of Waynflete's foundation. A new mansion was erected in 1803. To the south is Claremont Palace, built by the great Lord Clive (1769) on the site of a mansion of Sir John Vanbrugh. In 1816 it was the residence of Princess Charlotte, wife of Prince (afterwards King) Leopold. She died here in 1817, and on the death of her husband in 1865 the property passed to the crown. Louis Philippe, ex-kling of the French, resided here from 1848 until his death in 1850. In 1882 Claremont became the private property of Queen Victoria, and the Church, Esher, contains fine memorials of King Leopold and others, and one of its three bells is said to have been brought from San Domingo by Sir Francis Drake. To the north near the railway station is Sandown Park, where important race meetings are held. Esher is included in the urban district of Esher and The Dittons, of which Thames Ditton is a favourite riverside resort. The whole district is largely residential. Pop. (1901) 9489.

ESKER (O. Irish eiscir), a local name for long mounds of glacial gravel frequently met with in Ireland. Eskers (the Swedish åsar) are among the occasionally puzzling relics of the British glacial period. They wind from side to side across glaciated country and have evidently been formed by channels upon or under the ice. "Where streams of considerable size form tunnels under or in the ice these may become more or less filled
with wash, and when the ice melts the aggraded channels appear as long ridges of gravel and sand known as eskers. It has been thought that similar ridges are sometimes formed in valleys cut in the ice from top to bottom, and even that they rise from gravel and sand lodged in super-glacial channels. The latter at least is probably rare, as the surface streams have usually high gradients, swift currents and smooth bottoms, and hence give little opportunity for lodgment. In the case of ice-sheets, too, in which eskers are chiefly developed, there is usually no surface material except at the immediate edge, where the ice is thin and its layers upturned" (T. C. Chamberlin and R. D. Salisbury, Geology, Processes and their Results). Eskers are to be distinguished from kames (q.v.).

ESKLSTUNA—ESKIMO

769

ESKLSTUNA, a town in Sweden in the district (län) of Södermanland, on the Hjelm river, which unites lakes Hjelm and Mälar, 65 m. W. of Stockholm by rail. Pop. (1900) 13,663. The place is mentioned in the 13th century, and is said to derive its name from Eskil, an English missionary who suffered martyrdom on the spot. Its rise to importance in the reign of Charles X., who bestowed on it considerable privileges, and gave the first impulse to its manufacturing industry. It is the chief seat in Sweden of the weaving industry, its cottage weaving being especially noted, while damascened work is a specialty. There is a technical school for the metal industries. There are, in the town or its neighbourhood, great engineering, gun-making, and rolling and polishing works and breweries. The largest mechanical works are those of Munkell and Tunaflors. The Carl Gustaf Stads rifle factory was established in 1814.

ESKIMO, ESKIMOS or ESQUIMAUX (a corruption of the Abnaki Indian Eskimantisc or the Ojibway Ashkimeq, both terms meaning "those who eat raw flesh": they call themselves "Inuit," "the people"), a North American Indian people, inhabiting the arctic coast of America from Greenland to Alaska, and a small portion of the Asiatic shore of Bering Strait. On the American shores they are found, in broken tribes, from East Greenland to the western shores of Alaska—never far inland, or south of the region where the winter ice allows seals to congregate. Even on hunting expeditions they never travel more than 30 m. from the coast. Save a slight admixture of European settlers, they are the only inhabitants of both sides of Davis Strait and Baffin Bay. They extend as far south as about 50° N. lat. on the eastern side of America, and in the west to 60° on the eastern shore of Bering Strait, while 55° to 60° are their southern limits on the shore of Hudson Bay. Throughout all this range there are no other tribes save where the Kenyann and Ugalene Indians (of western America) come down to the shore to fish. The Aleutians are closely allied to the Eskimo in habits and language. H. J. Rink divides the Eskimo into the following groups, the most eastern of which would have to travel nearly 5,000 m. to reach the most western: (1) The East Greenland Eskimo, few in number, every year advancing farther south, and coming into contact with the next section. (2) The West Greenlanders, civilized, living under the Danish crown, and extending from Cape Farewell to 74° N. lat. (3) The Northernmost Greenlanders—the Arctic Highlanders of Sir John Ross—confined to Smith, Whale, Murchison and Welstenholme Sounds, north of the Melville Bay glaciers. These are the most isolated and uncivilized of all the Eskimos—had no bows and arrows until about 1868. (4) The Labrador Eskimo, mostly civilized. (5) The Eskimo of the middle regions, occupying the coasts from Hudson Bay to Barter Island, beyond Mackenzie river, inhabiting a stretch of country 2,000 m. in length and 800 m. in breadth. (6) The Western Eskimo, from Barter Island to the western limits in America. (7) The Asiatic Eskimo.

The Eskimo are not a tall race, their height varying from 5 ft. 4 in. to 5 ft. 10 in., but men of 6 ft. are met. Both men and women are muscular and active, the former often inclining to fat. The faces of both have a pleasing, good-humoured expression, and not infrequently are even handsome. The typical face is broadly oval, flat, with fat cheeks; forehead not high, and rather receding; teeth good, though, owing to the character of the food, worn down to the gums in old age; nose very flat; eyes rather obliquely set, small, black and bright; head large, and covered with coarse black hair, which the women fasten up into a knot on the top, and the men clip in front and allow to hang loose and unkempt behind. Their skulls are of the mesocephalic type, the height being greater than the breadth; according to Davis, 75 is the index of the latter and 77 of the former. Some of the tribes slightly compress the skulls of their new-born children laterally (Hall), but this practice is a very local one. The men have usually a slight moustache, but no whiskers, and rarely any beard. The skin has generally a "bacony" feel, and when cleaned of the smoke, grease and other dirt—the accumulation of which varies according to the age of the individual—is only so slightly brown that red shows in the cheeks of the children and young women. The hands and feet are small and well formed. The Eskimo dress entirely in skins of the seal, reindeer, bear, dog, or even fox, the first two being, however, the most common. The men's and women's dress is much the same, a jacket suit, the trousers tucked into seal-skin boots. The jacket has a hood, which in cold weather is used to cover the head, leaving only the face exposed. The women's coat has a large hole for carrying a child and an absurd-looking tail behind, which is, however, usually tucked up. The trousers are usually ornamented with eider-duck neck feathers or embroidery of native dyed leather; their hoots, which are of white leather, or (in Greenland) dyed of various colours, reach over the knees, and in some tribes are very wide at the top, thus giving them an awkward appearance and a clumsy waddling walk. In winter two suits are worn, one with the hair inside, the other with it outside. They also sometimes wear shirts of bird-skins, and stockings of dog or young reindeer skins. Their clothes are very neatly made, fit beautifully, and are sewn with "sinew-thread," with a bone needle if a steel one cannot be had. In person the Eskimos are usually filthy, and never wash. Infants are, however, sometimes cleaned by being licked by their mother before being put into the bag of feathers which serves as their bed, cradle and blankets.

In summer the Eskimo live in conical skin tents, and in winter usually in half-underground huts of stone, turf, earth and bones, entered by a long tunnel-like passage, which can only be traversed on all fours. Sometimes, if residing temporarily at a place, they will erect neat round huts of blocks of snow with a sheet of ice for a window. In the roof are deposited their spare harpoons, &c.; and from it is suspended the steakite basin-like lamp, the flame of which, the wick being of moss, serves as fire and light. On one side of the hut is the bench which is used as sofa, seats and common sleeping place. The floor is usually very filthy, a pool of blood or a dead seal being often to be seen there. Ventilation is almost non-existent; and after the lamp has blazed for some time, the heat is all but unbearable. In the summer the wolfish-looking dogs lie outside on the roof of the huts, in the winter in the tunnel-like passage just outside the family apartment. The Western Eskimo build their houses chiefly of planks, merely covered on the outside with green turf. The same Eskimo have, in the more populous places, a public room for meetings. "Council chambers" are also said to exist in Labrador, but are only known in Greenland by tradition. Sometimes in south Greenland and in the Western Eskimo country the houses are made to accommodate several families, but as a rule each family has a house to itself.

The Eskimo are solely hunters and fishers, and derive most of their food from the sea. Their country allows of no cultivation; and beyond a few berries, roots, &c., they use no vegetable food. The seal, the reindeer and the whale supply the bulk of their food, as well as their clothing, light, fuel, and frequently also, when driftwood is scarce or unavailable, the material for various articles of domestic economy. Thus the Eskimo canoe is made of seal-skin stretched on a wooden or whalebone frame, with a hole in the centre for the paddler. It is driven by a bone-tipped double-bladed paddle. A waterproof skin or entail dress is tightly fastened round the mouth of the hole so that, should the canoe overturn, no water can enter. A skilful paddler can turn a complete somersault, boat and all, through the water.
The Eskimo women use a flat-bottomed skin luggage-boat. The Eskimo sledge is made of two runners of wood or bone—even, in one case on record, of frozen salmon (Maclure)—united by cross bars tied to the runners by a thong, and fastened down by from 4 to 8 dogs harnessed abreast. Some of their weapons are ingenious—in particular, the harpoon, with its detachable point to which an inflated sealskin is fastened. When the quarry is struck, the floating skin serves to tire it out, marks its course, and buoys it up when dead. The bird-spears, too, have a bladder attached, and points at the sides which strike the creature should the spear-head fail to wound. An effective bow is made out of whale’s rib. Altogether, with meagre material the Eskimo show great skill in the manufacture of their weapons. Meat is sometimes boiled, but, when it is frozen, it is often eaten raw. Blood, and the half-digested contents of the reindeer’s paunch, are also eaten; and sometimes, but not habitually, blubber. As a rule this latter is too precious: it must be kept for winter fuel and light. The Eskimo are enormous eaters; two will easily dispose of a seal at a sitting; and in Greenland, for instance, each individual has for his daily consumption, on an average, 2½ lb of flesh with blubber, and 1 lb of fish, besides mussels, berries, sea-weed, &c., to which in the Danish settlements may be added 2 oz of imported food. Ten pounds of flesh, in addition to other food, is not uncommonly consumed in a day in time of plenty. A man will lie on his back and allow his wife to feed him with tit-bits of blubber and flesh until he is unable to move.

The Eskimo cannot be strictly called a wandering race. They are nomadic only in so far that they have to move about from place to place during the fishing and shooting season, following the game in its migrations. They have, however, no regular property. They possess only the most necessary utensils and furniture, with a stock of provisions for less than one year, and these possessions never exceed certain limits fixed upon by tradition or custom. Long habit and the necessities of their life have also compelled those having food to share with those having none—a custom which, with others, has conduced to the stagnant conditions of Eskimo society and to their utter improvidence.

Their intelligence is considerable, as their implements and folk-tales abundantly prove. They display a taste for music, cartography and drawing, display no small amount of humour, are quick at picking up peculiar traits in strangers, and are painfully acute in detecting the weak points or ludicrous sides of their character. They are excellent mimics and easily learn the dances and songs of the Europeans, as well as their games, such as chess and draughts. They gamble a little—but in moderation, for the Eskimo, though keen traders, have a deep-rooted antipathy to speculation. When they offer anything for sale—say at a Danish settlement in Greenland—they always leave it to the buyer to settle the price. They have also a dislike to bind themselves by contract. Hence it was long before the Eskimo in Greenland could be induced to enter into European service, though when they do pass to almost the opposite extreme—they have no will of their own. Public licentiousness or indecency is rare among them. In their private life their morality is, however, not high. The women are especially erring; and in Greenland, at places where strangers visit, their extreme laxity of morals, and their utter want of shame, are not more remarkable than the entire absence of jealousy or self-respect on the part of their countrymen and relatives. Theft in Greenland is almost unknown; but the wild Eskimo make very free with strangers’ goods—though it must be allowed that the value they attach to the articles stolen is some excuse for the thieves. Among themselves, on the other hand, they are very honest—a result of their being so much under the control of public opinion. Lying is said to be as common a trait of the Eskimo as of other savages in their dealings with Europeans. They have naturally not made any figure in literature. Their folk-lore is, however, extensive, and that collected by Dr Rink shows considerable imagination and no mean talent on the part of the story-tellers. In Greenland and Labrador most of the natives have been taught by the missionaries to read and write in their own language. Altogether, the literature published in the Eskimo tongue is considerable. Most of it has been printed in Denmark, but some has been “set up” in a small printing-office in Greenland, from which about 280 sheets have issued, besides many lithographic prints. A journal (Alvagagilidituo nilinginarmik tusurarinnasassutum ikuvdluat,) i.e. “something for reading, accounts of all entertaining subjects”) has been published since 1861.

The Eskimo in Greenland and Labrador are, with few exceptions, nominally at least, Christians. The native religion is a vague animism, and consists of a belief in good and evil spirits, limited each to its own sphere; in a Heaven and Hell; and a childish faith is placed in the native wizards, who are regarded as intermediaries between mankind and the spirit-powers. The worship of the whale-spirit, so important a factor in their daily economy, is prevalent.

As regards language, the idiom spoken from Greenland to north-eastern Siberia is, with a few exceptions, the same; any difference is only that of dialect. It differs from the whole group of European languages, not merely in the sound of the words, but more especially, according to Rink, in the construction. Its most remarkable feature is that a sentence of a European language is expressed in Eskimo by a single word constructed out of certain elements, each of which corresponds in some degree to one of our words. One specimen commonly given to visitors to Greenland may suffice: Sanigiksinitarlakassurotranaryottogor, which is equivalent to “He says that you also will go away quickly in like manner and buy a pretty knife.” Here is one word serving in the place of 17. It is made up as follows: Savig a knife, ik pretty, sini buy, ariartok go away, asuar hasten, omar will, y in like manner, otth thou, tog also, og he says.

The Eskimo have no chiefs or political and military rulers. Fabricius concisely described them in his day: “Sine Dee, domino, reguntur consuetudine.” The government is mainly a family thing, though a man distinguished for skill in the chase, and for strength and swiftness, often has considerable power in the village. No political or social tie is recognized between the villages, though general good-fellowship seems to mark their relations. They never go to war with each other; and though revengeful and apt to injure an enemy secretly, they rarely come to blows, and are morbidly anxious not to give offence. Indeed, in their intercourse with each other, all Eskimo indulge in much hyperbolical compliment. But they are not without courage. On the Coppermine and Mackenzie rivers, where they sometimes come into collision with their American-Indian kinmen, they fight fiercely. Polygamy is rare, but the rights of the marriage are unrestricted. The Eskimo have intricate rules governing the ownership of property and the rights of the hunter. As a race they are singularly undemonstrative. When they meet each other they used to rub noses together, but this, though a common custom still among the wild Eskimo, is entirely abandoned in Greenland except for the petting of children. There is, in Greenland at least, no national mode of salutation, either on meeting or parting. When a guest enters a house, commonly not the least sign is made either by him or his host. On leaving a place they sometimes say “inudviilurlarize,” i.e. live well, and to a European “apornikatinat,” i.e. do not hurt thy head, viz. against the upper part of the doorway. The Eskimo, excluding the few on the Asiatic coast, are estimated at about 29,000.

ESKI-SHEHR—ESPARTOS SUR MER

ESKI-SHEHR, a town of Asia Minor, in the Kutaisi sanjak of the Brusa (Khadavendiklar) vilayet. It is a station on the Haidar Pasha-Angora railway, 194 m. from the former and 154 m. from Angora, and the junction for Konia; and is situated on the right bank of the Pursus Su (Tembris), a tributary of the Sakaria, at the foot of the hills that border the broad treeless valley. Pop. 20,000 (Moslems 15,000, Christians 5000). Eski-Shehr, i.e. "the old town," lies about a mile from the ruins of the ancient Phrygian Dorylaeum. The latter is mentioned in connexion with the wars of Lysimachus and Antigonus (about 302 B.C.), and frequently figures in Byzantine history as an imperial residence and military rendezvous. It was the scene of the defeat of the Turks under Kilij-Arslan by the crusaders in 1097, and fell finally to the Turks of Konia in 1176. The town is divided by a small stream into a commercial quarter on low ground, in which are the bazaars, khans and the hot sulphur springs (122° F.) which are mentioned as early as the 3rd century by Athenaeus; and a residential quarter on the higher ground. The town is noted for its good climate, the Pursus Su for the abundance of its fish, and the plain for its fertility. About 18 m. to the E. are extensive deposits of meerschaum. The clay is partly manufactured to local demand; and the greater part of the town, but the greater portion of its manufactures, finds its way to Europe and especially to Germany. The annual output is valued at £272,000.

See Murray's Hand. to Asia Minor (1863); V. Cuinet, Turquie d'Asie (Paris, 1894).

ESMARCH, JOHANNES FRIEDRICH AUGUST VON (1823-1908), German surgeon, was born at Tönning, in Schleswig-Holstein, on the 9th of January 1823. He studied at Kiel and Göttingen, and in 1846 became B. R. K. von Langeneck's assistant at the Kiel surgical hospital. He served in the Schleswig-Holstein War of 1848 as junior surgeon, and directed his attention to the subject of military surgery. He was taken prisoner, but afterwards exchanged, and was then appointed surgeon to a field hospital. During the truce of 1849 he qualified as Privatdozent at Kiel, but on the fresh outbreak of war he returned to the troops and was promoted to the rank of senior surgeon. In 1854 he became director of the surgical clinic at Kiel, and in 1857 head of the general hospital and professor at the university. During the Schleswig-Holstein War of 1864 Esmarch rendered important service to the town, and in 1865 he was appointed to the chair of Surgery at Kiel.

In 1866 he was called to Berlin as member of the hospital commission, and also to take the superintendence of the surgical work in the hospitals there. When the Franco-German War broke out in 1870 he was appointed surgeon-general to the army, and afterwards consulting surgeon at the great military hospital near Berlin. In 1872 he married Princess Henrietta of Schleswig-Holstein-Sonderburg-Augustenburg, aunt of the Empress Augusta Victoria. In 1888 a patent of nobility was conferred on him. He died at Kiel on the 23rd of February 1908. Esmarch was one of the greatest authorities on hospital management and military surgery. His Handbuch der kriegs chirurgischen Technik was written for a prize offered by the empress Augusta, on the occasion of the Vienna Exhibition of 1873, for the best handbook for the battlefield of surgical appliances and operations. This book is illustrated by admirable diagrams, showing the different methods of bandaging and dressing, as well as the surgical operations as they occur on the battlefield. Esmarch himself invented an apparatus, which bears his name, for keeping a limb nearly weightless during amputation. No part of Esmarch’s work is more widely known than that which deals with "First Aid," his First Aid on the Battlefield and First Aid to the Injured being popular manuals on the subject. The latter is the substance of a course of lectures delivered by him in 1881 to a "Samaritan School," the first of the kind in Germany, founded by Esmarch in 1881, in imitation of the St John’s Ambulance classes which had been organized in England in 1878. These lectures were very generally adopted as a manual for first aid students, edition after edition having been called for, and they have been translated into numerous languages, the English version being the work of H.R.H. Princess Christian. No ambulance course would be complete without a demonstration of the Esmarch bandage. It is a three-sided piece of linen or cotton, of which the base measures 4 ft. and the sides 2 ft. 10 in. It can be used folded or open, and applied in thirty-two different ways. It answers every purpose for temporary dressing and field-work, while its great recommendation is that the means for making it are always at hand.

ESNA, or ESNHER, a town of Upper Egypt on the W. bank of the Nile, 454 m. S.S.E. of Cairo by rail, the railway station being on the opposite side of the river. Pop. (1897) 16,000, mostly Copts. Esna, one of the healthiest towns in Egypt, is noted for its manufactures of pottery and its large grain and live stock markets. It formerly had a large trade with the Sudan. A caravan road to the south goes through the oasis of Kurkur. The trade, almost stopped by the Mahdist Wars, is now largely diverted by railway and steamboat routes. There is, however, considerable traffic with the oasis of Kharga, which lies almost due west of the town. Nearly in the centre of the town is the Ptolemaic and Roman temple of the ram-headed Khnum, almost buried in rubbish and houses. The interior of the pronaos is accessible to tourists, and contains the latest known hieroglyphic inscription, dating from the reign of Decius (A.D. 250-251).

In the neighbourhood are remains of Coptic buildings, including a subterranean church (discovered 1893) in the desert half a mile beyond the limits of cultivation. The name Esna is from the Coptic Σεν. By the Greeks the place was called Latopolis, from the worship here of the latus fish. In the persecutions under Diocletian A.D. 303, the Christians of Esna, a numerous body, suffered severely. In later times the town frequently served as a place of refuge for political exiles. The so-called Esna barrack across the Nile (built 1906-1908) is 30 m. higher up stream at Edfu.

ESOTERIC, having an inner or secret meaning. This term, and its correlative "esoteric," were first applied in the ancient Greek mysteries to those who were initiated (ἐσωτερικοί), and to those who were not (ἐξωτερικοί, outside), respectively. It was then transferred to a supposed distinction drawn by certain philosophers between the teaching given to the whole circle of their pupils and that containing a higher and secret philosophy which was reserved for a select number of specially advanced or privileged disciples. This was the doctrine of Lucian (Vit. Aug. 26) to Aristotle (φασοδίδωτοι, who, however, uses ἐσωτερικός). Ἐσωτερικός (Nic. Ethics) merely of "popular treatises." It was probably adopted by the Pythagoreans and was also attributed to Plato. In the sense of mystic it is used of a secret doctrine of theosophy, supposed to have been traditional among certain disciples of Buddhism.

ESPARTOS SUR MER, LES, the name given to the naval victory gained by King Edward III. of England over a Spanish fleet off Winchelsea, on the 29th of August 1350. Spanish ships had fought against England as the allies or mercenaries of France, and there had been instances of piratical violence between the trading ships of both nations. A Spanish merchant fleet was loading cargoes in the Flemish ports to be carried to the Basque coast. The ships were armed and had warships with them. They were all under the command of Don Carlos de la Cerda, a soldier of fortune who belonged to a branch of the Castilian royal family. On its way to Flanders the Spanish fleet had captured a number of English trading ships, and had thrown down anything that was Sati and Neith. In the neighbourhood are remains of Coptic buildings, including a subterranean church (discovered 1893) in the desert half a mile beyond the limits of cultivation. The name Esna is from the Coptic Σεν. By the Greeks the place was called Latopolis, from the worship here of the latus fish. In the persecutions under Diocletian A.D. 303, the Christians of Esna, a numerous body, suffered severely. In later times the town frequently served as a place of refuge for political exiles. The so-called Esna barrack across the Nile (built 1906-1908) is 30 m. higher up stream at Edfu.
He might easily have avoided the English if he had kept well out in the Channel. But he relied on the size and strength of his 40 large ships, and in expectation of an encounter he recruited a body of mercenaries—mostly crossbowmen—in the Flemish ports. In the afternoon of the 29th of August he bore down boldly on King Edward's ships at anchor at Winchelsea. When the Spaniards hove in sight, the king was sitting on the deck of his ship, with his knights and nobles, listening to his minstrels who played German airs, and to the singing of Sir John Chandos. When the look-out in the tops reported the enemy in sight, the king and his company drank to one another's health, the trumpet was sounded, and the whole line stood out. All battles at that time, whether on land or sea, were finally settled by stroke of sword. The English steered to board the Spaniards. The king's own ship was run into by one of the enemy with such violence that both were damaged, and she began to sink. The Spaniard stood on, and the "Cog Thomas" was laid alongside another, which was carried by boarding. It was high time, for the king and his following had barely reached the deck of the Spaniard before the "Cog Thomas" went to the bottom. Other Spaniards were taken, but the fight was hot. La Cerda's crossbowmen did much execution, and the higher-built Spaniards were able to drop bars of iron or other weights on the lighter English vessels, by which they were damaged. The conflict was continued till twilight. At the close the large English vessel called "La Salle du Roi," which carried the king's household, and was commanded by the Fleming, Robert of Namur, afterwards a knight of the Garter, was grappled by a big Spaniard, and was being dragged off by him. The crew called loudly for a rescue, but were either not heard or, if heard, could not be helped. The "Salle du Roi" would have been taken if a Flemish squire of Robert of Namur, named Hannequin, had not performed a great feat of arms. He boarded the Spaniard and cut the halyards of her mainsail with his sword. The Spaniards were surprised, and a great many were killed. Don Gonzalo de Zumalacarregui, whose duty it was to superintend the armament of the king, called upon Don Mariano de Guavil, his assistant, to act as a leader and adviser. In November 1836 he again forced the Carlists to raise the siege of Bilbao. His troops included the British legion under Sir de Lacy Evans. This success turned the tide of war against Don Carlos, who vainly attempted a raid towards Madrid. Espartero was soon at his heels, and obliged him to hurry northwards, after several defeats. In 1839 Espartero carefully opened up negotiations with Maroto and the principal Carlist chiefs of the Basque provinces. These ended in their accepting his terms under the famous convention of Vergara, which secured the recognition of their ranks and titles for nearly 1000 Carlist officers. Twenty thousand Carlist volunteers laid down their arms at Vergara; only the irreconcilables led by Cabrera held out for a while in the central provinces of Spain. Espartero soon, however, in 1840, stamped out the last embers of the rising, which had lasted seven years. He was styled "El pacificador de España," was made a grandee of the first class, and received the title of Duke of Luchana.

During the last three years of the war Espartero, who had been elected a deputy, exercised from his distant headquarters such influence over Madrid politics that he twice hastened the fall of the cabinet, and obtained office for his own friends. At the close of the war the queen regent and her ministers attempted to elbow out Espartero and his followers, but a pronunciamiento ensued in Madrid and other large towns which culminated in the marshal's accepting the post of prime minister. He soon became virtually a dictator, as Queen Christina took offence at his popularity and resigned, leaving the kingdom very soon afterwards. Directly the Cortes met they elected Espartero regent by 179 votes to 103 in favour of Arguelles, who was appointed guardian of the young queen. For two years Espartero ruled Spain in accordance with his Radical and conciliatory dispositions, giving special attention to the reorganization of the administration, taxation, and finances, declaring all the estates of the church, congregations, and religious orders to be national property, and suppressing the dijesa, or tenth. He suppressed the Republican risings with as much severity as he did the military pronunciamientos of
Generals Concha and Diego de León. The latter was shot in Madrid. Espartero crushed with much energy a revolutionary rising in Barcelona, but on his return to Madrid was so coldly welcomed that he perceived that his prestige was on the wane. The advanced Progressists coalesced with the partisans of the ex-regent Christina to promote pronunciamientos in Barcelona and many cities. The rebels declared Queen Isabel of age, and, led by General Narváez, marched upon Madrid. Espartero, deeming resistance useless, embarked at Cadiz on the 30th of July 1843 for England, and lived quietly apart from politics until 1848, when a royal decree restored to him all his honours and his seat in the senate. He retired to his house in Logroño, which he left six years later, in 1854, when called upon by the queen to take the lead of the powerful Liberal and Progressist movement which prevailed for two years. The old marshal vainly endeavoured to keep his own Progressists within bounds in the Cortes of 1854-1856, and in the great towns, but their excessive demands for reforms and liberties played into the hands of a clerical and reactionary court and of the equally retrograde governing classes. The growing ambition of General O'Donnell constantly clashed with the views of Espartero, until the latter, realizing, resigned for Logroño, after warning the queen that a conflict was imminent between O'Donnell and the Cortes, backed by the Progressist militia. O'Donnell's pronunciamiento in 1856 put an end to the Cortes, and the militia was disarmed, after a sharp struggle in the streets of the capital. After 1856 Espartero resolutely declined to identify himself with active politics, though at every stage in the onward march of Spain towards more liberal and democratic institutions he was asked to take a leading part. He refused to allow his name to be brought forward as a candidate when the Cortes of 1868, after the Revolution, sought for a ruler. Espartero, strangely enough, adopted a laconic phrase when successive governments on their advent to power invariably addressed themselves to the venerable champion of liberal ideas. To all— to the Revolution of 1868, the Constituent Cortes of 1869, King Amadeus, the Federal Republic of 1873, the nameless government of Marshal Serrano in 1874, the Bourbon restoration in 1875—he simply said: "Cumplas, es voluntad nacional" ("Let the national will be accomplished"). King Amadeus made him prince of Vergara. The Restoration raised a statue to him near the gate of the Retiro Park in Madrid. Spaniards of all shades, except Carlists and Ultramontanes, paid homage to his memory when he passed away at his Logroño residence on the 8th of January 1879. His tastes were singularly modest, his manners rather reserved, but always kind and considerate for humble folk. He was a typical Spanish soldier-politician, though he had more of the better traits of the soldier born and bred than of the arts of the statesman. His military instincts did not always make it easy for him to accommodate himself to courtiers and professional politicians. (A. E. H.)

**ESPARTO**, or **SPANISH GRASS**, *Stipa tenacissima*, a grass resembling the ornamental feather-grass of gardens. It is indigenous to the south of Spain and the north of Africa (where it is known as Halfa or Alfa), and is especially abundant in the sterile and rugged parts of Murcia and Valencia, and in Algeria, flourishing best in sandy, ferruginous soils, in dry, sunny situations on the sea coast. Pliny (V.H. xi. 23) described what appears to have been the same plant under the name of sparthes, whence the designation *campus spartarius* for the region surrounding New Carlage. It attains a height of 3 or 4 ft. The stems are cylindrical, and clothed with short hair, and grow in clusters of from 2 to 10 ft. in circumference; when young they serve as food for cattle, but after a few years' growth acquire great toughness of texture. The leaves vary from 6 in. to 3 ft. in length, and are grey-green in colour; on account of their tenacity of fibre and flexibility they have for centuries been employed for the making of ropes, sandals, baskets, mats, and other articles. Ships' cables of esparto, being light, have the quality of floating on water, and have long been in use in the Spanish navy.

Esparto leaves contain 56% by weight of fibre, or about 10% more than straw, and hence have come into requisition as a substitute for linen rags in the manufacture of paper. For this purpose they were first utilized by the French, and in 1857 were introduced into Great Britain. When required for paper-making the leaves should be gathered before they are quite matured; if, however, they are obtained too young, they furnish a paper having an objectionable semi-transparent appearance. The leaves are gathered by hand, and from 2 to 3 cwt. may be collected in a day by a single labourer. They are generally obtained during the dry summer months, as at other times their adherence to the stems is so firm as often to cause the uprooting of the plants in the attempt to remove them. Esparto may be raised from seed, but cannot be harvested for twelve or fifteen years after sowing.

Another grass, *Lygeum Spartum*, with stiff rush-like leaves, growing in rocky soil on the high plains of countries bordering on the Mediterranean, especially of Spain and Algeria, is also a source of esparto.

For the processes of the paper manufacturer esparto is used in the dry state, and without cutting; roots and flowers and stray weeds are first removed, and the material is then boiled with caustic soda, washed, and bleached with chlorine solution. Subsequently it should be made to adapt esparto for use in the coarser textile fabrics. Messrs. A. H. Proctor in 1877 directed attention to the composition of the slags resulting from the burning of esparto, which they found to be strikingly similar to that of average medical bottle glass, the latter yielding on analysis 66-3% of silica and 25-7% of alkalies and alkaline earths, and the slag 64.6 and 27.45% of the same respectively.

**ESPERANCE**, a small seaport on a fine natural harbour on the south coast of West Australia, 275 m. north-east from Albany. It is a summer resort, and in the neighbourhood are interesting caves. Its importance as a seaport is due to its being on the high road between the eastern states and the gold-fields, and the nearest place for the shipment of gold from the Coolgardie fields.

**ESPERANTO**, an artificial international auxiliary language (see Universal Languages), first published in 1887, seven years after the appearance of its predecessor Volapük (q.v.), which it has now completely supplanted. Its author was a Russian physician, Dr. L. Zamenhof, born in 1859 at Bielostok, where the spectacle of the four races—each speaking different languages—which inhabited Russia (Russians, Poles, Germans and Jews) was early dated to him of remedying the evil by the introduction of a neutral language, standing apart from the existing national languages. His first idea was to resuscitate some dead language. Then he tried to construct a new language on an a priori basis. At the same time he made what he appears to have considered the great discovery that the bulk of the vocabulary of a language consists not of independent roots, but of compounds and derivatives formed from a comparatively small number of roots.

At first he tried to construct his roots a priori by arbitrary combinations of letters. Then he fell back on the plan of taking his roots ready-made from existing languages, as the inventor of Volapük had done before him. But instead of taking them mainly from one language, he has selected them from the chief European languages, but not impartially. Like all inventors of artificial languages, he is more ready to experiment with foreign languages than with his own; and hence the Slavonic roots in Esperanto are much less numerous than those taken from the other European languages. Here his choice has been to some extent guided by the fact that he is a Freemason, although he has not fully grasped the importance of the principle of maximum internality, so well worked out in the latest rival of Esperanto—Idiom Neutral (see Universal Languages). Thus he adopts a large number of international words—generally unaltered except in spelling—such as teatr, tabak, even when it would be easy to form equivalent terms from the roots already existing in the language. Where there is no one international word, he selects practically at random, keeping, however, a certain balance between the Romance words, taken chiefly from Latin (amen) and French (troisar), on the one hand, and the Germanic on the other, the latter being taken sometimes
from German (nur, "only"), sometimes from English, the words being generally written more or less phonetically (raj - right). Most of the Germanic words are badly chosen from the international point of view. Thus the German word quoted above would not be intelligible to any one ignorant of German. Indeed, from the international point of view all specially German words ought to be excluded, or else reduced to the common Germanic form; thus trink ought to be made into drink, the t being a specially German modification of the d, preserved not only in English but in all the remaining Germanic languages. This incongruous mixture of languages is not only jarring and repulsive, but adds greatly to the difficulty of mastering the vocabulary for the polyglot as well as the monolingual learner.

The inventor has taken great pains to reduce the number of his roots to a minimum; there are 2642 of them in his dictionary, the Universala Vortaro (from Ger. Wort, "word"), which does not include such international words as poeta, telefono; these the learner is supposed to recognize and learn without help. The most eccentric feature of the vocabulary, and the one to which it owes much of its brevity, is the extensive use of the prefix mal- to reverse the meaning of a word, as in malamiko, "enemy," and even malbona, "bad." The phonology of the language is very simple. The vowels are only five in number, a, e, i, o, u, used without any distinction of quantity, as in Russian. There are six diphthongs, expressed by an unnecessarily complicated notation. The consonant-system is simple enough in itself, but is greatly complicated in writing by the excessive and mostly unnecessary use made of diacritical letters not only for simple sounds but also for consonant-groups. e is used for ts, as in Polish.

The grammar is, like that of Volapük, partly borrowed from existing languages, partly a priori and arbitrary. The use of the final vowels belongs to the latter category. The use of -a to indicate adjectives and of -o to indicate nouns as in kara amiko, "dear (male) friend," is a source of confusion to those familiar with the Romance languages, and has proved a bar to the diffusion of Esperanto among the speakers of these languages. On the other hand, the following paradigm will show how faithfully Esperanto can reproduce the defects of conventional European grammar:

<table>
<thead>
<tr>
<th>Nominative</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>la bona patro</td>
<td>la bonaj patroj</td>
</tr>
<tr>
<td>la bonan patron</td>
<td>la bonanaj patronoj</td>
</tr>
</tbody>
</table>

It is difficult to see why the accusative should be kept when all the other cases are replaced by prepositions.

The verb is better than the noun. Its inflections are as present, -is, pretense, -as future, -as conditional, -a imperative and subjunctive, -i infinitive, together with the following participles:

<table>
<thead>
<tr>
<th>Active</th>
<th>Passive</th>
</tr>
</thead>
<tbody>
<tr>
<td>-anta</td>
<td>-ata</td>
</tr>
<tr>
<td>-anta</td>
<td>-ata</td>
</tr>
<tr>
<td>-anta</td>
<td>-ata</td>
</tr>
</tbody>
</table>

The inventory of the forty-five correlatives pronouns, adjectives and adverbs is also elaborate and ingenious.

Much ingenuity is displayed in the syntax, as well as some handy simplifications. But, on the other hand, there is much in it that is fanciful, arbitrary and vague, as in the use of the definite article—where the author has unfortunately followed French rather than English usage—and in the moods of the verb.

The following specimens will show the general character of this easy-flowing but somewhat heavy and monotonous language—"bad Italian," as it is called by its detractors:

Patro nia, kiu estas en la ĉielo, sankta estu via nomo; venu regeo via; estu volo via, kiel en la ĉielo, tiel ankaŭ sur la tero.

Panon nian ĵutagan donu al ni hodiaŭ; kaj pardonu al ni judojn nian, kiel ni ankaŭ pardonas al ni ĵudantoj; kaj ne konduku ni en tenton, sed liberu ni de la malbono.

Estimat Sinjoro. Per tiu ĉi liireto mi havas la honoron prezentii al vi la lingvon internacian Esperanto. Esperanto tute ne havas la intenco malfortigi la lingvon naturan de ia popolo. Gi devas nur servi por la rilato interna kaj por tiuj verkoj al produktado, kiuj interesas igual la tutan muton.

In summing up the merits and defects of Esperanto we must begin by admitting that it is the most reasonable and practical artificial language that has yet appeared. Its inventor has had the double advantage of being able to profit by the mistakes of his predecessors, and of being himself, by force of circumstances, a better linguist. It must further be admitted that he has made as good a use of these advantages as was perhaps possible without systematic training in scientific philology in its widest sense. This last defect explains why the enthusiasm which his work has excited in the great world of linguistic dilettantes has not been shared by the philologists: in spite of its superiority to Volapük, they see in it the same radical defects. Whether they are rash or not in predicting for it a similar fate, remains to be seen. The Esperantists, warned by the fate of Volapük, have defended the wise policy of suppressing all internal dissension by submitting to the dictatorialship of the inventor, and so presenting a united front to the enemy. One thing is clear: either Esperanto must be taken as it is without change, or else it must crumble to pieces; its failure to work out consistently the principle of the maximum of internationality for its root-words is alone enough to condemn it as hopelessly antiquated even from the narrow point of view which regards "international" as synonymous with "European"—a view which political development in the Far East has made equally obsolete.

ESPINAY, TIMOLÉON D' (1580–1644), French soldier, was the eldest of the four sons of François d’Espinay, seigneur de Saint-Luc (1534–1597), and was himself marquis de Saint-Luc. In 1603 he accompanied Sully in his embassy to London. In 1622, in his capacity as vice-admiral of France, he gained some advantages over the defenders of La Rochelle, obliging the Huguenot commander, Benjamin de Rohan, seigneur de Soubise, to evacuate the islands of Ré and Oléron. In 1627 he was named lieutenant-general of Guise and marshal of France.

ESPINEL, VICENTE MARTINEZ (1551–1624), Spanish poet and novelist, was baptized on the 28th of December 1551, and educated at Salamanca. He was expelled from the university in 1572, and served as a soldier in Flanders, returning to Spain in 1584 or thereabouts. He took orders in 1587, and four years later became chaplain at Ronda, absent himself from his living, and was deprived of his cure; but his musical skill obtained for him the post of choirmaster at Plasencia. His Diversas Rimas (1591) are undeniably good examples of technical accomplishment and caustic wit. Espinel, however, survives as the author of a clever picareque novel entitled Relaciones de la vida del Escudero Marcos de Obrégón (1618). It is, in many passages, an autobiography of Espinel with picturesque embellishments. Marcos is not a chivalrous "esquire," but an adventurer who seeks his fortune by attaching himself to great men; and the object of the author is to warn young men against such careers. Apart from the underlying condition of the hero, the book contains curious anecdotes concerning prominent contemporaries, and the episodic stories are told with great spirit; the style is extremely correct, though somewhat diffuse. Le Sage has not scrupled to borrow from Marcos de Obrégón many of the incidents and characters in Gil Blas—a circumstance which induced Isla to give to his Spanish translation of Le Sage’s work the jesting title, Gil Blas restored to his Country and his Native Tongue. In the 1775 edition of the Siècle de Louis XIV. Voltaire grossly exaggerates in saying that Gil Blas is taken entirely from Marcos de Obrégón. Espinel was a clever musician and added a fifth string to the guitar. He revived the measure known as décimas or espinelas, consisting of a stanza of ten octosyllabic lines. Most of the poems which he left in manuscript remain unpublished owing to their licentious character.
ESPIRITO SANTO—ESQUIRE

BIBLIOGRAPHY.—J. Perez de Guzmán’s edition of Marcos de Obregón (Barcelona, 1881) includes a valuable introduction; Léopold Claretie, Le Sage romancier (Paris, 1890), discusses exhaustively the question of Le Sage’s indebtedness to Espinel. For some previously unpublished poems see Pedro Salvá y Mallén, Catálogo de la biblioteca de Salas (Valencia, 1872).

ESPIRITO SANTO, a maritime state of Brazil, bounded N. by Bahía, E. by the Atlantic Ocean, S. by Rio de Janeiro, and W. by Minas Geraes. Pop. (1890) 135,997; (1900) 209,785; area, 17,316 sq. m. With the exception of Sergipe it is the smallest of the Brazilian states. The western border of the state is traversed by low ranges of mountains forming a northward continuation of the Serra do Mar. The longest and most prominent of these ranges, which are for the most part the eastern escarpments of the great Brazilian plateau, is the Serra dos Aymores, which extends along fully two-thirds of the western frontier. Farther S. the ranges are much broken and extend partly across the state toward the seacoast; the more prominent are known as the Serra do Espigão, Serra da Chibata, Serra dos Pilões and Serra dos Purys. The eastern and larger part of the state is a plateau, in great part low and swampy, with large areas of sand barred and broken by hills and groups of ranges of hills. With the exception of these sandy plains the country is heavily forested, even the mountain sides being covered with vegetation to their summits. The northern and southern parts are fertile, but the central districts are comparatively poor. The coastal plain comprises a sandy, unproductive belt immediately on the coast, back of which is a more fertile tertiary plain, well suited, near the higher country, to the production of sugar and cotton. The inland valleys and slopes are very fertile and heavily forested, and much of the Brazilian export of rosewood and other cabinet woods is drawn from this state. There is only one good bay on the coast, that of Espirito Santo, on which the port of Victoria is situated. The river-mouths are obstructed by sand bars and admit small vessels only. The principal rivers of the state are the Mucury, which rises in Minas Geraes and forms the boundary line with Bahía, the Itaunas, São Domingos, São Mathews, Doce, Timbuhy, Santa Maria, Jucú, Benevente, Itapemirim, and Itabapoana, the last forming the boundary line with Rio de Janeiro. Below Doce the Math-plan, and Itapemirim rise in Minas Geraes and flow entirely across the state. The lower courses of these rivers are generally navigable, that of the Rio Doce for a distance of 90 m. The climate of the coastal zone and deeper valleys is hot, humid and unhealthy, malarial fevers being prevalent. In the higher country the temperature is lower and the climate is healthy. Espirito Santo is almost exclusively agricultural, sugar-cane, coffee, rice, cotton, tobacco, mandioca and tropical fruits being the principal products. Agriculture is in a very backward condition, however, and the state is classed as one of the poorest and most unprogressive in the republic. The rivers and shallow coast waters are well stocked with fish, but there are no fishing industries worthy of mention. There are three railway lines in operation in the state—one running from Victoria to Cachoeira do Itapemirim (50 m.), and thence, by another line, to Santo Eduardo in Rio de Janeiro (58 m.), where connexion is made with the Lepoldina system running into the national capital, and a third running north-westly from Victoria to Diamantina, Minas Geraes, about 450 m. The chief cities and towns of the state, with their populations in 1890, are Victoria, São Mathews (municipality, 7761) on the same name 16 m. from the sea, Serra (municipality, 6274), Guarapary (municipality, 5340), a small port S. by W. of the capital, Conceição da Barra (municipality, 5628), the port of São Mathews and Cachoeira do Itapemirim (4049), an important commercial centre in the south.

Santo Espirito formed part of one of the original captaincies which were given to Vasco Fernandes Coutinho by the Portuguese crown. The first settlement (1535) was at the entrance to the bay of Espirito Santo, and its name was afterwards given to the bay and captnacy. It once included the municipality of Campos, now belonging to the state of Rio de Janeiro.

The islands of Trinidad and Martim Vaz, which lie about 715 m. E. of Victoria, belong politically to this state. They are uninhabited, but considerable importance is attached to the former because Great Britain has twice attempted to take possession of it. It rises 1550 ft. above sea-level and is about 6 m. in circumference, but it has no value other than that of an ocean cable station. An excellent description of this singular island is to be found in E. F. Knight’s Cruise of the “Alerte” (London, 1804).

ESPRONCEDA, José Ignacio JAVIER ORIOl ENCARNACION DE (1808–1842), Spanish poet, son of an officer in the Bourbon regiment, was born at or near Almendralejo de los Barros on the 25th of March 1808. On the close of the war he was sent to the preparatory school of artillery at Segovia, and later became a pupil of the poetLista, then professor of literature at St Matthew’s College in Madrid. In his fourteenth year he had attracted his master’s attention by his verses, and had joined a secret society. Sentenced to five years’ seclusion in the Franciscan convent at Guadalajara, he began an epic poem entitled Pelayo, of which fragments survive. He escaped to Portugal and thence to England, where he found the famous Teresa whom he had met at Lisbon; here, too, he became a student of Shakespeare, Milton and Byron. In 1830 he eloped to Paris, took part in the July revolution, and soon after joined the royalist party. In 1833 he returned to Spain and obtained a commission in the queen’s guards. This, however, he soon forfeited by a political song, and he was banished to Ceúllar, where he wrote a poor novel entitled Sancho Saldaña o el Castellano de Ceúllar (1834). He took an active part in the revolutionary risings of 1833 and 1836, and, on the accession to power of the Liberal party in 1840, was appointed secretary of legation at the Hague; in 1842 he was elected deputy for Almería, and seemed likely to play a great part in parliamentary life. But his constitution was undermined, and, after a short illness, he died at Madrid on the 23rd of May 1842. His poems, first published in 1840, at once gained for him a reputation which still continues undiminished.

The influence of Byron pervades Espronceda’s life and work. It is present in an ambitious variant on the Don Juan legend, El Estudiante de Salamanca, Elvira’s letter being obviously modelled on Julian’s letter in Don Juan; the Canción del Pirata is suggested by The Corsair; and the Byronic inspiration is not wanting even in the noble fragment entitled El Diablo Mundo. The greater part of the story of Un mendigo, in El Rey de Muerte, in El Verugo, and in the sombre pastoral, A Jarifa en una orga, Espronceda approves himself the most potent and original lyrical poet produced by Spain during the 19th century.

BIBLIOGRAPHY.—Obras poéticas y escritos en prosa (Madrid, 1884), edited by Blanca Espronceda de Escosura, the poet’s daughter (the second volume has not been published); E. Rodriguez Solis, Espronceda: su tiempo en la vida, y sus obras (Madrid, 1883); E. Piñeyro, El Romanticismo en España (Paris, 1904).

ESQUIRE (O. Fr. escuyer, Mod. Fr. écuyer, derived through the form escudier from Med. Lat. scutarius, “shield-bearer”), originally the attendant on a knight, whose helm, shield and lance he carried at the tournament or in the field of battle. The esquire ranked immediately below the knight bachelor, and his office was regarded as the apprentice stage of knighthood. The title was regarded as one of function, not of birth, and was not hereditary. In time, however, its original significance was lost sight of, and it came to be a title of honour, implying a rank between that of knight and valet or gentleman, as it technically still remains. Thus in the later middle ages esquire (armiger) took the customary designation of holders of knight’s fees who had become attached to the court of knighthood, surviving custom of entitling the principal landowner in a parish “the squier” (see Squire). Camden, at the close of the 16th century, distinguished four classes entitled to bear the style: (1) The eldest sons of knights, and their eldest sons, in perpetual succession; (2) the eldest sons of the younger sons of peers, and their eldest sons, in like perpetual succession; (3) esquires created by royal letters patent or other investiture, and their eldest sons; (4) esquires by office, e.g. justices of the peace and others who
bear any office of trust under the crown. To these the writer in the 3rd edition of the *Encyclopædia Britannica* (1757) added Irish peers and the eldest sons of British peers, who, though they bear courtesy titles, have in law only the right to be styled esquires. Officers of the king’s courts, and of the royal household, councillors at law and justices of the peace be described as esquires only “by reputation”; and justices of the peace have the title only as long as they are in commission; while certain heads of great landed families are styled “esquires” by prescription. “But the meaner ranks of people,” he adds indignantly, “who know no better, do often basely prostitute this title; and, to the great confusion of all rank and precedence, every man who makes a decent appearance, far from thinking himself in any way ridiculed by finding the superscription of his letters thus decorated, is fully gratified by such an address.”

It is clear, however, that the title of esquire was very loosely used at a much earlier date. On this point Selden is somewhat scornfully explicit. “To whomsoever, either by blood, place in the State or other eminency, we conceive some higher attribute should be given, than that sole Title of Gentleman, knowing yet the same hath no other honorary title legally fixed upon him, we usually style him an *esquire*, in such passages as require legally that his degree or state be mentioned; as especially in Indictments and Actions whereupon he may be outlawed. Those of other nations who are Barons or great Lords in their own Countries, and no knights, are in legal proceedings stiled with us, *Esquires* only. Some of our greatest Herald’s have their divisions of *Esquires* applied to this day. I leave them as I see them, where they may easily be found.” Coke, too, says that every one is entitled to be termed esquire who has the legal right to call himself a gentleman (*s. Institutes*, 688).

At the present time the following classes are recognized as esquires on occasions of ceremony or for legal purposes:—(1) All sons of peers and lords of parliament during their fathers’ lives, and the younger sons of such peers, &c., after their fathers’ deaths; the eldest sons of peers’ younger sons, and their eldest sons for ever. (2) Noblemen of all other nations. (3) The eldest sons of baronets and knights. (4) Persons bearing arms and the title esquire by express patent. (5) Esquires of the Bath and their eldest sons. (6) Barristers-at-law. (7) Justices of the peace and mayors while in commission or office. (8) The holders of any superior office under the crown. (9) Persons styled esquires by the sovereign in their patents, commissions or appointments. (10) Attorneys in colonies where the functions of counsel and attorney are united (in English solicitors are “gentlemens,” not “esquires”).

In practice, however, the title of esquire, now to all intents and purposes meaningless, is given to any one who “can bear the port, charge and countenance of a gentleman.” The word has followed the same course as that of “gentleman” (q.v.), and for very similar reasons. It is still not customary in Great Britain to address e.g. a well-to-do person engaged in trade as esquire at his shop; it would be offensive not to do so at his private residence. In America, on the other hand, the use of the word “esquire” is practically obsolete, “Mr” (“Mister” or “Master,” at this time the special title to a “gentleman”) being the general form of address.

**ESQUIROL, JEAN ÉTIENNE DOMINIQUE** (1772–1840), French alienist, was born at Toulouse on the 3rd of February 1772. In 1794 he became a pupil of the military hospital of Narbonne, and subsequently studied in Paris at the Salpêtrière under P. Pinel, whose assistant he became. In 1811 he was chosen physician to the Salpêtrière, and in 1817 he began a course of lectures on the treatment of the insane, in which he made such revelations of the abuses existing in the lunatic asylums of France that the government appointed a commission to inquire into the subject. Esquirol in this and other ways greatly assisted Pinel’s efforts for the introduction of humane methods. The asylums of Rouen, Nantes and Montpellier were built in accordance with his plans. In 1823 he became inspector-general of the university of Paris for the faculties of medicine, and in 1826 chief physician of the asylum at Charlestown. He died at Paris on the 13th of December 1840. Besides contributing to the *Dictionnaire des sciences médicales* and the *Encyclopédie des gens du monde*, Esquirol wrote *Des maladies mentales, considérées sous les rapports médical, hygiénique, et médico-légal* (2 vols., Paris, 1838).

**ESQUIROS, HENRI FRANÇOIS ALPHONSE** (1812–1876), French writer, was born in Paris on the 23rd of May 1812. After some minor publications he produced *L’Évangile du peuple* (1846), an exposition of the life and character of Jesus as a social reformer. This work was considered an offence against religion and decency, and Esquiros was fined and imprisoned. He was elected in 1850 as a social democrat to the Legislative Assembly, but was exiled in 1851 for his opposition to the Empire. Returning to France in 1860 he was again a member of the Legislative Assembly, and in 1876 was elected to the senate.

In 1808 at Versailles on the 15th of May 1876. He turned to account his residence in this place in *L’Anglais et la vie anglaise* (5 vols., 1859–1860). Among his most notable works on social subjects may be noted:—*Histoire des Montagnards* (2 vols., 1847): *Paris, ou les sciences, les institutions et les mœurs au XIX* siècle (2 vols., 1847); and *Histoire des martyrs de la liberté* (1851).

**ESS, JOHANN HEINRICH VAN** (1772–1847), German Catholic theologian, was born at Warburg, Westphalia, on the 15th of February 1772. He was educated at the Dominican gymnasium of his native town, and in 1790 entered, as a novice, the Benedictine abbey of Marienmünster, in the bishopric of Paderborn. His Benedictine name was Leander. He was priest at Schwelberg from 1799 to 1812, after which he became extraordinary professor of theology and joint-director of the teachers’ seminary at Marburg. In 1818 he received the doctorate of theology and of canonical law. In 1807, in conjunction with his cousin Karl van Ess, he had published a German translation of the New Testament, and, as its circulation was disowned by the Church, in 1816 he published a Spanish translation of his views, entitled *Ausser aus den heiligen Vater und apostolischen Schriften der katholischen Kirche über das notwendige und nützliche Bihilfen*. An improved edition of this tractate was published in 1816, under the title *Gedanken über Bibel und Bibliolere*, and in the same year appeared *Was war die Bibel der ersten Christen?*. In 1822 he published the first part of a German translation of the Old Testament, which was completed in 1836. In 1822 he resigned his offices at Marburg in order to devote his whole time to the defence of his views regarding Bible reading by the people, and to endeavour to promote the circulation of the scriptures. He was associated first with the Catholic Bible Society of Regensburg, and then with the British and Foreign Bible Society. He died at Affelderbach in the Odenwald on the 13th of October 1847.

**ESSAY, ESSAYIST** (Fr. *essai*, Late Lat. *exagium*, a weighing or balance; *exigere*, to examine; the term in general meaning any trial or effort). As a form of literature, the essay is a composition of moderate length, usually in prose, which deals in an easy, cursory way with the external conditions of a subject, and, in contrast, with that subject only as it affects the writer. Dr Johnson, himself an eminent essayist, defines an essay as “an irregular, undigested piece”; the irregularity may perhaps be admitted, but want of thought, that is to say lack of proper mental digestion, is certainly not characteristic of a fine example. It should, on the contrary, always be the brief and light result of experience and profound meditation, while “undigested” is the last epithet to be applied to the essays of Montaigne, Addison or Lamb. Bacon said that the Epistles of Seneca were “essays,” but this can hardly be allowed. Bacon himself goes on to admit that “the word is late, though the thing is ancient.” The word, in fact, was invented for this species of writing by Montaigne, who merely meant that these were experiments in
a new kind of literature. This original meaning, namely that these pieces were attempts or endeavours, feeling their way towards the expression of what would need a far wider space to exhaust, was lost in England in the course of the eighteenth century. This is seen by the various attempts made in the nineteenth century to coin a word which should express a still smaller work, as distinctive in comparison with the essay as the essay is by the side of the monograph; none of these linguistic experiments, such as essayette, essaykin (Thackeray) and essayslet (Helps) have taken hold of the language. As a matter of fact, the journalistic word article covers the lesser form of essay, although not exhaustively, since the essays in the monthly and quarterly reviews, which are fully as extended as an essay should ever be, are frequently termed “articles,” while many “articles” in newspapers, dictionaries and encyclopaedias are in no sense essays. It may be said that the idea of a detached work is combined with the word “essay,” which should be neither a section of a dissertation nor a chapter in a book which aims at the systematic development of a story. Locke’s Essay on the Human Understanding is not an essay at all, or cluster of essays, in this technical sense, but refers to the experimental and tentative nature of the inquiry which the philosopher was undertaking. Of the curious use of the word so repeatedly made by Pope mention will be made below.

The essay, as a species of literature, was invented by Montaigne, who had probably little suspicion of the far-reaching importance of what he created. In his dejected moments, he turned to rair at what he had written, and to call his essays “iniquities” and “sottises.” But in his own heart he must have been well satisfied with the new and beautiful form with which he had added to literary tradition. He was perfectly aware that he had devised a new thing; that he had invented a way of communicating himself to the world as a type of human nature. He designed it to carry out his peculiar object, which was to produce an accurate portrait of his own soul, not as it was yesterday or will be to-morrow, but as it is to-day. It is not often that we can dare with any approach to accuracy the arrival of a new class of literature into the world, but it was in the month of March 1571 that the essay was invented. It was started in the second story of the old tower of the castle of Montaigne, in a study to which the philosopher withdrew for that purpose, surrounded by his books, close to his chapel, sheltered from the excesses of a fatiguing world. He wrote slowly, not systematically; it took nine years to finish the two first books of the essays. In 1574 the manuscript of the work, so far as it was then completed, was nearly lost, for it was confiscated by the pontifical police in Rome, where Montaigne was residing, and was not returned to the author for four months. The earliest imprint saw the light in 1580, at Bordeaux, and the Paris edition of 1588, which is the fifth, contains the final text of the great author. These dates are not negligible in the briefest history of the essay, for they are those of its revelation to the world of readers. It was in the delightful chapters of his new, strange book that Montaigne invented the essay as we know it, with constant digressions and interruptions, about the world as it appears to the individual who writes. The Essais were instantly welcomed, and few writers of the Renaissance had so instant and so vast a popularity as Montaigne. But while the philosophy, and above all the grace stoical, of the great master were admired and copied in France, the exact shape in which he put down his thoughts, in the exquisite negligence of a series of essays, was too delicate to tempt an imitator. It is to be noted that neither Charron, nor Mlle de Gournay, his most immediate disciples, tried to write essays. But Montaigne, who liked to fancy that the Eyquem family was of English extraction, had spoken affably of the English people as his “cousins,” and it has always been admitted that his genius has an affinity with the English. He was early read in England, and certainly by Bacon, whose the second great name connected with this form of literature. It was in 1597, only five years after the death of Montaigne, that Bacon published in a small octavo the first ten of his essays. These he increased to 38 in 1612 and to 58 in 1625. In their first form, the essays of Bacon had nothing of the fulness or grace of Montaigne’s; they are meagre notes, scarcely more than the headings for discourses. It is possible that when he wrote them he was not yet familiar with the style of his predecessor, which was first made popular in England, in 1603, when Florio published that translation of the Essais which Shakespeare unquestionably read. In the later editions Bacon greatly expanded his theme, but he never reached, or but seldom, the freedom and ease, the seeming formlessness held in by an invisible chain, which are the glory of Montaigne, and distinguish the typical essayist. It would seem that at first, in England, as in France, no lesser writer was willing to adopt a title which belonged to so great a presence as that of Bacon or Montaigne. The one exception was Sir William Cornwallis (d. 1631), who published essays in 1600 and 1617, of slight merit, but popular in their day. No other English essayist of any importance appeared until the Restoration, when Abraham Cowley wrote eleven "Several Discourses by Way of Essays," which did not see the light until 1668. He interspersed with his prose, translations and original pieces in verse, but in other respects Cowley keeps much nearer to Bacon to the form of Montaigne. Cowley’s essay “Of Myself” is a model of what these little compositions should be. The name of Bacon inspires awe, but it is really not he, but Cowley, who is the father of the English essay; and it is remarkable that he has had no warmer panegyrists than his great successors, Charles Lamb and Macaulay. Towards the end of the century, Sir George Mackenzie (1636-1691) wrote witty moral discourses, which were, however, essays rather in name than form. Whenever, however, we reach the eighteenth century, we find the essay suddenly became a dominant force in English literature. It made its appearance almost as a new thing, and in combination with the earliest developments of journalism. On the 12th of April 1709 appeared the first number of a penny newspaper, entitled the Tatler, a main feature of which was to amuse and instruct fashionable readers by a series of short papers dealing with the manifold occurrences of life, quicquid agunt homines. But it was not until Steele, the founder of the Tatler, was joined by Addison that the eighteenth-century essay really started upon its course. It displayed at first, and indeed it long retained, a mixture of the manner of Montaigne with that of La Bruyère, combining the form of the pure essay with that of the character-study, as modelled on Theophrastus, which had been so popular in England throughout the seventeenth century. Addison’s early Tatler portraits, in particular such as those of “Tom Folio” and “Ned Softly,” are hardly essays. But Steele’s “Recollections of Childhood” is, and here we may observe the type on which Goldsmith, Lamb and R. L. Stevenson afterwards worked. In January 1711 the Tatler came to an end, and was almost immediately followed by the Spectator, and in 1713 by the Guardian. These three newspapers are storehouses of admirable and typical essays, the majority of them written by Steele and Addison, who are the most celebrated eighteenth-century essayists in England. Later in the century and among other less successful experiments, appeared Fielding’s essays in the Covent Garden Journal (1752) and Johnson’s in the Rambler (1750), the Adventurer (1753) and the Idler (1759). There followed a great number of polite journals, in which the essay was treated as “the bow of Ulysses in which it was the fashion for men of rank and genius to try their strength.” Goldsmith reached a higher level than the Chesterfields and Bonnel Throntons had dreamed of, in the delicious sections of his Citizen of the World (1760). After Goldsmith, the eighteenth-century essay declined into tamer hands, and passed into final futility with the pedantic Richard Cumberland and the sentimental Henry Mackenzie. The corpus of eighteenth-century essayists is extremely voluminous, and their reprinted works fill many volumes. There is, however, a great sameness about all but the very best of them, and in no case do they surpass Addison in freshness, or have they ventured to modify the form he adopted for his lucubrations. What has survived of them all is the lightest portion, but it should not be forgotten...
that a very large section of the essays of that age were deliberately didactic and “moral.” A great revival of the essay took place during the first quarter of the nineteenth century, and foremost in the history of this movement must always be placed the name of Charles Lamb. He perceived that the real business of the essay, as Montaigne had conceived it, was to be largely personal. The famous Essays of Elia began to appear in the London Magazine for August 1820, and proceeded at fairly regular intervals until December 1822; early in 1823 the first series of them were collected in a volume. The peculiarity of Lamb’s style as an essayist was that he threw off the Addisonian and still more the Johnsonian tradition, which had become a burden that crushed the life out of each conventional essay, and that he boldly went back to the rich verbiage and brilliant imagery of the seventeenth century for his inspiration. It is true that Lamb had great dexterity of style, and that, when he pleases, he can write so like Steele that Steele himself might scarcely know the difference, yet in his freer flights we are conscious of more exalted masters, of Milton, Thomas Browne and Jeremy Taylor. He succeeded, moreover, in reaching a poignant note of personal feeling, such as is not to be found in the work of most of his predecessors.

In 1844; and in 1825, the Spectator and the Companion (1819) and the Spectator (1828). The sermons, letters and pamphlets of Sydney Smith were really essays of an extended order. In Hazlitt and Francis Jeffrey we see the form and method of the essay beginning to be applied to literary criticism. The writings of De Quincey are almost exclusively essays, although many of the most notable of them, under his vehement pen, have far outgrown the limits of the length laid down by the most indulgent formalist. His biographical and critical essays are interesting, but they are far from being trustworthy models in form or substance. In a sketch, however rapid, of the essay in the nineteenth century, prominence must be given to the name of Macaulay. His earliest essay, that on Milton, appeared in the Edinburgh Review in 1825, very shortly after the revelation of Lamb’s genius in “Elia.” No two products cast in the same mould could, however, be more unlike in substance. In the hands of Macaulay the essay ceases to be a confession or an autobiography; it is strictly impersonal, it is literary, historical or controversial, vigorous, trenchant and full of party prejudice. The periodical publication of Macaulay’s Essays in the Edinburgh Review went on until 1844; when we cast our eyes over this mass of brilliant writing we observe with surprise that it is almost wholly contentious. Nothing can be more remarkable than the difference in this respect between Lamb and Macaulay, the former for ever demanding, even cajoling, the sympathy of the reader, the latter scanning the horizon for an enemy to controvert. In later times the essay in England has been cultivated in each of these ways, by a thousand journalists and authors. The “leaders” of a daily newspaper are examples of the popularisation of essays, and they point to the danger which now attacks it, that of producing a purely ephemeral or even momentary species of effect. The essay, in its best days, was intended to be as lasting as a poem or a historical monograph; it aimed at being one of the most durable and precious departments of literature. We still occasionally see the production of essays which have this more ambitious aim; within the last quarter of the nineteenth century the essays of R. L. Stevenson achieved it. His Familiar Studies are of the same class as those of Montaigne and Lamb, and he approached far more closely than any other contemporary to their high level of excellence. We have seen that the tone of the essay should be personal and confidential; in Stevenson’s case it was characteristically so. But the voices which please the public in a strain of pure self-study are few at all times, and with the cultivation of the analytic habit they tend to become less original and attractive. It is possible that the essay may die of exhaustion of interest, or may survive only in the modified form of accidental journalism.

The essay, although invented by a great French writer, was very late in making itself at home in France. The so-called Essais of Leibnitz, Nicole, Yves Marie André and so many others were really treatises. Voltaire’s famous Essai sur les mœurs des nations is an elaborate historical disquisition in nearly two hundred chapters. Later, the voluminous essays of Joseph de Maistre and of Lamennais were not essays at all in the literary sense. On the other hand, the admirable Causiers du lundi of Sainte-Beuve (1804–1806) are literary essays in the fulness of the term, and have been the forerunners of a great army of brilliant essay-writing in France. Among those who have specially distinguished themselves as French essayists may be mentioned Théophile Gautier, Paul de Saint-Victor, Anatole France, Jules Lemaître, Ferdinand Brunetière and Émile Faguet. All these are literary critics, and it is in the form of the analysis of manifestations of intellectual energy that the essay has been most successfully illustrated in France. All the countries of Europe, since the middle of the 19th century, have adopted this form of writing; such monographs or reviews, however, are not perfectly identical with the essay as it was conceived by Addison and Lamb. This last, it may be supposed, is a definitely English thing, and this view is confirmed by the fact that in several European languages the word “essayist” has been adopted without modification.

In the above remarks it has been taken for granted that the essay is always in prose. Pope, however, conceived an essay in heroic verse. Of this his Essay on Criticism (1711) and his Essay on Man (1732–1734) are not good examples, for they are really treatises. The so-called Moral Essays (1720–1735), on the contrary, might have been contributed, if in prose, either to the Spectator or the Guardian. The idea of pure essays, in verse, however, did not take any root in English literature. (E. G.)

ESSEG, Esseg or Essek (Hung. Essék; Croatian Osjek), a royal free town, municipality, and capital of the county of Virovitica (Veresce), in Croatia-Slavonia, on the right bank of the Drave, 9 m. W. of its confluence with the Danube, and 185 m. S. of Buda-Pest by rail. Pop. (1890) 24,930; chiefly Magyars and Croats, with a few Germans and Jews. At Esseg the Drave is crossed by two bridges, and below these it is navigable by small steamers. The upper town, with the fortress, is under military authority; the new town and the lower town, which is the headquarters of commerce, are under civil authority. The only buildings of note are the Roman Catholic and Orthodox churches, Franciscan and Capuchin monasteries, synagogue, gymnasium, modern school, hospital, chamber of commerce, and law-courts. Esseg has a thriving trade in grain, fruit, live-stock, plum-brandy and timber. Tannin, silk-weaving and glass-blowing are also carried on.

Esseg owes its origin to its fortress, which existed as early as the time of the Romans under the name of Marsia; though the present structure dates only from 1720. At the beginning of the Hungarian revolution of 1848 the town was held by the Hungarians, but on the 4th of February 1849 it was taken by the Austrians under General Baron Thököly.

ESSEN, a manufacturing town of Germany, in the Prussian Rhine province, 22 m. N.E. from Düsseldorf, on the main line of railway to Berlin, in an undulating and densely populated district. Pop. (1849) 88,113; (1875) 54,790; (1905) 229,270. It lies at the centre of a network of railways giving it access to all the principal towns of the Westphalian iron and coal fields. Its general aspect is gloomy; it possesses few streets of any pretensions, though those in the old part, which are mostly narrow, present, with their grey slate roofs and green shutters, a picturesque appearance. Of its religious edifices (twelve Roman Catholic, one Old Catholic, six Protestant churches, and a synagogue) the minster, dating from the 10th century, with fine pictures, relics and wall frescoes, is alone especially remarkable.

This building is very similar to the Pfalz-Kapelle (capella)
ESSENES

in palatio) at Aix-la-Chapelle. Among the town's principal secular buildings are the new Gothic town-hall, the post office and the railway station. There are several high-grade (classical and modern) schools, technical, mining and commercial schools, a theatre, a permanent art exhibition, and hospitals. Essen also has a beautiful public park in the immediate vicinity. The town originally owed its prosperity to the large iron and coal fields underlying the basin in which it is situated. Chief among its industrial establishments are the famous iron and steel works of Krupp (q.v.), and the whole of Essen may be said to depend for its livelihood upon this firm, which annually expends vast sums in building and supporting churches, schools, clubs, hospitals and philanthropic institutions, and in other ways providing for the welfare of its employees. There are also manufactories of woollen goods and cigars, dyeworks and breweries.

Essen was originally the seat of a Benedictine nunnery, and was formed into a town about the middle of the 10th century by the abbess Hedwig. The abbess of the nunnery, who held from 1275 the rank of a princess of the Empire, was assisted by a chapter of ten princesses and countesses; she governed the town until 1803, when it was secularized and incorporated with Prussia. In 1807 it came into the possession of the grand dukes of Berg, but was transferred to Prussia in 1814.

See Funcke, Geschichte des Fürstenthums und der Stadt Essen (Elberfeld, 1851); Kellen, Die Industriestadt Essen in Wort und Bild (Essen, 1902); and A. Shadwell, Industrial Efficiency (London, 1906).

ESSENES, a monastic order among the Jews prior to Christianity. Their first appearance in history is in the time of Jonathan the Maccabee (161-144 B.C.). How much older they may have been we have no means of determining, but our authorities agree in assigning to them a dateless antiquity. The name occurs in Greek, in the two forms Ἑσσαρνος and Ἑσσαιος. The Ἑσσαρνος is used by Josephus fourteen times, Ἑσσαίοι six, but the latter is the only form used by Philo (ii. 457, 471, 652). Ἑσσαρνος is also used by Synesius and Hippolytus, and its Latin equivalent by Pliny and Solinus; Ἑσσαίοι by Hegesippus and Porphyry. In Epiphanius we find the forms Ὑσσαρνος, Ὑσσαίον, and Ὑσσαίος.

There is a place named Essa mentioned by Josephus (Ant. xiii. 15, § 3), from which the name may have been formed, just as the Christians were originally called Ναγαρνοι orΝαγαρόι, from Nazara. This etymology, however, is not in much favour now. Lightfoot explains the name as meaning "the silent ones," others as meaning "physicians." Perhaps there is most authority in favour of deriving it from the Syriac ṣarān, which in the emphatic state becomes ṣarēn, so that we have a Semitic correspondence to both the Greek forms Ἑσσαρνος and Ἑσσαίος. This etymology makes the word mean "pious." It has also been urged in excuse for Philo's absurd derivation from ὑσσαὶς.

The original accounts we have of them are confined to three authors—Philo, Pliny the Elder, and Josephus. Philo describes them in his treatise known as Quod omnis probus litor (§§ 12, 13; ii. 457-459), and also in his "Apology for the Jews," a fragment of which has been preserved by Eusebius (Præp. Ev. vii. 11, 12). Pliny (N.H. v. 17) has a short but striking sketch of them, derived in all probability from Alexander Polyhistor, who is mentioned among the authorities for the fifth book of his Natural History. This historian, of whom Eusebius had a very high opinion (Præp. Ev. ix. 17, § 1), lived in the time of Sulla. Josephus treats of them at length in his Jewish War (ii. 8), and more briefly in two passages of his Antiquities (xiii. 5, § 9; xviii. 1, § 5). He has also interesting accounts of the prophetic powers possessed by three individual members of the sect—Judas (B.J. i. 3, §§ 5; Ant. xiii. 11, § 2), Menahem (Ant. xv. 10, § 5), and Simon (B.J. ii. 7, §§ 3; Ant. xivii. 13, § 3). Besides this he mentions an Essene Gate in Jerusalem (B.J. v. 4, § 2) and a person called John the Essene. one of the bravest and most capable leaders in the war against the Romans (B.J. ii. 20, § 4; iii. 2, § 1). Josephus himself made trial of the sect of Essenes in his youth; but from his own statement it appears that he must have been a very short time with them, and therefore could not have been initiated into the inner mysteries of the society (De vita sua, 2). After this notices that we have of the Essenes from antiquity are mere reproductions, except in the case of Epiphanius (died A.D. 402), who, however, is so confused a writer as to be of little value. Solinus, who was known as "Pliny's Ape," echoed the words of his master about a century after that writer's death, which took place in A.D. 79. Similarly Hippolytus, who lived in the reign of Commodus (A.D. 180-192), reproduced the account of Josephus, adding a few touches of his own. Porphyry (A.D. 233-306) afterwards did the same, but had the grace to mention Josephus in the context. Eusebius quoted the account as from Porphyry, though he must have known that he had derived it from Josephus (Præp. Ev. ix. 3, §§ 1, 3). But Porphyry's name would impress pagan readers. There is also a mention of the Essenes by Hegesippus (Eus. H.E. iv. 22) and by Synesius in his life of Dio Chrysostom. It has been conjectured that the Clementine literature emanated from Essenes who had turned Christian. (See Esseni.)

The Essenes were an exclusive society, distinguished from the rest of the Jewish nation in Palestine by an organization peculiar to themselves, and by severities of asceticism and a rare benevolence to one another and to mankind in general. These striking characteristics. They had fixed rules for initiation, a succession of strictly separate grades within the limits of the society, and regulations for the conduct of their daily life even in its minutest details. Their membership could be recruited only from the outside world, as marriage and all intercourse with women were absolutely renounced. They were the first society in the world to condemn slavery both in theory and practice; they enforced and practised the most complete community of goods. They chose their own priests and public office-bearers, and even their own judges. Though their prevailing tendency was practical, and the tenets of the society were kept a profound secret, it is perfectly clear from the concurrent testimony of Philo and Josephus that they cultivated a kind of speculation, which not only accounts for their spiritual asceticism, but indicates a great deviation from the normal development of Judaism, and a profound sympathy with Hellenistic philosophy, and probably also with Oriental ideas. At the same time we do our Jewish authorities no injustice in imputing to them the patriotic tendency to idealize the society, and thus offer to their readers something in Jewish life that would bear comparison at least with similar manifestations of Gentile life.

There is some difficulty in determining how far the Essenes separated themselves locally from their fellow-countrymen. Josephus informs us that they had no single city of their own, but that many of them dwelt in every city. While in his treatise Quod omnis, &c., Philo speaks of their avoiding towns and preferring to live in villages, in his "Apology for the Jews" we find them living in many cities, villages, and in great and prosperous towns. In Pliny they are a perennial colony settled on the western shore of the Dead Sea. On the whole, as Philo and Josephus agree in estimating their number at 4000 (Philo, Q.O.P.L. § 12; Jos. Ant. xviii. 1, § 9), we are justified in suspecting some exaggeration as to the many cities, towns and villages where they were said to be found. As agriculture was the favourite occupation, and as their tendency was to withdraw from the haunts and ordinary interests of mankind, we may assume that with the growing confusion and corruption of Jewish society they felt themselves attracted from the mass of the population to the sparsely peopled districts, till they found a congenial settlement and free scope for their peculiar view of life by the shore of the Dead Sea. While their principles were consistent with the neighbourhood of men, they were better adapted to a state of seclusion.

The Essenes did not renounce marriage because they denied the validity of the institution or the necessity of it as providing for the continuance of the human race, but because they had a low opinion of the character of women (Jos. B.J. ii. 8, § 2; Philo, "Apol. for the Jews" in Eus. Præp. Ev. vii. 11, § 8). They adopted children when very young, and brought them up on
their own principles. Pleasure generally they rejected as evil. They despised riches not less than pleasure; neither poverty nor wealth was observable among them; in initiation every one gave his property into the common stock; every member in receipt of wages handed them over to the funds of the society. In matters of dress the asceticism of the society was very pronounced. They regarded oil as a defilement, even washing it off if anointed with it against their will. They did not change their clothes or their shoes till they were torn in pieces or worn completely away. The colour of their garments was always white. Their daily routine was prescribed for them in the strictest manner. Before the rising of the sun they were to speak of nothing profane, but offered to it certain traditional forms of prayer as if beseeching it to rise. Thereafter they went about their daily tasks, working continuously at whatever trade they knew till the fifth hour, when they assembled, and, girding on a garment of linen, bathed in cold water. They next seated themselves quietly in the dining hall, where the baker set bread in order, and the cook brought each a single dish of one kind of food. Before meat and after it grace was said by a priest. After dinner they resumed work till sunset. In the evening they had supper, at which guests of the order joined them, if there happened to be any such, who were wont to appear and disappear to support the tranquility of their intercourse; no one usurped more than his share of the conversation; the stillness of the place oppressed a stranger with a feeling of mysterious awe. This composure of spirit was owing to their perfect temperance in eating and drinking. Not only in the daily routine of the society, but generally, the activity of the members was controlled by their presidents. In only two things could they take the initiative, helpfulness and mercy; the deserving poor and the destitute were to receive instant relief; but no member could give anything to his relatives without consulting the heads of the society. Their office-bearers were elected. They had also their special courts of justice, which were composed of not less than a hundred members, and their decisions, which were arrived at with extreme care, were irrevocable. Oaths were strictly forbidden; their word was stronger than an oath. They were just and temperate in anger, the guardians of good faith, and the ministers of peace, obedient to their elders and to the majority. But the moral characteristics which they most earnestly cultivated and enjoined will best appear in their rules of initiation; as by that time the intending member was tested as to reducibility into the entering the society. If the result was satisfactory, he was admitted, but before partaking of the common meal he was required to swear awful oaths, that he would reverence the deity, do justice to men, hurt no man voluntarily or at the command of another, hate the unjust and assist the just, and that he would render fidelity to all men, but especially to the rulers, seeing that no one rules but of God. He also vowed, if he should bear rule himself, to make no violent use of his power, nor outshine those set under him by superior display, to make it his aim to cherish the truth and unmask liars, to be pure from theft and unjust gain, to conceal nothing from his fellow-members, nor to divulge any of their affairs to other men, even at the risk of death, to transmit their doctrines unaltered, and to keep secret the books of the society and the names of the angels.

Within the limits of the society there were four grades so distinct that if any one touched a member of an inferior grade he required to cleanse himself by bathing in water; members who had been found guilty of serious crimes were expelled from the society, and could not be received again till reduced to the very last extremity of want or sickness. As the result of the ascetic training of the Essenes, and of their temperate diet, it is said that they lived to a great age, and were superior to pain and fear. During the Roman war they cheerfully underwent the most grievous tortures rather than break any of the principles of their faith. In fact, they had in many respects reached the very highest moral elevation attained by the ancient world; they were just, humane, benevolent, and spiritually-minded; the sick and aged were the objects of a special affectionate regard; and they condemned slavery, not only as an injustice, but as an impious violation of the natural brotherhood of men (Philo ii. 437). There were some of the Essenes who permitted marriage, but strictly with a view to the preservation of the race; in other respects they agreed with the main body of the society. It will be apparent that the predominant tendency of the society was practical. Philo tells us expressly that they rejected logic as unnecessary to the acquisition of virtue, and speculation on nature as too lofty for the human intellect. Yet they had views of their own as to God, Providence, the soul, and a future state, which, while they had a practical use, were yet essentially speculative. On the one hand, indeed, they held tenaciously by the traditional Judaism: blasphemy against their lawgiver was punished with death, the sacred books were preserved and read with great reverence, though not without an allegorical interpretation, and the Sabbath was most scrupulously observed. But in many important points their deviation from the strict path of Judaic development was complete. They rejected animal sacrifice as well as marriage; the oil with which priests and kings were anointed they accounted unclean; and the condemnation of oaths and the community of goods were unimpaired by any innovations for which they found no hint or warrant in the Hebrew scriptures. In a word, that which is not an impurity, was their reverence for the sun. In their speculative hints respecting the soul and a future state, we find another important deviation from Judaism, and the explanation of their asceticism. They held that the body is mortal, and its substance transitory; that the soul is immortal, but, coming from the substratum, is lured as by a sorcery of nature into the prison-house of the body. At death it is released from its bonds, as from long slavery, and joyously soars aloft. To the souls of the good there is reserved a life beyond the ocean, and a country oppressed by neither rain, nor snow, nor heat, but refreshed by a gentle west wind blowing continually from the sea (cf. Hom. Od. iv. 566-568), but to the wicked a region of wintry darkness and of unceasing torment. Josephus tells us too that the Essenes believed in fate; but in what sense, and what relation it bore to Divine Providence, does not appear.

The above evidence has left students in doubt as to whether Essenumism is to be regarded as a pure product of the Jewish mind or as due in part to some foreign influence. On the one hand, it might be maintained that the Essenes out-Pharise'd the Pharisees; each of their Pharisees had his distinctive innovation; for Moses and the Law, their Sabbatarianism, their striving after ceremonial purity, and their tendency towards fatalism. But if the Pharisees abstained from good works on the Sabbath, the Essenes abstained even from natural necessities (Jos. B.J. i. 8, § 9); if the Pharisees washed, the Essenes bathed before dinner; if the Pharisees ascribed some things to Fate, the Essenes ascribed all (Jos. Ant. xii. 5, § 9). But on the other hand the Essenes avoided marriage, which the Pharisees held in honour; they offered no animal-sacrifices in the Temple; they refrained from the use of oil, which was customary among the Pharisees (Luke vii. 46); above all they offered prayers to the sun, after the manner denounced in Ezekiel (viii. 16). These and other points of divergences are not explained by Ritsch's interesting theory that Essenumism was an organized attempt to carry out the idea of "a kingdom of priests and an holy nation" (Ex. xix. 6). Granting then that some foreign influence was at work in Essenumism, we have four theories offered to us—that this influence was Persian, Buddhist, Pythagorean, or, lastly, as maintained by Lipsius, that of the surrounding Syrian heathenism. Each of these views has had able advocates, but it must not be supposed that they are mutually exclusive. If we consider how Philo, while remaining a devout Jew in religion, yet managed to assimilate the whole Stoic philosophy, we can well believe that the Essenes might have been influenced, as Zeller maintained that they were, by Neo-Platoism. But as Pythagoras himself came from Samos, and his doctrines have a decidedly Oriental tinge, it may very well be that he and the Essenes drew from a common source; for there is no need to reject, as
is so commonly done, the statements of our authorities as to the antiquity of the Essenes. This common source we may believe with Lightfoot to have been the Persian religion, which we know to have profusely influenced that of Israel, independently of the Essenes.

The fact that the Pharisees and Sadducees so often figure in the pages of the New Testament, while the Essenes are never mentioned, might plausibly be interpreted to show that the New Testament emanated from the side of the Essenes. So far as concerns the Epistle of St James this interpretation would probably be correct. That work contains the doctrine common to the Essenes with Plato, and suggestive of Persian Dualism, that God is the author of good only. There are also certain obvious points of resemblance between the Essenes and the early Christians. Both held property in common; both had scattered communities which received guests one from the other; both avoided a light use of oaths; both taught passive obedience to political authority. The list may be enlarged, but it would not necessarily prove more than that the early Christians shared in the ideas of their age. Christianity was to some extent a popularization of Essenesm, but there is little reason for believing that Jesus himself was an Essene. De Quincey's contention that there were no Essenes but the early Christians is now a literary curiosity.

The original sources of our knowledge of the Essenes have been mentioned at the beginning of this paper; the best modern discussions of the subject may be found in the works of:—Sophie der Grecien, vol. iii Ewald, Geschicht d. V. Israel, iii. 419-428; Reuss, La Théologie chrétienne au siècle apostolique, i. 122-131; Keim, Life of Jesus of Nazareth, vol. i. Lightfoot on the Colossians, Der Essenes in seinem Verhältniss zum Judenhause; Wullenweber, Israelitische und judische Geschichte, Ed. Schürer, The Jewish People in the Time of Jesus Christ, div. ii. vol. ii. § 30. The copious bibliography in Conybeare's edition of Philo's De vita contemplativa bears upon the Essenes as well as upon the Essene literature. For a splendid view of the Essenes see Kohler's article in the Jewish Enzyklopädie. They are there regarded as being simply the rigorists among the Pharisees. But we are also told that the Pharisees characterized the Essenes as 'a fool to destroy the world.'

ESSENTUKI, a watering-place of south Russia, in the government of Terek, 11 m. by rail W. from Pyatigorsk; altitude, 2066 ft. Its alkaline and sulphur-alkaline mineral waters, similar to those of Ems, Selters and Vichy, are much visited in summer. The climate shows great variations in temperature. Pop. (1897) 9074.

ESSEQUIBO, or Essequibo, one of the three settlements of British Guiana, taking its name from the river Essequibo. (See Guiana.)

ESSEX, EARLS OF. The first earl of Essex was probably Geoffrey de Mandeville (q.v.), who became earl about 1139, the earldom being subsequently held by his two sons, Geoffrey and William, until the death of the latter in 1189. In 1169 Geoffrey Fitzpeter or Fitzpiercy (q.v.), who was related to the Mandevilles through his wife Beatrixe, became earl of Essex, and on the death of Geoffrey's son William in 1227 the earldom reverted for the second time to the crown. Then the title to the earldom passed by marriage to the Bohuns, earls of Hereford, and before 1230 Humphrey de Bohun (d. 1275) had been recognized as earl of Essex. With the earldom of Hereford the earldom of Essex became extinct in 1372; afterwards it was held by Thomas of Woodstock, duke of Gloucester, a son of Edward III, and the husband of Eleanor de Bohun; and from Gloucester it passed to the Bourchiers, Henry Bourchier (d. 1483), who secured the earldom in 1461, being one of Gloucester's grandsons. The second and last Bourchier earl was Henry's grandson Henry, who died early in 1540. A few weeks before his execution in 1540 Thomas Cromwell (q.v.) was created earl of Essex; then in 1543 William Parr, afterwards marquess of Northampton, obtained the earldom by right of his wife Anne, daughter of the last Bourchier earl. Northampton lost the earldom when he was attainted in 1553; and afterwards it passed to the famous family of Devereux. Walter Devereux, who was created earl of Essex in 1572, being related to the Bourchiers. Robert, the 3rd and last Devereux earl, died in 1646. In 1661 Arthur Capel was created earl of Essex, and the earldom is still held by his descendants.

ESSEX, ARTHUR CAPEL, 1ST EARL OF (1632-1653), English statesman, son of Arthur, 1st Baron Capel of Hadham (c. 1611), executed in 1649, and of Elizabeth, daughter and heir of Sir Charles Morrison of Cashibury in Hertfordshire, was baptized on the 28th of January 1632. In June 1648, then a sickly boy of sixteen, he was taken by Fairfax's soldiers from Hadham to Colchester, which his father was defending, and carried every day round the works with the hope of inducing Lord Capel to surrender the place. At the restoration he was created Viscount Marden and earl of Essex (20th of April 1661), with special remainder to the male issue of his father, and was made lord-lieutenant of Hertfordshire and a few years later of Wiltshire. He early showed himself antagonistic to the court, to Roman Catholicism, and to the extension of the royal prerogative, and was coupled by Charles II. with Holles as "stiff and sullen men," who would not yield against their convictions to his solicitations. In 1669 he was sent as ambassador to King Christian V. of Denmark, in which capacity he gained credit by refusing to strike his flag to the governor of Kronborg. In 1672 he was made a privy councillor and lord-lieutenant of Ireland. He remained in office till 1677, and his administration was greatly commended by Burnet and Ormonde, the former describing it "as a pattern to all that come after him." He identified himself with Irish interests, and took immense pains to understand the constitution and the political necessities of the country, appointing men of real merit to office, and maintaining an exceptional independence from solicitation and influence. He held a just balance between the Roman Catholics, the English Church and the Presbyterians, protecting the former as far as public opinion in England would permit, and governing the native Irish with firmness and moderation. The purity and patriotism of his administration were in strong contrast to the hopeless corruption prevalent in that at home and naturally aroused bitter opposition, as an obstacle to the unscrupulous employment of Irish revenues for the satisfaction of the court and the king's expenses. In particular he came into conflict with Lord Ranelagh, to whom had been assigned the Irish revenues on condition of his supplying the requirements of the crown, and whose accounts Essex refused to pass. He opposed strongly the lavish gifts of forfeited estates to court favourites and mistresses, prevented the grant of Phoenix Park to the duchess of Cleveland, and refused to encumber the administration by granting reversions. Finally the intrigues of his enemies at home, and Charles's continual demands for money, which Ranelagh undertook to satisfy, brought about his recall in April 1677. He immediately joined the country party and the opposition to Danby's government, and on the latter's fall in 1679 was appointed a commissioner of the treasury, and the same year a member of Sir William Temple's new council. He followed the lead of Halifax, who advocated not the extension of the Royalist, but the limitation of his sovereign powers, and looked to the peace of Orange rather than to Monmouth as the leader of Protestantism, incurring thereby the hostility of Shaftesbury, but at the same time gaining the confidence of Charles. He was appointed by Charles together with Halifax to hear the charges against Lauderdale. In July he wrote a wise and statesmanlike letter to the king, advising him to renounce his project of raising a new company of guards. Together with Halifax he urged Charles to summon the parliament, and after his refusal resigned the treasury in November, the real cause being, according to one account, a demand upon the treasury by the duchess of Cleveland for £25,000, according to another "thenicness of touching French money," "that makes my Lord Essex's squeamish stomach that it can no longer digest his employment."

Subsequently his political attitude underwent a change, the exact cause of which is not clear—probably a growing conviction of the danger incurred by a Roman Catholic sovereign of the English throne. He now, in 1680, joined Shaftesbury's party and supported the Exclusion Bill, and on its rejection by the Lords carried a motion for an association to execute the scheme of expedients proposed by Halifax. On the 23rd of January 1681 at the head of fifteen peers he presented a petition to the king, couched in exaggerated language, requesting the abandonment of the session of parliament at Oxford. He was a jealous prosecutor of the Roman Catholics in the popish plot, and voted for Stafford's attainder, on the other hand interceding for Archbishop Plunket, implicated in the pretended Irish plot.

He, however, refused to follow Shaftesbury in his extreme courses, declined participation in the latter's design to seize the Tower in 1682, and on Shaftesbury's subsequent departure from England became the leader of Monmouth's faction, in which were now included Lord Russell, Algernon Sidney, and Lord Howard of Escrick. Essex took no part in the wilder schemes of the party, but after the discovery of the Rye House Plot in June 1683, and the capture of the leaders, he was arrested at Cashibury and imprisoned in the Tower. His spirits and fortitude appear immediately to have abandoned him, and on the 13th of July he was discovered in his chamber with his throat cut. His death was attributed, quite groundlessly, to Charles and James, and the evidence points clearly if not conclusively to suicide, his motive being possibly to prevent an attainder and preserve his estate for his family. He, was, however, undoubtedly a victim of the Stuart administration, and the antagonism and tragic end of men like Essex, deserving men, naturally devoted to the throne, constitutes a severe indictment of the Stuart rule.

He was a statesman of strong and sincere patriotism, just and unselfish, conscientious and laborious in the fulfilment of public duties, blameless in his official and private life. Evelyn describes him as "a sober, wise, judicious and pondering person, not illeterate beyond the rule of most noblemen in this age, very well versed in English history and affairs, industrious, frugal, methodical and every way accomplished"; and declares he was much deplored, few believing he had ever harboured any seditious designs.1 He married Lady Elizabeth Percy, daughter of Algernon, 10th earl of Northumberland, by whom, besides a daughter, he had an only son Algernon (1670–1710), who succeeded him as 2nd earl of Essex.

BIBLIOGRAPHY—See the Lives in the Dict. of Nat. Biography and in Biographia Britannica (Kippis), with authorities there collected; Essex's Irish correspondence is in the State Collection in the British Museum; his selections have been published in Letters written by Arthur Capel, Earl of Essex (1770) and in the Essex Papers (Cammend Society, 1890), to which can now be added the Calendars of State Papers, Domestic, which contain a large number of his letters and which strongly support the opinion of his contemporaries concerning his unselfish patriotism and industry: see also Somers Tracts (1813), x., and for other pamphlets relating to his death the catalogue of the British Museum.

ESSEX, ROBERT DEVEREUX, 2ND EARL OF (1556–1601), son of the 1st Devereux earl, was born at Netherwood, Herefordshire, on the 19th of November 1556. He entered the university of Cambridge and graduated in 1578. In 1583 he accompanied his stepfather, the earl of Leicester, on an expedition to Holland, and greatly distinguished himself at the battle of Zutphen. He now took his place at court, where so handsome a youth soon found favour with Queen Elizabeth, and in consequence was on bad terms with Raleigh. In 1587 he was appointed master of the horse, and in the following year was made general of the horse and installed knight of the Garter. On the death of Leicester he succeeded him as chief favourite of the queen, a position which injuriously affected his whole subsequent life, and ultimately resulted in his ruin. While Elizabeth was approaching the mature age of sixty, Essex was scarcely twenty-one. Though well aware of the advantages of his position, and somewhat vain of the queen's favour, his constant attendance on her

2 I.e. in the Devereux line.
3 At court was irksome to him beyond all endurance; and when he could not make his escape to the scenes of foreign adventure after which he longed, he varied the monotony of his life at court by intrigues with the maids of honour. He fought a duel with Sir Charles Blount, a rival favourite of the queen, in which the earl was disarmed and slightly wounded in the thigh.

In 1589, without the queen's consent, he joined the expedition of Drake and Sir John Norris against Spain, but in June he was compelled to obey a letter enjoining him at his "utmost peril" to return immediately. In 1590 Essex married the widow of Sir Philip Sidney, but in dread of the queen's anger he kept the marriage secret as long as possible. When it was necessary to avow it, her rage at first knew no bounds, but as the earl did "use it with good temper," and "for her majesty's better satisfaction pleased that my lady should live retired in her mother's house," he soon came to be in very good favour.

In 1591 he was appointed to the command of a force auxiliary to one formerly sent to assist Henry IV. of France against the Spaniards; but after a fruitless campaign he was finally recalled from the command in January 1592. For some years after this most of his time was spent at court, where he held a position of unexampled influence, both on account of the favour of the queen and from his own personal popularity. In 1596 he was, after a great many "changes of humour" on the queen's part, appointed along with Lord Howard of Effingham, Raleigh and Lord Thomas Howard, to the command of an expedition, which was successful in defeating the Spanish fleet, capturing and pillaging Cadiz, and destroying 33 merchant vessels. It would seem to have been shortly after this exploit that the beginnings of a change in the feelings of the queen towards him came into existence. On his return she chided him that he had not followed up his successes, and though she professed great pleasure at again seeing him in safety, and was ultimately satisfied that the abrupt termination of the expedition was contrary to his advice and wishes, she now hated him and was determined to publish anything in justification of his conduct. She doubtless was offended at his growing tendency to assert his independence, and jealous of his increasing popularity with the people; but it is also probable that her strange infatuation regarding her own charms, great as it was, scarcely prevented her from suspecting either that his professed attachment had all along been somewhat alloyed with considerations of personal interest, or that at least it was now beginning to cool. Francis Bacon, at that time his most intimate friend, endeavoured to prevent the threatened rupture by writing him a long letter of advice; and although perseverance in a long course of feigned action was for Essex impossible, he for some time attended pretty closely to the hints of his mentor, so that the queen "used him most graciously." In 1597 he was appointed master of the ordinance, and in the following year he obtained command of an expedition against Spain, known as the Island or Azores Voyage. He gained some trifling successes, but as the Plate adventure was wholly failed of his main purpose; and when on his return the queen met him with the usual reproaches, he retired to his home at Wanstead. This was not what Elizabeth desired, and although she conferred on Lord Howard of Effingham the earldom of Nottingham for services at Cadiz, the main merit of which was justly claimed by Essex, she ultimately held out to the latter the olive branch of peace, and condescended to soothe his wounded honour by creating him earl marshal of England. That, nevertheless, the irritated feelings neither of Essex nor of the queen were completely healed was manifested shortly afterwards in a manner which set propriety completely at defiance. In a discussion on the appointment of a lord deputy to Ireland, Essex, on account of some taunting words of Elizabeth, turned his back upon her with a gesture indicative not only of anger but of contempt, and when she, unable to control her indignation, slapped him on the face, he left her presence swearing such an insult he would not have endured even from Henry VIII.

In 1599, while Ulster was in rebellion under the earl of Tyrone, the office of lieutenant and governor-general of Ireland was conferred on Essex, and a large force put at his command.
ESSEX, EARLS OF—ESSEX, COUNTY OF

His campaign was an unsuccessful one, and by acting in various ways in opposition to the commands of the queen and the council, agreeing with Tyrone on a truce in September, and suddenly leaving the post of duty with the object of privately vindicating himself before the queen, he laid himself open to charges more serious than that of mere incompetency. For these misdemeanours he was brought in June 1600 before a specially constituted court, deprived of all his high offices, and ordered to live a prisoner in his own house during the queen's pleasure. Chiefly through the intercession of Bacon his liberty was shortly afterwards restored to him, but he was ordered not to return to court. For some time he hoped for an improvement in his prospects, but when he was refused the renewal of his patent for sweet wines, hope was succeeded by despair, and half maddened by wounded vanity, he made an attempt (Feb. 7, 1601) to incite a revolution in his behalf, by parading the streets of London with 300 retainers, and shouting, "For the queen! a plot is laid for my life!" These provocations awakened, however, scarcely any other feelings than mild perplexity and wonder; and finding that hope of assistance from the citizens was vain, he returned to Essex House, where after defending himself for a short time he surrendered. After a trial—in which Bacon, who prosecuted, delivered a speech against his quondam friend and benefactor, the bitterness of which was quite unnecessary to secure a conviction entailing at least very severe punishment—he was condemned to death, and notwithstanding many alterations in Elizabeth's mood, the sentence was carried out on the 25th of February 1601.

Essex was in person tall and well proportioned, with a countenance which, though not strict handsome, possessed, on account of its bold, cheerful and amiable expression, a wonderful power of fascination. He was a patron of literature, and himself a poet. His career was not very graceful, but his manners are said to have been "courtly, grave and exceedingly comely." He was a man of iniquous character, unsociable with his equals, but generous to all his dependants and incapable of secret malice; and these virtues, which were innate and which remained with him to the last, must be regarded as somewhat counterbalancing, in our estimation of him, the follies and vices created by temptations which were exceptionally strong.

See Hon. W. B. Devereux, Lives of the Earls of Essex (1853); and Bacon and Essex, by E. A. Abbott (1877). Also the article Bacon, Francis, and authorities there.

ESSEX, ROBERT DEVEREUX, 3rd Earl of (1591–1640), son of the preceding, was born in 1591. He was educated at Eton and at Merton College, Oxford. Shortly after the arrival of James I. in London, Essex (whose title was restored, and the attainder on his father removed, in 1604) was placed about the prince of Wales, as a sharer in both his studies and amusements. At the age of fifteen he was made a page of Franses, Marquis, daughter of the earl of Suffolk, but she was his wife only in name, during his absence abroad (1607–1609) she fell in love with Sir Robert Carr (afterwards earl of Somerset), and on her charging her husband with physical incapacity, the marriage was annulled in 1613. A second marriage which he contracted in 1613 with Elizabeth, daughter of Sir William Pafuel, also ended unhappily. From 1620 to 1623 he served in the wars of the Palatinate, and in 1625 he was vice-admiral of a fleet which made an unsuccessful attempt to capture Cadiz. In 1639 he was lieutenant-general of the army sent by Charles against the Scottish Covenanters; but on account of the irresolution of the king no battle occurred, and the army was disbanded at the end of the year. Essex was discharged "without ordinary ceremony," and refused an office which at that time fell vacant, "all which," says Clarendon, "wrought very much upon his rough, proud nature, and made him susceptible of some impressions afterwards which otherwise would not have found such easy admission." Having taken the side of the parliament against Charles, he was, on the outbreak of the civil war in 1642, appointed to the command of the parliamentary army. At the battle of Edgehill he remained master

of the field, and in 1643 he captured Reading, and relieved Gloucester; but in the campaign of the following year, on account of his hesitation to fight against the king in person, nearly his whole army fell into the hands of Charles. In 1645, on the passing of the self-denying ordinance, providing that no member of parliament should hold a public office, he resigned his commission; but on account of his past services his annuity of £10,000 was continued to him for life. He died on the 14th of September 1646, of a fever brought on by over-exertion in a stag-hunt in Windsor Forest; his line becoming extinct.

ESSEX, WALTER DEVEREUX, 1st Earl of (1541–1576), the eldest son of Sir Richard Devereux, was born in 1541. His grandfather was the 2nd Baron Ferrers, who was created Viscount Hereford in 1550 and by his mother was a nephew of Henry Bourchier, a former earl of Essex. Walter Devereux succeeded as 2nd Viscount Hereford in 1558, and in 1651 or 1652 married Lettice, daughter of Sir Francis Knollys. In 1560 he served as high marshal of the field under the earl of Warwick and Lord Clifton, and materially assisted them in suppressing the northern insurrection. For his zeal in the service of Queen Elizabeth in this and other occasions, he in 1572 received the Garter and was created earl of Essex, the title which formerly belonged to the Bourchier family. Eager to give proof of "his good devotion to employ himself in the service of her majesty," he offered on certain conditions to subdue and colonize, at his own expense, a portion of the Irish province of Ulster, at that time completely under the dominion of the rebel O'Neill's, under Sir Brian MacPhelim and Tirlogh Luineach, with the Scots under their leader Sorley Boy MacDonnell. His offer, with certain modifications, was accepted, and he set sail for Ireland in July 1573, accompanied by a number of earls, knights and gentlemen, and with a force of about 1200 men. The beginning of his enterprise was inauspicious, for on account of a storm which dispersed his fleet and drove some of his vessels as far as Cork and the Isle of Man, his forces did not all reach the place of rendezvous till late in the autumn, and he was compelled to entrench himself at Belfast for the winter. Here, by sickness, famine and desertions, his troops were diminished to little more than 200 men. Intrigues of various sorts, and fighting of a guerrilla type, followed with disappointing results, and Essex had difficulties both with the deputy Fitzwilliam and with the queen. Essex was in estray himself, and his offensive movements in Ulster took the form of raids and border reprisals against the O'Neills; in October 1574 he treacherously captured MacPhelim at a conference in Belfast, and after slaughtering his attendants had him and his wife and brother executed at Dublin. Elizabeth, instigated apparently by Leicester, after encouraging Essex to prepare to attack the Irish chief Tirlogh Luineach, suddenly commanded him to "break off his enterprise"; but, as she left him a certain discretionary power, he took advantage of it to defeat Tirlogh Luineach, chastise Antrim, and massacre several hundreds of Sorley Boy's following, chiefly women and children, discovered hiding in the caves of Rathlin. He returned to England in the end of 1575, resolved "to live henceforth an untroubled life"; but he was ultimately persuaded to accept the offer of the queen to make him earl marshal of Ireland. He arrived in Dublin in September 1576, and three weeks afterwards died of dysentery. There were suspicions that he had been poisoned by Leicester, who shortly after his death married his widow, but these were not confirmed by the post-mortem examination. The endeavours of Essex to better the condition of Ireland were a dismal failure; and the massacres of the O'Neills and of the Scots of Rathlin leave a dark stain on his reputation.

ESSEX, an eastern county of England, bounded N. by Cambridgeshire and Suffolk, E. by the North Sea, S. by the

i.e. in the Devereux line.
dividing it from Kent, W. by the administrative county of London and by Hertfordshire. Its area is 1,542 sq. m. Its configuration is sufficiently indicated by the direction of its rivers. Except that in the N.W. the county includes the heads of a few valleys draining northward to the Cam and so to the Great Ouse, all the streams, which are never of great size, run southward and eastward, either into the Thames, or into the North Sea by way of the broad, shallow estuaries which ramify through the flat coast lands. The highest ground lies consequently in the north-west, between the Cam basin and the rivers of the county. Its principal southward extension is that between the Lea (which with its tributary the Stort forms a great part of the western boundary) and the Roding, and east of the Roding valley. The other chief rivers may be specified according to their estuaries, following the coast northward from Shoeburyness at the Thames mouth. That of the Roach ramifies among several islands of which Foulness is the largest, but its main branch joins the Crouch estuary. Next follows the Blackwater, which receives the Chelmer, the Brain and other streams. Following a coast of numerous creeks and islets, with the large island of Mersea, the Colne estuary is reached. The Colne and Blackwater may be said to form one large estuary, as they enter the sea by a wide estuary in common mouth, 3 m. in width, between Salebridge Forelands and Colne Point. The Lea (Hamford Water) receiving no large stream, W. of the Naze promontory, and then the Stour, bounding the county on the north, joins its estuary to that of the Orwell near the sea. There are several seaside watering-places in favour owing to their proximity to London, of which Southend-on-Sea above the mouth of the Thames, Clacton-on-Sea, Walton-on-the-Naze, and Dovercourt adjoining Harwich are the chief. These and other stations on the estuaries are also in favour with yachtsmen. The sea has at some points seriously encroached upon the land within historic times. The low soft clifs at various points are liable to give way against the waves; in other parts dykes and embankments are necessary to prevent inundation. Inland, that is apart from the flat coast-district, the country is pleasantly undulating and for the most part well wooded. It was formerly, indeed, almost wholly forested, the great Waltham Forest stretching from Colchester to the confines of London. Of this a fragment is preserved in Epping Forest (see EPING) between the Lea and the Roding. On the other side of the Roding Hall Forest has been preserved since 1581. The oak is the principal tree; a noteworthy example was that of Fairlop in Hainault, which measured 45 ft. in girth, but was blown down in 1820.

Geology.—The geological structure of the county is very simple: the greater part is occupied by the London clay with underlyings Reading beds and Thanet sands, with here and there small patches of Bagshot gravels on elevated tracts, as at High Beech, Langdon Hill, Brentwood and Rayleigh; and occasionally the same beds are represented by the large boulder-like Sarsen stones on the lower ground. In the north, the chalk, which underlies the Tertiary strata over the whole county, appears at the surface and forms the downs about Saffron Walden, Birdcrotch and Great Yeldham; it is brought down to the sea by a series of small chines at Dunwich and Walton-on-the-Naze, very important for the fisheries, and at Frinton, where it is quarried on a large scale for lime, cement and whiting. Small patches of Pleistocene Red Crag rest upon the Eocene strata at Beaumont and Oakley, and are very well exposed at Walton-on-the-Naze. Very far towards the coast of the county, it is covered by a superficial deposit of glacial drifts, sands, gravel, and in places boulder clay, as at Epping, Dunmow and Hornchurch where the drift lies beneath the Thames gravel. An interesting feature in the glacial drift is a deep hollow, the Cam valley revealed by borings to be no less than 340 ft. deep at Newport; this ancient valley is filled with drift. In the southern part of the county are broad spreads of gravel and brick earth, formed by the Thames, among which are Saffron Walden, Hornchurch, Ingatestone and Colchester, with their rich deposits of alluvial and alluvial clay. It is again divided into eight parliamentary divisions, and it also includes the parliamentary boroughs of Colchester and West Ham, the latter consisting of two divisions. Each of these returns one member. The county divisions are—Northern or Saffron Walden, North-eastern or Harwich, Eastern or Maldon, Western

Agriculture.—As an agricultural county Essex ranks high. Some four-fifths of the total area is under cultivation, and about one-third of this area is in permanent pasture. Wheat, barley and oats, in that relative order, are the principal grain crops, Essex being one of the chief grain-producing counties. The wheat and barley are in particularly high favour, the wheat of various standard species being exported for seed purposes, while the barley is especially useful in malting. Beans and peas are largely grown, as are vegetables for the London market. Hop-growing was once important. From the comparative dryness of the climate Essex does not excel in pasturage, and winter grazing receives the more attention. The numbers of cattle increase steadily, and store bullocks are introduced in large numbers from Norfolk, Lincolnshire, Ireland and Wales. Of sheep there are but few distinct flocks, and the numbers decrease. Pigs are generally of a high-class Berkshire type.

Other Industries.—The south-west of the county, being contiguous to London, is very densely populated, and is the seat of large and varied industries. For example, there are numbers of chemical works, the extensive engine shops and works of the Great Eastern railway at Stratford, government powder works in the vicinity of Waltham Abbey, and powder stores at Purfleet on the Thames. The extensive water-works for east London, including the Thames Waterworks at Chadwell Heath, serve a large number of water-tanks on the railways. The small docks at Plaistow and Tilbury on the Thames employ many hands. Apart from this industrial district, there are considerable engineering works, especially for agricultural implements, at Chelmsford, Colchester and elsewhere; several silk works, as at Braintree and Halstead; large breweries, as at Brentwood, Chelmsford and Romford; and lime and cement works at Grays Thurrock. The oyster-beds of the Colne produce the famous Colchester natives, and there are similar beds in the Crouch and Roach, for which Burnham-on-Crouch is the centre; and in the Blackwater (Maldon).

Communications.—Railway communications are supplied principally by the Great Eastern railway, of which the main line runs by Stratford, Ilford, Romford, Brentwood, Chelmsford, Witham, Colchester, and Manningtree. The Cambridge and northern line of this company, following the Lea valley, does not touch the county until it diverges along the valley of the Stort. The chief branches are those to Southend and Burnham, Witham to Maldon, Colchester to Brightlingsea, to Clacton and to Walton, and Manningtree to Harwich, on the former; and Witham to Halstead, and Bishop's Stortford. Thence the line to Mark's Tey to Sudbury and beyond, inland; while there are several branch lines among the manufacturing and residential suburbs in the south-west, to Walthamstow and Buckhurst Hill, Chigwell, Loughton, Epping, Ongar, &c. The London, Tilbury & Southend railway, following the Thames, serves the places named, and the Colne Valley railway runs from Chappel junction near Mark's Tey by Halstead to Haverhill.

On the Thames, besides the great docks at Plaistow (Victoria and Albert) and the deep-water docks at Tilbury, the principal calling places for vessels are Grays, Purfleet and Southend, while Barking on the Roding has also shipping trade, and the Lea affords important water-connections. Elsewhere the principal port is Harwich, at the mouth of the Stour, one of the chief ports of England for European passenger traffic. Other towns ranking as lesser estuarine ports are: Brightlingsea and Wivenhoe on the Colne, forming a member of the Cinque Port of Sandwich; Colchester, Maldon on the Blackwater, and Burnham-on-Crouch. The Stour, Chelmer, and Lea and Stort are the principal navigable inland waterways.

Population and Administration.—The area of the ancient county is 986,975 acres, with a population in 1891 of 785,445 and in 1901 of 1,085,771. The area of the administrative county is 979,532 acres. The county contains nineteen hundreds. It is divided into eight parliamentary divisions, and it also includes the parliamentary boroughs of Colchester and West Ham, the latter consisting of two divisions. Each of these returns one member. The county divisions are—Northern or Saffron Walden, North-eastern or Harwich, Eastern or Maldon, Western
or Epping, Mid or Chelmsford, South-eastern, Southern or Roman, South-western or Walthamstow; returning one member each. The municipal boroughs are—Chelmsford (12,580), Colchester (38,773), East Ham (66,018),Harwich (10,970), Maldon (5905), Saffron Walden (8906), Southend-on-Sea (28,837), and one county borough, West Ham (267,158). The following are the other urban districts—Barking Town (21,547), Braintree (3320), Brentwood (4932), Brightlingsea (4501), Buckhurst Hill (4786), Burnham-on-Crouch (2919), Chingford (4393), Clacton (7450), Epping (3780), Frinton-on-Sea (644), Grays Thurrock (13,834), Halstead (6073), Ilford (41,234), Leigh-on-Sea (3667), Leyton (68,912), Loughton (4730), Romford (13,666), Shoebur-ness (4081), Waltham Holy Cross (6540), Walthamstow (95,131), Walton-on-the-Naze (2014), Wanstead (1979), Witham (3454), Wivenhoe (2560), Woodford (13,708). Essex is in the South-eastern circuit, and assizes are held at Chelmsford. The boroughs of Harwich and Southend-on-Sea have separate commissions of the peace, and the boroughs of Colchester, Maldon, Saffron Walden and West Ham have, in addition, separate courts of quarter sessions. The county is ecclesiastically divided into the dioceses of St Albans (with a small portion within that of Ely) and is divided into two archdioceses, containing 459 parishes or districts wholly or in part. There are 399 civil parishes.

There is a military station and depot for recruits at Warley, and a garrison at Tilbury. At Shoeburyness there is a school of gunnery and an extensive ground for testing government artillery of the largest calibre.

**History** (see also below under Essex, Kingdom of).—Essex probably originated as a shire in the time of Ethelstan. According to the Domesday Survey it comprised nineteen hundreds, corresponding very closely in extent and in name with those of the present day. The additional half-hundred of Thureslan on the Suffolk border has disappeared; Wittricesterna is now Dengie; and the liberty of Havering-atte-Bower appears to have been taken out of Bencontree. Essex and Hertfordshire were under one sheriff until the time of Elizabeth. At the time of the Survey Count Eustace held a vast fief in Essex, and the court of the Honour of Boulogne was held at Witham. Benty Heath in Dagenham, Hundred Heath in Tendring and Castle Hedingham in Hinckford were the meeting-places of their respective hundreds. The stewardship of the forest of Essex was held by the earls of Oxford until deprived of it for adherence to the Lancastrian cause. In 1421 certain parts of Essex inherited by Henry V. from his mother were brought under the jurisdiction of the duchy of Lancaster.

Essex was part of the see of London from the time of the foundation of the bishopric in the 7th century. The archdeaconries are first mentioned in 1108; that of Essex extended over the south of the county and in 1291 included eight deaneries; the north of the county was divided between the archdeaconries of Middlesex and Colchester, comprising three and six deaneries respectively. Colchester was constituted a suffragan bishopric by Henry VIII. In 1836 Essex was transferred to the diocese of Rochester, with the exception of nine parishes which remained in London. In 1845 the archdeacon of Middlesex ceased to exercise control in Essex, and the deaneries were re-adjusted. In 1875 Essex was transferred to the newly created diocese of St Albans, and in 1877 the archdeaconry of Essex was subdivided into twelve deaneries, that of Colchester into sixteen.

Owing to its proximity to the capital Essex is intimately associated with all the great historical struggles. The nobility of Essex took a leading part in the struggle for the charter, and of the twenty-four guardians of the charter, four were Essex barons. The castles of Pleshey, Colchester, and Hedingham were held against the king in the Barons' War of the reign of Henry III., and 5000 Essex men joined the peasant rising of 1381. During the Wars of the Roses the Lancastrian cause was supported by the de Veres, while the Bourchiers and Lord Fitz-Walter were among the Yorkist leaders. Several Essex men were concerned in the Gunpowder Plot, and in the Civil War of the 17th century the county rendered valuable aid to the parliament.

After the Conquest no Englishman retained estates in Essex of any importance, and the chief lay barons at the time of the Survey were Geoffrey de Mandeville and Aubrey de Vere. The de Veres, earls of Oxford, were continuously connected with the county until the extinction of the title two centuries ago. Pleshey was the stronghold of the Mandevilles, and, although the house became extinct in 1189, its descendants in the female line retained the title of earls of Essex. The Honour of Hattfield Peverel held by Ranulf Peverel after the Conquest escheated to the crown in the reign of Henry I., and in the same reign the fief of Robert Gerton passed to the house of Montfichet.

Essex has always been mainly an agricultural county, and the ordinary agricultural pursuits were carried on at the time of the Domesday Survey, which also mentions salt-making, wine-making, bee-culture and cheese-making, while the oyster fisheries have been famous from the earliest historic times. The woolen industry dates back to Saxon times, and for many centuries ranked as the most important industry. Cloth-weaving was introduced in the 14th century, and in the 16th century Colchester was noted for its "bays and says." Colchester also possessed a valuable leather industry in the 16th century, at which period Essex was considered an exceptionally wealthy and prosperous county; Norden, writing in 1594, describes it as "moste fett, frutefull, and full of all proffitable things."

The decline of the cloth industry in the 17th century caused great distress, but a number of smaller industries began to take its place. Saffron-culture and silk-weaving were extensively carried on in the 17th century, and the 18th century saw the introduction of the straw-plait industry, potash-making, calico-printing, malting and brewing, and the manufacture of Roman cement.

The county returned four members to parliament in 1290. From 1295 it returned two members for the county and two for Colchester. Maldon acquired representation in 1335 and Harwich in 1604. Under the Reform Act of 1832 the county returned four members in four divisions. Under the Representation of the People Act of 1868 Maldon and Harwich each lost one member, and the county returned six members in three divisions.

**Antiquities.**—It is supposed by many antiquaries that Saxon material can be detected in the foundations of several of the Essex churches, but, with the exception of Ashingdon church tower, believed to have been erected by Canute after his victory over Edmund Ironside, there is no obviously recognizable building belonging to that period. This is probably to be in part ascribed to the fact that the comparative scarcity of stone and the unusual abundance of timber led to the extensive employment of the latter material. Several of the Essex churches, as Blackmore, Mountnessing, Margaretting, and South Benfleet, have massive porches and towers of timber; and St Andrew's church, Greenstead, with its walls of solid oak, continues an almost unique example of its kind. Of the four round churches in England one is in Essex at Little Maplestead; it is both the smallest and the latest. The churches of South Weald, Hadleigh, Blackmore, Heybridge and Hadstock may be mentioned as containing Norman work; with the church of Castle Hedingham for its fine Transitional work; Southchurch, Danbury and Boreham as being partly Early English; Ingatestone, Stebbing and Tilty for their Decorated architecture; and Messing, Thaxted, Saffron Walden, and the church of St Peter ad Vincula at the small town of Coggeshall, near Colchester, for specimens of Perpendicular. Stained glass windows have left their traces in several of the churches, the finest remains being those of Margaretting, which represent a tree of Jesse and the daisy or herb Margaret. Paintings have evidently been largely used for internal decoration: a remarkable series, probably of the 12th century, but much restored in the 14th, exists in the chancel of Copford church; and in the church at Ingatestone there was discovered in 1868 an almost unique fresco representation of the seven deadly sins. The oldest brasses preserved in the county are those of Sir William Fitz-Ralph at Pembrash, about 1423; Richard of Beltown, at Corringham, 1340; Sir John Gifford, at Bowers...
ESSEX, KINGDOM OF—ESSLINGEN

Gifford, 1348; Ralph de Kneyton, at Avel, 1370; Robert de Swynbourn, at Little Horkesley, 1307; and Sir Ingelram de Brugge, at South Ockendon, 1400. The brass of Thomas Heron, aged 14, at Little Ilford, though dating only from 1517, is of interest as a picture of a schoolboy of the period. Ancient wooden effigies are preserved at Danbury, Little Leighs and Little Horkesley.

Essex was rich in monastic foundations, though the greater number have left but meagre ruins behind. The Benedictines had an abbey at Saffron Walden, nunneries at Barking and Wickes, and priories at Earl's or Monk's Colne and Castle Hedingham; the Augustinian canons had an abbey at Waltham (see Waltham Abbey; the portion remaining shows Norman work of the finest character), priories at Thoby, Blackmore, Bicknacre, Little Leighs, Little Dunmow and St Oysth (see BRIGHTLINGSEA); there were Cistercian abbeys at Coggeshall, Stratford and Tilty; the Cluniac monks were settled at Prittlewell, the Premonstratensians at Beleagh Abbey, and the Knights Hospitallers at Little Maplestead. Barking Abbey is said to date its first origin from the 7th century; most of the others arose in the 12th and 13th centuries. Besides the keep at Colchester there is a fine Norman castle at Castle Hedingham, and, two dilapidated round towers still stand at Beleagh Abbey, South Ockendon, Offley, and Plestow, the subject of the earls of Essex, have left only mounds. Hawering-atte-Bower, the palace that was occupied by many queens, is replaced by a modern house; Wickham, the mansion of the bishops of London, no longer stands. New Hall, which was successively occupied by Henry VIII, Elizabeth, the earl of Essex, George Villiers, duke of Buckingham, and Cromwell, is now a nunnery of the order of the Holy Sepulchre. Audley End, the mansion of Lord Braybrooke, is a noble example of the domestic architecture of the Jacobean period; Layer Marney is an interesting proof of the Italian influences that were at work in the time of Wolsey. Horeham Hall was built by Sir John Cutt in the reign of Henry VII, and Gosfield Hall is of about the same date.

See Norden, Speculi Britannia Pars: an Hist. and Geogr. Descrip. of the County of Essex (1594) (edited for the Camden Society by Sir Henry Ellis, 1840, from the original MS. in the Marquis of Salisbury’s library at Hatfield); Nicholas Tindal, Hist. of Essex (1720); N. Salmon, The Hist. and Antiq. of Essex (London, 1740)—based on the collections of James Strangman of Hadleigh (v. Trans. of Essex Arch. Soc. vol. ii.). P. An account of various MS. collections connected with the county is given by H. W. King in vol. ii. of the Transactions (1863).

ESSEX, KINGDOM OF, one of the kingdoms into which Anglo-Saxon Britain was divided, properly the land of the East Saxons. Of its origin and early history we have no record except the bare statement of Bede that its settlers were of the Old Saxon race. In connexion with this it is interesting to notice that the East Saxons dynasty claimed descent from Seaxneat, not Woden. The form Seaxneat is identical with Saxnot, one of three gods mentioned in a short continental document probably of Old Saxon origin. Bede does not mention this kingdom in his narrative until 604, the year of the consecration of Mellitus to the see of London. The boundaries of Essex were in later times the rivers Stour and Thames, but the original limits of the kingdom and its extent have been variously stated; towards the north it may not the whole of Hertfordshire, and in the 7th century the whole of Middlesex. In 604 we find Essex in close dependence upon Kent, being ruled by Saberth, sister's son of Æthelberht, under whom the East Saxons received Christianity. The three sons of Saberth, however, expelled Mellitus from his see, and even after their death in battle against the West Saxons, Eadwald of Kent was unable to restore him. In the year 653 we find Northumbrian influence paramount in Essex, for King Sigeberht at the instance of Osio became a Christian and received Cedd, the brother of St Chad, in his kingdom as bishop, Tilbury and Vindonæcera (on the Blackwater), being the chief scenes of his work. Swithelm, the successor of Sigeberht, was on terms of friendship with the East Anglian royal house, King Æthelwald being his sponsor at his baptism by Cedd. It was probably about this time that Erconwald, afterwards bishop of London, founded the monastery of Barking. Swithelm's successors Sigehere and Sebbe were dependent on Wulfhere, the powerful king of Mercia, who on the apostasy of Sigehere sent Bishop Jaruman to restore the faith. There are grounds for believing that an East Saxon conquest of Kent took place in this reign. A forged grant of Ceadwalla speaks of the fall of Kent before Sigehere as a well-known event; and in a Kentish charter dated 676 a king of Kent called Swibrhard grants land with the consent of his father King Sebbe. In 692 or 694 Sebbe abdicated and received the monastic vows from Walhede, the successor of Erconwald at London. His sons Sigeheard and Swithed succeeded him as kings of Essex, Sigehere being apparently dead. As the laws of Æthelbald of Mercia is found granting privileges at the port of London, and perhaps the western portion of the kingdom had already been annexed, for henceforward London is frequently the meeting-place of the Mercian council. The violent death of Srlred, king of Essex, is mentioned in the Saxon Chronicle under the year 746; but we have no more information of historical importance until the defeat of the Mercian king Beornwulf in 825, when Essex, together with Kent, Sussex and Surrey, passed into the hands of Egbert, king of Wessex. After 825 we hear of no more kings of Essex, but occasionally of earls. About the year 870 Essex passed into the hands of the Danes and was left to them by the treaty between Alfred and Guthrum. It was reconquered by Edward the Elder. The earldom in the 10th century apparently included several other counties, and its most famous holder was the ealdorman Britnoth, who fell at the battle of Maldon in 991.

The following is a list of kings of Essex of whom there is record: Saberth (c. d. 617), son of Saberth, including probably Saward and 'Seaxed'; Sigeberht (Parvus, Sigeberht II); Swithhelm (d. c. 664); Sigeheard (reigned perhaps 664-670); Sebbe, son of Seaxed (664-664); Seheard (reigned in 693-694); Swefred (reigning in 693-694 and in 704); the last two being sons of Sebbe; Swebriht (d. 738); Srlred (d. 746); Switherd, grandson of Sigeheard (suc. 745); Sigeric; son of Srlred (abd. 798); Sigered, son of Sigeric (reigning in 823).

ESSLINGEN, a town of Germany, in the kingdom of Württemberg, in a fertile district on the Neckar, 9 m. S.E. from Stuttgart, on the railway to Ulm. Pop. (1905) 20,750. It is surrounded by medieval walls with towers and bastions, and has thirteen suburbs, one lying on an island in the river. On a commanding height above the town lies the old citadel. The inner town has an old (1430) and a new Rathaus, the latter, formerly a palace, an exceedingly handsome edifice. The church of Our Lady (Frauenkirche) is a fine Gothic building of the 15th century, and has a beautifully sculptured doorway and a lattice spire 240 ft. high. The church of St Dionysius dated from the 13th century, and possesses a fine screen and a ciborium of 1486. Esslingen possesses several schools, a theatre and a rich endowed hospital, while its municipal archives contain much valuable literature bearing especially on the period of the Reformation. The town
has railway, machine and electrical works; cloth, gloves and buttons are also manufactured here, and there are spinning-mills. There is a large lithographic establishment, and a considerable trade is done in wine and fruit, the wines of Esslingen being very famous.

Esslingen, which dates from the 8th century, became a town in 886. It was soon a place of importance; it became a free imperial city in 1209 and was surrounded with walls by order of the emperor Frederick II. Its liberty was frequently threatened by the rulers of Württemberg, but it did not become part of that country until 1802.

See K. H. S. Pfaff, Geschichte der Reichsstadt Esslingen (Esslingen, 1852); and Ströhmfield, Esslingen in Wort und Bild (Esslingen, 1902).

ESTABLISHMENT (O. Fr. establissement, Fr. établissement, late Norm. Fr. establishment, from O. Fr. establir, Fr. établir, Lat. stabile, to make stable), generally the act of establishing or fact of being established, and so by transference a thing established. Thus we may speak of the establishment (i.e. setting up) of a business, the "long establishment" of a business, and of the manager of the establishment. In a special sense the word is applied, with something of the three above-mentioned connotations, to certain religious bodies in their relation to the state. It is with this latter that the present article is concerned.

Perhaps the best definition which can be given, and which will cover all cases, is that establishment implies the existence of some definite and distinctive relation between the state and a religious society (or conceivably more than one) other than that which is shared in by other societies of the same general character. Of course, a certain relationship must needs exist between the state and every society, religious or secular, by virtue of the sovereignty of the state over each and all of its members. Every society must possess certain principles or perform certain acts, and the state may make the profession of such principles unlawful, or impose a penalty upon the performance of such acts; and, moreover, every society is liable before the law as to the fulfilment of its obligations towards its members and the due administration of its property should it possess any. With all this establishment has nothing to do. It is not concerned with what the religious society qua society, or with what is common to all religious societies, but with what is exceptional. It denotes any special connexion with the state, or privileges and responsibilities before the law, possessed by one religious society to the exclusion of others; in a word, establishment is of the nature of a monopoly. And it does not imply merely privilege. The state and the Church have mutual obligations towards one another: each is, to some extent, tied by the existence of this relationship, and each accepts the limitations for the sake of the advantages which accrue to itself. The state does so in view of what it believes to be the good of all its members; for "the true end for which religion is established is not to provide for the true faith, but for civil utility" (Warburton), even if the latter be held to be implied in the former. On the other hand, the Church accepts these relations for the facilities which they involve, i.e. for its own benefit. It will be seen that this definition excludes, and rightly, many current presuppositions. Establishment affirms the fact, but does not determine the precise nature, of the connexion between the state and the religious society. It does not tell us, for example, when or how it began, whether it is the result of an unconscious growth (as with the Gallican Church previous to the French Revolution), or of a determinate legislative act (as with the same Church re-established by the Concordat of 1801). It does not tell us whether an endowment of the religious society by the state is included; what particular privileges are enjoyed by the religious society; and what limitations are placed upon the free exercise of its life. These things can only be ascertained by actual inquiry; for the conditions are precisely similar in no two cases.

To proceed to details. At the present day there is no established religion in the United States, the German empire as a whole, Holland, Belgium, France and Austria-Hungary (saving, indeed, "the rights of the sovereign arising from ecclesiastical dignity" 1); whereas there are religious establishments in Russia, Greece, Sweden, Norway, Denmark, Prussia, 2 Spain, Portugal and even in Italy, as well as in England and Scotland. These, however, differ greatly amongst themselves. In Russia the "Orthodox Catholic Eastern" is the state religion. The emperor is, by the fundamental laws of the empire, "the sovereign defender and protector of the dogmas of the dominant faith, who maintains orthodoxy and holy discipline within the Church," although, of course, he cannot modify either its dogmas or its outward order. Further, "the autocratic (i.e. imperial) powers acts in the ecclesiastical administration by means of the Most Holy Ruling Synod, created by it" 3; and all the officers of the Church are appointed by it. The enactments of the Synod do not become law till they have received the emperor's sanction, and are then published, not in its name but in his; and a large part of the revenues of the Church is derived from state subsidies. In Greece the "dominant religion ("Πρωτοκατάρα Θρησκεία") is that of the Eastern Orthodox Church of Christ" 4; and although toleration is otherwise complete, no proselytism from the Church is allowed. The king swears to protect it, but no powers pertain to him with regard to it such as those which the tsar enjoys; the present king is not a member of it, but his successors must be. In Sweden, Lutheranism was adopted as the state religion by the synod of Upsala (Upsala mäle) in 1593, and the king must profess it. The "Lutheran Protestant Church" retains an episcopal order, and is supported out of its own revenues. Archbishops and bishops are chosen by the king out of those names submitted to him, and he also nominates to royal peculiarities. The ecclesiastical law (Kyrkolag), first constituted in 1686, is part of the law of the state, but may not be modified or abolished without consent of a General Synod; and although ad interim interpretations of that law may be given by the king on the advice of the Supreme Court, since 1866 these have been subject to review and rejection by the next General Synod. In Norway the "Evangelical-Lutheran" is the "official religion," but the Church is supported by the state, its property having been secularized. It is also governed by the king, who by the constitution is to "regulate all that concerns divine service and the clergy," and to see that the prescribed order is carried out. It is much the same in Denmark, where, however, the "Evangelical-Lutheran Church" has since the fundamental constitutional law of the 5th of June 1849 been officially described as the National Church (FolkKirke) instead of the State Church (Statskirke) as formerly, and the constitution provides for its regulation by further legislation, which has not yet been passed. For Prussia, see under that heading; it need only be added that self-government still tends to increase, but that the emperor William II. has exercised his office as summus episcopus more freely than most of his predecessors. In Spain the "Catholic, Apostolic and Roman religion is that of the state, "the nation binds itself to maintain its worship and its ministers," and the rites of any other religion are only permitted in private. The patriarch of the Indies and the "archbishops are senators by right, and the king may nominate others from amongst the bishops; only laymen may sit in the church of denominations above approved, and their property confiscated. In 1835 and 1836; in 1830 the religious and ecclesiastical property was exchanged for untransferrable government securities and the support of the clergy of the State Church is assured by an unrepealed law previous to the present constitution. In Portugal it is much the same, but all the home bishops

1In effect this involves the establishment of all religious denominations, for none can exist without the express authorization of the state, and all are subject to more or less interference on its part. This is the case in all the European countries, but technically "bishop" of the Evangelical Church, the constitution of which was fixed by an imperial patent in 1866 and modified by another in 1891 (see Herzog-Hauck, Realencycl. ed. 1904. s. v. "Osterreich"). 2Also in the other German Protestant states. The relations of the Roman Catholic Church with the various governments are settled by separate concordats with the papacy (see Concordat).
sit in the upper chamber as peers (Pares do Reino) by right, and there is no restriction on membership of the chamber of deputies. A more important point is that the king confers all ecclesiastical benefices and nominates the bishops, instead of their being chosen, as in Spain, by agreement between the civil power and the papacy. In Italy, in spite of the feud between the papacy and the civil power, the fact remains that, by the Statuto fondamentale, "the Catholic, Apostolic and Roman religion is the sole religion of the state," and the king may nominate "archbishops and bishops of the state" to be senators. The Legge sulle prerogative del Summo Pontifice, &c., or "Law of Guarantees," by which the papal prerogatives are secured, has been declared by the Council of State to be a fundamental law; and while many civil restrictions upon the activities of the Church are removed by it, outside Rome and the suburbanicar dioceses the royal exequatur is still required before a bishop is installed. Moreover, the bulk of Church property having been secularized, the Italian clergy receive a stipend from the state.

Establishment is, of course, a distinctively English term, but it implies precisely the same thing as "Staatsreligion" or "exträle dominantie" does elsewhere, neither more nor less. It denotes the existence of a special relationship between Church and state without defining its precise nature. The statement that the Church of England or the Scottish Kirk is "established by law" denotes that it has a peculiar status before the law; but that is all. (a) There is no basis whatever for the once popular assumption that the word "established" as applied to the Church means "created," or the like; on the contrary, the modern use of the word in this sense is a misleading perversion. To establish is to make firm or stable; and a thing cannot be established unless it is in existence. A few examples will make it clear that this is the true sense of the word, and that in which it is used here.

"Stablish the thing, O God, that thou hast wrought in us" (Ps. lxviii. 28, P.B.); A.V. and R.V. "strengthens" implies that the thing is already wrought; it could not be "established" else. "Stablish your hearts" (Jas. v. 8) implies that the hearts are already in existence. "Until he had her settled in her raine With safe assurance and establishment" (Faerie Queene, v. xi. 33) would have been impossible unless the reign had already begun. This is the meaning of the words in many Tudor acts of parliament, "be it enacted, ordained and established," or the like (21 Hen. VIII. c. 1; 27 Hen. VIII. c. 28, s. 9; 28 Hen. VIII. c. 13 [Ireland]; 28 Hen. VIII. c. 18 [Ireland]; 33 Hen. VIII. c. 27; 1 Eliz. c. 1, ss. 15, 17; 1 Eliz. c. 4, s. 4); that which is then and there enacted is to be valid for the future.

(b) Nor is it necessarily implied that establishment is a process completed once for all. Every law touching the Church slightly alters its conditions; everything that affects the relations of Church and state may be regarded as a measure of establishment or the reverse. When the two Houses of Parliament, in an address to William III. after his coronation, spoke of their proposed measures of toleration, the king said in his reply, "I do hope that the ease which you design to Dissenters will contribute very much to the establishment of the Church" (Cobbett, Parl. Hist. vi. 218). And Defoe (in 1722) published an ironical tract with the title, The Shortest Way with the Dissenters, or Proposals for the Establishment of the Church. (c) Nor is it necessarily implied that there was any specific time at which establishment took place. Such may indeed be the case, as with the Kirk in Scotland; but it certainly cannot be said that the English Church was established at any particular time, or by any particular legislative act. There were, no doubt, periods when the existing relations between Church and state were modified or re-defined, notably in the 16th and 17th centuries; but the relations themselves are far older. They existed from the very first: the English Church and state grew up side by side, and from the beginning they were in close relations with one another. But although the state of things which it represented was there from the first, the term "established" or "established by law" only came into use at a later date. Until there was some other religious society to be compared with it such a distinctive epithet would have had no point. As, however, there arose religious societies which had no status before the law, it became more usual, and yet more so when the formulae of the Church came to be "established" by civil sanctions (the Books of Common Prayer by 5 and 6 Edw. VI. c. 1, s. 4, &c.; the Articles by 13 Eliz. c. 12; the new Ordinal by 13 and 14 Car. II. c. 4, title). Accordingly the Church itself came to be spoken of as established by law; first, it would seem, in the Canons of 1604, and subsequently in many statutes (Act of Settlement, 6 Anne, c. 8 and c. 11, &c.). In all such cases the Church is described as already established, not as being established by the particular canon or statute. In other words, the constitutional status of the Church is affirmed, but nothing is said as to how it arose.

The legislative changes of the 16th and 17th centuries brought "establishment" into greater prominence and greatly modified its conditions, but a moment's thought will show that it did not begin then. If, e.g., all post-Reformation ecclesiastical statutes were non-existent, the relations between Church and state would be very different, but there would still be an "establishment." The Church would sit with the House of Lords, the clergy would tax themselves in convolution, the Church courts would possess coercive jurisdiction, and so on. The present relations of Church and state in England may be briefly summed up as follows:

(1) The personal relation of the crown to the Church, including (a) restraints upon the action of convocation (formulated by 25 Hen. VIII. c. 19); (b) nomination of bishops, &c. (25 Hen. VIII. c. 20); (c) power of supervision as visitor, long disputed (26 Hen. VIII. c. 1; 1 Eliz. c. 1, s. 17); (d) power of receiving appeals as the fount of civil justice (25 Hen. VIII. c. 19, &c.). In connexion with these, it must be borne in mind that (a) the holder of the crown receives coronation from the church and takes an oath having reference to it (1 Will. III. c. 6), and (b) the crown is held on the condition of communion with the Church of England (Act of Settlement); the conditions of communion are laid down in the Prayr Book, which itself is sanctioned by law.

(2) The relation of the Church to the crown in parliament. No change has been permitted in its doctrine or formularies without the sanction of an act of parliament. (3) Privileges of the Church and clergy. Of these may be mentioned (a) the coercive jurisdiction of the Church courts; (b) the right of bishops to sit in the House of Lords. It need hardly be said that establishment in England does not include an endowment of the Church by the state. Nothing of the kind ever took place on any large scale, and the grants for Church purposes in the 18th century are comparable with the regium donum to Nonconformists.

The position of the Church of Ireland until its disestablishment (see below) was not dissimilar. With Scotland the case is different. The establishment of the Kirk was an entirely new process, carried out by a more or less definite series of legislative and administrative acts. The Convention of Estates which met at Edinburgh in 1560 ordered the drawing up of a new Confession of Faith, which was done in four days by a committee of preachers, and on the 24th of August it passed three acts, one abolishing the pope's authority and all jurisdiction of Catholic prelates, another repealing the old statutes in favour of the Old Church, the third authorizing the celebration of the Eucharist in an ordinary way, with no penalty. The intention was to make a clean sweep of the Old Church, which was denounced as "the Kirk Malignant." The new model thus set up was confirmed by the Scottish act of 1567, c. 6, which declared it to be "the onely true and halie Kirk of Jesus Christ within this realme." Again, after the revolution of 1688 had put an end to the attempts of the Stuart kings to impose the episcopal model on Scotland, by the act of 1690, c. 5, the crown and estates "ratifie and establish the Confession of Faith, . . . as also they do estabhish, ratifie and confirm the Presbyterian government and

1 Andrew Lang, Hist. of Scotland, ii. p. 75 ff. Compare with this the position of the reformers generally in England, where even so stout a Puritan as William Harrison (Description of England, 1579) does not dream of separating the organic life of the Church of England from that of the pre-Reformation Church. (Ed.)
discipline." The "Act of Security" of 1705, as incorporated in the Act of Union 1706, speaking of it "as now by law established," says that "Her Majesty... doth hereby establish and confirm" it, and finally declares this act, "with the Establishment therein contained," to be "a fundamental and essential condition of the Union." Nevertheless, the conditions of establishment in the Scottish Kirk are much easier than those of the Church of England. It is bound by the statutes sanctioning its doctrine and order, but within these limits its legislative and judicial freedom is unimpaired. A royal commissioner is present at the meetings of the general assembly, but he need not be a member of the Kirk; and there is no constitutional tie between the crown and the Kirk such as there is in England. There is what may accurately be described as a state endowment, the bulk of the property of the Old Church having been conferred upon the Scottish Kirk.

Not unnaturally the organization of Anglican Churches in the colonies was followed in some cases by their establishment, which included endowment. It was so, for example, in the East and West Indies; and the disestablishment of the West Indian Church in 1868 was followed, in 1873, by a re-establishment of the Church in Barbados by the colonial legislature. India is the only other part of the empire (outside Great Britain) in which there is to-day a religious establishment.

Disestablishment is in theory the annulling of establishment; but since an established Church is usually rich, disestablishment generally includes disendowment, even where there is no state endowment of religion. It is, in short, the abrogation of establishment, coupled with such a confiscation of Church property as the state thinks good in the interests of the community. The disestablishment of the West Indian Church in 1868 has already been referred to; in 1869 the Irish Church disestablishment Bill was passed. Private bills relating to Scotland have more than once been brought forward. In 1672, in the Lords, government introduced a suspensive Bill, intended as the preliminary step towards disestablishing and disendowing the Church in Wales; it was withdrawn, however, in the same session, and the question of Welsh disestablishment slumbered until in 1906 a royal commission was appointed by the Liberal government to inquire into the subject, and in 1909 a Bill was introduced on much the same lines as in 1895.

The case of the Irish Church will illustrate the process of disestablishment, although, of course, the precise details would vary in other cases. The Irish Church Act was passed in 1869 by Gladstone's first government, after considerable opposition, and provided that from January 1, 1871, the union created by statute between the Churches of England and Ireland should be dissolved, and the Church of Ireland should "cease to be established by law." Existing ecclesiastical corporations were dissolved, and their rights ceased, compensation being given to all individuals and their personal properties being secured for life. All rights of patronage, including those of the crown, were abolished, with compensation in the case of private patrons; and the archbishops and bishops ceased to have the right of summons to the House of Lords. All laws restraining the freedom of action of the Church were repealed; the ecclesiastical law, however, to subsist by way of contract amongst the members of the Church (until altered by a representative body). Provision was made for the incorporation by charter of the representative body of the Church, should such a body be found, with power to hold landed property. All existing ecclesiastical property was vested in a commission, which was to give compensation for life interests, to transfer to the new representative body the churches, glebe houses, and £500,000 in compensation for endowments by private persons since 1660, and to hold the rest for such purposes as parliament might thereafter determine.

ESTABLISHMENT OF A PORT—ESTATE

ESTABLISHMENT OF A PORT, the technical expression for the time that elapses between the moon's transit across the meridian at new or full moon at a given place and the time of high water at that place. The interval (constant at any one place) may vary from 6 mins. (Harwich) to 11 hrs. 45 mins. (North Foreland). At London Bridge it is 1 hr. 58 mins. (See also Tide.)

ESTAIG, CHARLES HECTOR, COMTE d' (1720-1794). French admiral, was born at the chateau of Ruel, Auvergne, in 1720. He entered the army as a colonel of infantry, and in 1757 he accompanied count de Lally to the East Indies, with the rank of brigadier-general. In 1770 he was made prisoner at the siege of Madras, but was released on parole. Before the ratification of his exchange he obtained command of some vessels, and conducted various naval attacks against the English; and having returned to France in 1780, fallen accidentally into their hands, he was one of the prisoners whom the English turned over to the French, paroled, thrown into prison at Portsmouth, but as the charge could not be properly substantiated he was soon afterwards released. In 1783 he was named lieutenant-general in the navy, and in 1777 vice-admiral; and in 1788 he obtained the command of a fleet intended to assist the United States against Great Britain. He sailed on the 13th of April, and between the 11th and the 22nd of July, blockaded Howe at Sandy Hook, but did not venture to attack him, though greatly superior in force. In concert with the American generals, he planned an attack on Newport, preparatory to which he compelled the British to destroy some war vessels that were in the harbour; but before the concerted attack could take place, he put to sea against the English fleet, under Lord Howe, when owing to a violent storm, which arose suddenly and compelled the two fleets to separate before engaging in battle, many of his vessels were so shattered that he found it necessary to return to Boston harbour. He then sailed for the West Indies on the 4th of November. After a successful attack Santa Lucia from Admiral Barrington, he captured St Vincent and Grenada. On the 6th of July 1779 he fought a drawn battle with Admiral John Byron, who retired to St Christopher. Though superior in force, D'Estaing would not attack the English in the roadstead, but set sail to attack Savannah. All his attempts, as well as those of the Americans, against the town were repulsed with heavy loss; and he was finally compelled to retire. He returned to France in 1780. He was in command of the combined fleet before Cadiz when the peace was signed in 1783; but from that time his chief attention was devoted to politics. In 1787 he was elected to the assembly of the notables; in 1789 he was appointed commandant of the national guard; and in 1792 he was chosen admiral by the National Assembly. Though in favour of national reform he continued to cherish a strong feeling of loyalty to the royal family, and on the trial of Marie Antoinette in 1793 bore testimony to her favour. On this account, and because of certain friendly letters which had passed between him and the queen, he was himself brought to trial, and was executed on the 28th of April 1794.

See MARINS et soldats français en Amérique, by the Viscomte de Nouilles (1903); BEATSON, Naval and Military Memoirs of Great Britain, vol. v.

Estate (through O. Fr. estat, mod. état, from Lat. status, state, condition, position, stare, to stand), the state or condition in which a man lives, now chiefly used poetically and in such phrases as "man's estate," or "of high estate"; "state" has superseded most of the uses of the word except (1) in property and (2) in constitutional law.
1. In the law of property the word is employed in several senses. In the widest sense a man's estate comprises his entire belongings; so much of it as consists of land and certain other interests associated therewith is his "real estate"; the rest is his "personal estate." The word is more particularly applied to interests in land, and in popular and general use "an estate" means the land itself. The strict technical meaning of "an estate" is an interest in lands, and this conception lies at the root of the English theory of property in land. "The first thing that the student has to do," says Joshua Williams (Law of Real Property), "is to get rid of the idea of absolute ownership. Such an idea is quite unknown to the English law. No man is in law the absolute owner of lands. He can only hold an estate in them." That is, the notion of tenure, of holding by a tenant from a lord, prevails. The last lord of all from whom all land was ultimately held was the king. Persons holding directly from the king and granting to others were the king's tenants in chief, and were the mesne lords of their tenants. 

Estates in land may be classified according to (1) the quantity of their interest or duration, (2) the time of enjoyment, and (3) the number and connexion of the tenants. According to (1), an estate may be either a freehold of inheritance or a freehold not of inheritance. A freehold of inheritance may be (a) an estate in fee simple, which is the largest estate a man can hold in English law, and comes close to the idea of absolute ownership, repudiated by Williams; an estate in fee simple is inheritable by a man's heirs generally, he has full powers of disposition over it, and may alienate the whole or part. (b) It may also be in limited fees, which are again subdivided into (i.) qualified or base fee, (ii.) fee conditional, so called at the common law, afterwards, on the passing of the statute De Donis Conditionalibus, fee tail, which may be general as to the heirs of a man's body, or special, as to the heirs male (or female) of his body. A freehold not of inheritance may be either (1) conventional, as an estate for life, which may be either an estate for one's own life or for the life of another (pur autre vie); (2) legal, or created by operation of law, as tenancy in tail after possibility of issue extinct (i.e. where an estate is given to a man and the heirs of his body by his present wife, and the wife dies without issue, the husband becomes tenant in tail after possibility of issue extinct); tenancy by curtesy (see CURTESY); tenancy in dower (see DOWER).

Estates not of freehold or less than freehold are subdivided into (i.) estates for years (often called estates for a term of years, the instrument creating it being termed a lease or demise, and the estate itself a leasehold interest); (ii.) estates at will, that is, where lands or tenements are let by one man to another to have and to hold at the will of the lessor; (iii.) estates at sufferance, where one comes into possession of land under a lawful title, and continues in possession after his title has descended. According to (2), estates are either in possession or in expectancy. Estates in expectancy are either (a) in remainder, which may be vested or contingent, or (b) in reversion (see REMAINDER, REVERSION).

According to (3), estates may be either (i.) in severalty, that is, the holding of an estate by a person in his own right only, without any other person being joined or connected with him in point of interest therein; (ii.) estates in joint tenancy (see JOINT); (iii.) coparcenary (q.v.); and (iv.) tenancy in common, where two or more hold the same land, by several and distinct titles, but with unity of possession. (See also REAL PROPERTY.)

2. In constitutional law an estate is an order or class having a definite share as such in the body politic, and participating either directly or by its representatives in the government. The system of representation by estates took its rise in western Europe during the 15th century, at a time when the feudal system was being broken up through various causes, notably the growing wealth and power of the towns. In the feudal council the clergy and the territorial nobles had alone a voice; but the 13th century, to quote Stubbs (Const. Hist. ii. 168, ed. 1873), "turns the feudal council into an assembly of estates, and draws the constitution of the third estate from the ancient local machinery which it concentrates." This is, allowing for differences of detail, true of other countries as well as England. To the two estates already existing, clergy and nobles, is added a third, that of the commons (burgesses and knights of the shire) in England, that of the roturiers in France (known as the tiers état). This division into three estates became the norm, but it was not universal, nor inevitable. Even in England there was a tendency to create other estates, the king for instance treating with the merchants separately for grants of money to be raised by taxing the general body of merchants in the country; and there was a similar tendency on the part of the lawyers. But for the accident of their sitting and voting together, the burgesses and knights of the shire would also have formed separate estates. In Aragon the cortes contained four estates (brasas or arms), the clergy, the great barons (ricos hombres), the minor barons (los hombres de menor renombre), and the single barons; the Spanish diet had also four—clergy, barons, burgesses and peasants.

The system of estates, based on the medieval conception of society as divided into definite orders, formed the basis of whatever constitutional forms survived in Europe till the French Revolution. In England, of course, it had early become obsolescent, the House of Commons representing the whole nation outside the narrow order of the peers. The creation of an estate of lesser nobles or landowners had been prevented by the fusion of the knights of the shire with the burgesses; the spiritual estate was ruled out by the determination of the clergy to deliberate and tax themselves in their own convocation, leaving the bishops, as spiritual peers, to represent their interests in parliament.

The phrase "the three estates of the realm" still survives, but to most men it conveys no clear meaning. The erroneous conception early arose, Hallam says it was current among the 16th or 17th centuries, that the House of Lords in the reign of Henry VIII., and the House of Commons, of Cromwell, were king, lords and commons, as representing the three great divisions of legislative authority. Such a conception might be possible in Hungary, where the crown of St Stephen symbolizes not so much the royal power as the co-ordination of the powers of all the organs of the state, including the king; but in England the king represents the whole nation and in no sense a separate interest within it, which is the essence of an estate. The phrase "three estates" as applied to the English constitution at present is, in fact, misleading. It is now usually understood of the lords spiritual, the lords temporal, and the commons.

The conception of the three estates of the realm as the great divisions of legislative authority led in England to the coining of the phrase "fourth estate," to indicate some power of corresponding magnitude in the state distinct from them. Fielding thus spoke of "the mob," and Hazlitt of Cobbett; the phrase is now usually applied to the press, a usage originating in a speech by Burke (Carlyle, Hero-worship, Lect. v.).

In the constitutional struggles of the European continent, from the Revolution onward, the rival theories of representation by estates and of popular representation have played a great part. The crucial moment of the French Revolution was when the vote according to "order" was rejected and the estates of the clergy and nobles were merged with the tiers étaient, the states-general thus becoming the National Assembly. This was the precedent followed, generally speaking, during the 19th century in the other countries in which constitutional govern...
ment was established. In most of them the medieval estates lingered on in provincial diets (Landstage); and the famous Article XIII. of the Federal Act (Bundesakte) of Vienna decreed that "assemblies of estates" should be set up, wherever not already existing, in the German states. The efforts of Metternich and the statesmen of his school were directed, not so much to abolishing the constitutional model, as to establishing it, if need be, on traditional and conservative lines. This is what was meant by the famous reply of the emperor Francis I. to the Magyar deputation: "All the world is playing the fool and demanding fanciful constitutions." When the need for making constitutional concessions became urgent, the attempt was accordingly made to base them on the system of estates. But the central diet convoked in 1847 by Frederick William IV. to Berlin, technically a concentration of provincial estates, quickly converted itself as Metternich had prophesied—into a national assembly; and precisely the same thing happened in the case of the first Austrian parliament in 1848. In Hungary the revolution was in some respects more conservative in character. The March Laws of 1848 preserved the general character of the House of Magnates, comparable to the British House of Lords, but converted the Lower House from what was practically representative of the estate of the lesser nobles into a national representative assembly of all the sovereign states of Europe; and the grand-duchies, while the only grand-duchies of Mecklenburg still (1900) retain the ancient system of estates untouched. The diet, which is common to the two duchies, consists of the Ritterschaft, in which all tenants in chivalry (Rittergutsbesitzer), whether noble or non-noble, have a voice, and the Landschaft, which consists of the chief magistrates of the towns. The former is taken as representative of the peasant proprietors and copy-holders (Hintersassen), the latter of the burghers.

The plural form Estates of States (Fr. états, Ger. Stände) is the name commonly given to an assembly of estates (assemblée des états, Ständeversammlung). When such an assembly is not merely local or provincial it is called the estates-general or states-general (états généraux), e.g. in France the assembly of the deputies of the three estates of the realm as distinct from the provincial estates which met periodically in the so-called pays d'états.

For further details about the estates in England and elsewhere see W. Stubbs, "English Constitutional History, vol. ii. (1896); H. Hallam, The Middle Ages (1855); F. W. Maitland, Constitutional History of England (1908); A. Luchaire, Histoire des institutions monarchiques de la France (1883-1885); G. Waite, Deutsche Verfassungsgeschichte (Kiel, 1865-1878); and A. S. Rait, The Scottish Parliament (1901). See also Representatives of the People and Representative Government.

ESTATE AND HOUSE AGENTS. A person exercising the calling of a house agent in England is required, under a penalty of £20, to take out yearly a licence upon which £2 is charged as a duty of excise, unless he is licensed as an auctioneer or appraiser, or an agent employed in the management of landed estates, or a solicitor or conveyancer who has taken out his annual certificate as such. In this connexion a person is deemed to be a house agent if he advertises for sale or for letting, or in any way negotiates for the selling or letting of any furnished house or part of any furnished house (any storey or flat rated and let as a separate tenement being for this purpose a house); subject, however, to the qualification that no one is to be deemed to be a house agent by reason of his letting, or offering to let, or in any way negotiating for the letting of, any house the annual rent or value of which does not exceed £25.

A house agent who is merely instructed to act in the usual way of his calling has no authority to bind his employer by a contract. His business is to endeavour to find a person willing to become a purchaser or tenant and then to communicate his offer to the owner. Unless express authority is given to him, he cannot act for, or let, and for that purpose enter into a binding contract, the principal reserves his right to accept or refuse the offer. As a rule, a house or estate agent has no authority to receive payment on behalf of the principal. Where he is em-

ployed to procure a tenant, he must use reasonable diligence to ascertain that the person to whom the property is let through his agency is fit to be a tenant. He does not, however, in any way guarantee the payment of the rent. A house agent may not, for or in expectation of payment, prepare any deed relating to the sale or letting of real or personal estate. There is, however, no similar prohibition as to agreements not under seal, and it is a common practice for house agents to charge for the preparation of them.

House agents are usually remunerated by way of commission. The scale adopted by the Institute of Estate and House Agents embodies the rates usually charged. In the absence of specific provision upon the subject between the principal and the agent, commission is payable only when the latter has found a purchaser or tenant. If, however, he had found a person willing to buy or take property upon the terms upon which the principal intimated to him his willingness to sell or let it, the principal will be liable to pay the amount of the commission, even though in fact he refuses or is unable to sell or let it. Where the agent can show that he has brought about a sale or tenancy he will be entitled to the commission notwithstanding the fact that another agent has been paid, or has recovered in an action, commission in respect of the same sale or tenancy. The agent's authority may be revoked at any time; but, where he has already performed the service for which he was engaged, the principal cannot defeat his right to be paid the amount of the commission by subsequently revoking his authority. If the agent is unsuccessful in finding a purchaser or tenant, as the case may be, he will not, as a rule, have any right to remuneration for his efforts in the matter.

Most auctioneers, in addition to holding auctions, carry on the business of house and estate agency. The number of licences issued to house agents and appraisers in England for the year ended 31st March 1899 was 4,429, and for the year ended 31st March 1900, 4,518. The number of licences issued to auctioneers in England for the corresponding periods was 6,389 and 6,543 respectively.

ESTATE DUTY. For purposes of the national revenue in the United Kingdom, the Finance Act 1894 imposed on all property passing by death after the 1st of August 1894 a duty called estate duty, in lieu of certain other duties previously payable. The objects of the act were—(1) simplification of the death duties and equalization as between real and personal property, and (2) aggregation of all the property passing on a person's death into one estate or a whole, and taxation of this estate graduated according to the value of the whole. Before the act's introduction the duty was levied only on the free personal property of deceased persons in the hands of the executor or administrator, without regard to the subsequent distribution. The legacy and succession duties were levied on distribution of the property passing on the death, from the persons taking any property under the will or intestacy of the deceased, or under settlement, or by devolution of title on his death. These two latter duties were mutually exclusive, and together covered practically all property passing by death. They were levied at rates graduated according to consanguinity. In 1888 an attempt was made to equalize the rates of the death duties as between property which paid the probate and legacy duties, and property which paid succession duty only. But the Finance Act 1894 replaced the probate duty by a duty extending to all property real or personal passing on or by reference to death, whether by disposition of the deceased or not, without regard to its tenure or destination. The Finance Acts of 1907 and 1909-1910 increased the scale of duties laid down in 1894.

For this purpose all property passing on a death is aggregated into an estate, on the capital value of which the duty is charged, at rates graduated from 1 to 15% according to the aggregate value. Besides the property of which the deceased was competent to dispose at his death, the aggregated estate includes property in which he had an interest ceasing on his death, from the cesser of which a benefit accrues, or which was disposed of by him within twelve months of death, or at any time, with reservation of an interest to himself. The extent to
which property is deemed to pass on the cesser of a limited interest is measured by the proportion of the income to which the interest extended, without regard to the tenure of the deceased or his successor. Property may therefore be included in the aggregate estate at its capital value owing to the passing of a life-interest only, the property being settled so that the absolute ownership does not pass at all. But when the duty has once been paid on property passing under a settlement, the property does not again become chargeable until it passes on the death of a person who is or has been competent to dispose of it.

To compensate for this advantage, when property passing under a settlement made after the act pays the estate duty, a further duty of 2% (settlement estate duty) is taken, except where the only subsequent life-interest is that of the wife or husband of the deceased.

The rate of duty being fixed according to the aggregate capital value of the whole estate, the charge is distributed according to the different modes of disposition of the property comprised in the estate. The duty on the personality which passes to the executor as such is paid by him, as the probate duty, and comes out of the estate. In the case of life-interest property placed in the hands of trustees, or any person to whom it passes for a beneficial interest in possession, are made accountable, and are required to bring in an account of the property and pay the duty. The duty is a first charge on such property, and, when it is paid by a person having a life-interest only, he may charge the corpus of the property with it. The duty on real property included in an account is payable by eight yearly or sixteen half-yearly instalments, becoming due twelve months after the death, and bearing interest at 3% from that date. On other property, except in a few special cases, the duty bears interest at 3% from the date of the death. When the estate duty has been paid no further duty is chargeable on property comprised in the estate which passes to lineal relations of the deceased. On property passing to collaterals or strangers legacy or succession duty, as the case may be, is payable by the devisees or successors, at a rate (which is the same whichever duty be payable) fixed according to consanguinity.

For a detailed account of the provisions of the act of 1894 and subsequent amending acts, and of the practical working of the duty, reference is made to Austin-Cartmell, Finance Acts (1894-1907); Hanson, Death Duties (London, 1904); Soward, Handbook to the Estate Duty (4th ed., London, 1900); and to the reports of the commissioners of Inland Revenue for 1894-1895 and subsequent years.

**ESTCOURT, RICHARD** (1668-1712), English actor, began by playing comedy parts in Dublin. His first London appearance was in 1704 as Dominick, in Dryden’s *Spanish Friar*, and he continued to take important parts at Drury Lane, being the original Ponce in Steele’s *Tender Husband* (1705), Sergeant Kite in Farquhar’s *Recruiting Officer*, and Sir Francis Gripe in Mrs Centlivre’s *Busybody*. He was an excellent mimic and a great favourite socially. Estcourt wrote a comedy, *The Fair Example, or the Modish Citizen* (1703), and *Prunella* (1704), an interlude.

**ESTE**, one of the oldest of the former reigning houses of Italy. It is in all probability of Lombard origin, and descended, according to Muratori, from the princes who governed in Tuscany in Carolingian times. The lordship of the town of Este was first acquired by Alberto Azzo II, who also bore the title of marquis of Italy1 (d. c. 1097); he married Kuniza or Kunginda, sister of Welf or Guelph III, died childless, and the dukedom of Bavaria passed successively by Welf IV, son of Kuniza, who married a daughter of Otto II, duke of Bavaria, and who obtained the duchy of Bavaria in 1070. Through him the house of Este became connected with the princely houses of Brunswick and Hanover, from which the sovereigns of England are descended. The Italian titles and estates were inherited by Folco I. (1060-1135), son of Alberto Azzo by his second wife Geserdes, daughter of Herbert I., count of Maine.2 The house of Este played a great part in the history of medieval and Renaissance Italy, and it first comes to the front in the wars between the Guelphs and Ghibellines; as leaders of the former party its princes received at different times Ferrara, Modena, Reggio and other feuds and territories.

Obizzo I., son of Folco, was the first to bear the title of marquis of Este. He entered into the Guelphic league against the emperor Frederick I., and was comprehended in the treaty of Venice of 1177 by which municipal *podestés* (foreigners chosen as heads of cities to administer justice impartially) were instituted. He was elected podestà of Padua in 1178, and in 1184 he was reconciled with Frederick, who created him marquis of Genoa and Milan, a dignity somewhat similar to that of imperial vicar. By the marriage of his son Azzo to the heiress of the Marchesella family (the story that she was carried off to prevent her marrying an enemy of the Este is a pure legend), he came to acquire great influence in Ferrara, although he was opposed by the hardly less powerful house of Torelli.

Obizzo died in 1194 and Azzo V. having predeceased him, the marquise devolved on his grandson Azzo VI. (1170-1212), who became head of the Guelph party, and to him the people of Ferrara sacrificed their liberty by making him their first lord (1208). But during his lifetime civil war raged in the city, between the Este and the Torelli, each party being driven out again and again. Azzo (also called Azzolino) died in 1212 and was succeeded by Aldobrandino I., who in 1213 concluded a treaty with Salinguerra Torelli, the head of that house, to divide the government of the city between them. On his death in 1215 he was succeeded by his brother Azzo VII. (1205-1264), surnamed Novello, but Salinguerra Torelli usurped all power in Ferrara and expelled Azzo (1222). In 1240 Pope Gregory IX. determined on another war against the emperor Frederick II., but deemed it wise to begin by crushing the chief Ghibelline houses. Thus Azzo found himself in league with the pope and various Guelph cities in his attempt to regain Ferrara. That town underwent a four months’ siege, and was at last compelled to surrender; Salinguerra was sent to Venice as a prisoner, and Azzo ruled in Ferrara once more. The Ghibelline party was suppressed, but the city enjoyed peace and happiness within, although her citizens took part in the wars raging outside. The Guelph cause triumphed, Frederick being defeated several times, and after his death Azzo helped in crushing the terrible Ecelino da Romano (q.v.) who upheld the imperial cause, at the battle of Cassano (1259). He died in 1264 and was succeeded by Obizzo II. (1240-1293) his grandson, who in 1288 received the lordship of Modena, and that of Reggio in 1289. He was a capable but cruel ruler, and while professing devotion to the Guelph cause, did homage to the German king Rudolph I. when he descended into Italy.

Obizzo II. died in 1293 and was succeeded by his son Azzo VIII., but the latter’s brothers, Aldobrandino and Francesco, who were to have shared in the government, were expelled and became his bitter enemies. The misgovernment of Azzo led to the revolt of Reggio and Modena, which shook off his yoke. Enemies arose on all sides, and he spent his last years in perpetual fighting. He died in 1308, and having no legitimate children, his brothers, his natural sons Fresor, and others disputed the succession. A peace settlement was appointed, and though the Este returned they were placed under pontifical tutelage.

The history of the house now becomes involved and of little interest until we come to Nicholas III. (1384-1441), who exercised sway over Ferrara, Modena, Parma and Reggio, waged many wars, was made general of the army of the Church, and in his later years governor of Milan, where he died, not without suspicion of poison. To him succeeded Lionel (1407-1450), a wise and virtuous ruler and a patron of literature and art; then Borso (1413-1471), his brother, who was created duke of Modena and Reggio by the emperor Frederick III., and duke of Ferrara by the pope. In spite of the wars by which all Italy was torn, Ferrara enjoyed a period of peace and prosperity under Borso; he patronized literature, established a printing-press at Ferrara, surrounded himself with learned men, and his court was of
unparalleled splendour. He also protected industry and commerce, and ruled with great wisdom. His brother Ercole I. (1431-1505), who succeeded him in 1471, was less fortunate, and had to engage in a war with Venice, owing to a dispute about the salt monopoly, with the result that by peace of 1484 he was forced to cede the district of Polese to the republic. But the last years of his life were peaceful and prosperous, so that afterwards men looked back to the days of Ercole I. as to a golden age; his capital was noted both for its luxury and as the resort of men eminent in literature and art. Biaordo the poet was his minister, and Ariosto obtained his patronage.

Ercole's daughter Beatrice d'Este (1475-1507), daughter of Milan, one of the most beautiful and accomplished princesses of Renaissance, was betrothed at the age of five to Lodovico Sforza (known as il Moro), duke of Bar, regent and afterwards duke of Milan, and was married to him in January 1491. She had been carefully educated, and availed herself of her position as mistress of one of the most splendid courts of Italy to surround herself with learned men, poets and artists, such as Niccolò da Correggio, Bernardo Castiglione, Bramante, Leonardo da Vinci and many others. In 1492 she visited Venice as ambassador for her husband in his political schemes, which consisted chiefly in a desire to be recognized as duke of Milan. On the death of Gian Galeazzo Sforza, Lodovico's usurpation was legalized, and after the battle of Fornovo (1495) both he and his wife took part in the peace congress of Vercelli between Charles VIII of France and the Italian princes, at which Beatrice showed great political ability. But her brilliant career was cut short by death through childbirth, on the 3rd of January 1497. She belongs to the best class of Renaissance women, and was one of the culture influences of the age; to her patronage and good taste are due a great extent the splendour of the Castello of Milan, of the Certosa of Pavia and of many other famous buildings in Lombardy.

Her sister Isabel Isabella d'Este (1474-1539), marchioness of Mantua, was educated both in letters and in the arts like Beatrice, and was married when barely sixteen to Francesco Gonzaga, marquis of Mantua (1499). She showed great diplomatic and political skill, especially in her negotiations with Cesare Borgia (q.v.), who had dispossessed Guidobaldo da Montefeltro, duke of Urbino, the husband of her sister-in-law and intimate friend Elisabetta Gonzaga (1502). She received the deposed duke and duchess, as well as other princes in the same condition, at her court of Mantua, which was one of the most brilliant in Italy, and like her sister she gathered together many eminent men of letters and artists, Raphael, Andrea Mantegna and Giulio Romano being among those whom she employed. Both she and her husband were greatly influenced by Baldassare Castiglione (1478-1520), author of Il Cortigiano, and it was at his suggestion that Giulio Romano was summoned to Mantua to enlarge the Castello and other buildings. Isabella was "undoubtedly, among all the princesses of the 15th and 16th centuries, the one who most strikingly and perfectly personified the aspirations of the Renaissance" (Eugen Müntz); but her character was less attractive than that of her sister, and in her love of collecting works of art she showed a somewhat grasping nature, being ever anxious to cut down the prices of the artists who worked for her.

To Ercole I. succeeded his son Alphonso I. (1486-1534), the husband of Lucrezia Borgia (q.v.), daughter of Pope Alexander VI. During nearly the whole of his reign he was engaged in the Italian wars, but by his diplomatic skill and his military ability he was for many years almost always successful. He was gifted with great mechanical skill, and his artillery was of world-wide reputation. On the formation of the league of Cambrai against Venice in 1508, he was appointed to the supreme command of the papal troops by Julius II.; but after the Venetians had sustained a number of reverses they made peace with the pope and were swept away by the French. Alphonso was invited to co-operate in the new combination, and on his refusal war was declared against him; but although he began by losing Modena and Reggio, he subsequently inflicted several defeats on the papal troops. He fought on the side of the French at the battle of Ravenna (1512), from which, although victorious, they derived no advantage. Soon afterwards they retired from Italy, and Alphonso, finding himself abandoned, tried to make his peace with the pope, through the mediation of Fabrizio Colonna. He went to Rome for the purpose and received absolution, but on discovering that Julius meant to detain him a prisoner, he escaped in disguise, and the pope's death in 1513 gave him a brief respite. But Leo X. proved equally bent on the destruction of the house of Este, when he too was cut off by death. Alphonso availed himself of the troubles of the papacy during the reign of the equally hostile Clement VII. to recapture Reggio (1523) and Modena (1527), and was confirmed in his possession of them by the emperor Charles V., in spite of Clement's opposition.

He died in 1534, and was succeeded by his son Ercole II. (1508-1539), who married Renée, daughter of Louis XII., of France, a princess of Protestant proclivities and a friend of Calvin. On joining the league of France and the papacy against Spain, Ercole was appointed lieutenant-general of the French army in Italy. The war was prosecuted, however, with little vigour, and peace was made with Spain in 1538. The duke and his brother, Cardinal Ippolito the Younger, were patrons of literature and art, and the latter built the magnificent Villa d'Este at Tivoli. He was succeeded by Alphonso II. (1533-1597), remembered for his patronage of Tasso, whom he afterwards imprisoned. He reorganized the army, enriched the public library, encouraged agriculture, but was extravagant and dissipated. With him the main branch of the family came to an end, and although at his death he bequeathed the duchy to his cousin Cesare (1533-1638), Pope Clement VIII., renewing the Church's hostility to the house of Este, declared that prince to be of illegitimate birth (a doubtful contention), and by a treaty with Lucrezia, Alphonso's sister, Ferrara was made over to the Holy See. Cesare held Modena and Reggio, but with him the Este line of marriage to the Este cadet house was cut off, and the Este claims to the Duchy of Milan were extinguished.

For two centuries this dynasty had been one of the greatest powers in Italy, and its court was perhaps the most splendid in Europe, both as regards pomp and luxury and on account of the eminent artists, poets and scholars which it attracted.

The subsequent heads of the family were: Alphonso III., who retired to a monastery in 1620 and died in 1644; Francis I. (1610-1658), who commanded the French army in Italy in 1647; Alphonso IV. (1634-1662), the father of Mary Beatrice, the queen of James II. of England, who fought in the French army during the Spanish War, and founded the picture gallery of Modena; Francis II. (1660-1694), who originated the Esti library, also at Modena, and founded the university; Rinaldo (1653-1737), through whose marriage with Charlotte Felicita of Brunswick-Lüneburg the long-separated branches of the house of Este were reunited; Francis III. (1698-1780), who married the daughter of the regent Philip of Orleans. Francis IV. ruled a small principality neutral during the war between Spain and Austria (1740), but the imperialists having occupied and devastated his duchy, he took the Spanish side and was appointed generalissimo of the Spanish army in Italy. He was re-established in his possessions by the treaty of Aix-la-Chapelle (1748), and being reconciled with the empress Maria Theresa, he received from her the title of governor of Lombardy in 1754. With his son Ercole III. Rinaldo (1727-1803), who at the peace of Campoformio lost his duchy, the male line of the Este family came to an end. His only daughter, Marie Beatrice (d. 1829), was married to the archduke Ferdinand, third son of the emperor Francis I. Ferdinand was created duke of Breisgau in 1803, and at his death in 1806 he was succeeded by his son Francis IV. (q.v.), to whom the duchy of Modena was given at the treaty of Vienna in 1814. He died in 1846 and was succeeded by Francis V. (q.v.), who lost his possessions by the events of 1859. With his death in 1875 the title and estates passed to the archduke Francis Ferdinand, heir to the Austro-Hungarian throne. The children of Lady Augusta Murray, daughter of the earl of Dunmore, by her marriage with Augustus Frederick, duke of Sussex, sixth son of George III. of Great Britain, assumed the old name of
d’Este, and claimed recognition as members of the royal family; but as the marriage was in violation of the royal marriages act of 1773, it was declared invalid, and their claims were set aside.

Muratori, Della antica storia e storia moderna (13 vols., 1745-1815), the chief and most reliable authority on the subject, containing a quantity of documents; A. Frizzi, Memorie per la storia di Ferrara (2 ed., Ferrara, 1847); A. Solerti, Ferrara e la corte estense nella seconda metà del sec. XVII. (Città di Ferrara, 1900); C. Antonelli, Il dominio estense in Ferrara (Ferrara, 1890), which deals with the siege of 1240 and other special points; E. G. Gardner, Princes and Poets of Ferrara (London, 1904), a bulky volume dealing only with the Renaissance period, full of anachronisms and unverifiable information, with no special knowledge of the literary and artistic associations of the house, but not well put together (contains good bibliography); G. Bertoni, La Biblioteca estense e la coltura ferrarese ai tempi del duca Erolo I. (Turin, 1905), useful for the literary aspect of the subject; P. Litta, Le Celebri Famiglie italiane, vol. iii. (Milan, 1831), still a valuable work: E. Noyes, The Story of Ferrara (London, 1904); Julia Cartwright’s Isabella d’Este (London, 1903), and Beatrice d’Este (1890), pleasantly written but amateurish volumes based on A. Luzzo’s Mantegna e Urbino (Turin, 1891); A. Luzio and R. Renier, “Delle relazioni di Isabella d’Este Gonzaga con Lodovico e Beatrice Sforza” (Milan, 1890, Archivio Storico Lombardo, xvii.).

Este (anc. Aste, q.v.), a town and episcopal see of Venetia, Italy, in the province of Padua, 20 m. S.S.W. of it by rail. Pop. (1901) 8671 (town); 10,779 (province). It lies 40 ft. above sea-level below the southern slopes of the Euganean Hills. The extensiveness of the ground that rises above the town on the N., but the interior is now occupied by the cattlemarket. A fragment of the once enormous Palazzo Mocenigo, of the 16th century, is now occupied by the important archaeological museum (see ATESTE). The cathedral was erected in 1600-1720, on the site of an older building destroyed by an earthquake in 1688. S. Martino is a church in the Lombardesque style. The archives in the Palazzo Comunale are important.

After the Roman period the history of Este is a blank until the Lombard period, in which it was dependent on Monselese. In the 10th century the family of Este (see above) established itself in the castle above the town. At the end of the 13th century Padua, which had already captured Este more than once, became definitely mistress of it. When the Carrara family succeeded in 1405, Este voluntarily surrendered to Venice and was allowed its independence, under a podestà; and thenceforth it followed the history of the city.

ESTÉBANÉZ CALDERÓN, Serafin (1799-1867), a Spanish author, best known by the pseudonym of “El Solitario,” was born at Malaga on the 27th of December 1799. His first literary effort was El Liston verde, a poem signed “Safinio” and written to celebrate the revolution of 1820. He was called to the bar, and settled for some time at Madrid, where he published a volume of verses in 1831 under the assumed name of “El Solitario.” He obtained an exaggerated reputation as an Arabic scholar, and played a minor part in the political movements of his time. He died at Madrid on the 5th of February 1867. His most interesting work, Escenas indígenas (1847), is in a curiously affected style, the vocabulary being partly archaic and partly provincial; but, despite its eccentric mannerisms, it is a vivid record of picturesque scenes and local customs. Estébanéz Calderón is also the author of an unfinished history, De la conquista y pérdida de Portugal (1883), issued posthumously under the editorship of his nephew, Antonio de Miranda y Ramón, who assumed the name of Estébanéz as a mark of respect.

ESTELLA, a town of northern Spain, in the province of Navarre, on the left bank of the river Ega, 15 m. W.S.W. of Pamplona. Pop. (1900) 5726. Estella, which occupies the site of a Roman town of uncertain name, contains several monasteries and churches, a medieval citadel, and a college which was formerly a university. Its principal industries are the manufacture of woolen and linen fabrics and brandy-making; and it has a considerable trade in fruit, wine and cattle. Estella commands several defiles on the roads from Castle and Aragon, and on that account occupies a position of considerable strategic importance. It was long the headquarters of Don Carlos, who was proclaimed king here in 1813. In 1873 it was the chief stronghold of the Carlists, and in 1874, when driven from other places, they succeeded in retiring to Estella. On the 16th of February 1876 the Carlists in the town surrendered unconditionally. For an account of the Carlist rising see SPAIN: History.

ESTERHÁZY, a noble Magyar family. Its origin has been traced, not without some uncertainty, to Salamon of Eszteras, who bestowed the manor of Lylyesz in 1388. Peter founded the family of Zerházy, and Illyész that of Ilyeszyházy, which became extinct in the male line in 1388. The first member of the family to emerge definitely into history was Ferencz Zerházy (1563-1594), vice lord-lieutenant of the county of Pressburg, who took the name of Esterházy when he was created Freiherr of Galantha, an estate acquired by the family in 1421. His eldest son, Daniel (d. 1654), founded the house of Czesnek, the third, Pal (d. 1641), the line of Zolyom (Altsohl), and the fourth, Miklós, that branch of the family which occupies the most considerable place in Hungarian history, that of Fraknó or Forchtenstein.

This Miklós [Nicholas] Esterházy of Galantha (1582-1645) was born at Galantha on the 8th of April 1582. His parents were Protestants, and he himself, at first, followed the Protestant persuasion; but he subsequently went over to Catholicism and, along with Cardinal Pázmány, his most serious rival at court, opposed the ecclesiastical, political and national reforms of the century, both religiously and politically, and a worthy opponent of the two great Protestant champions of the period, Gabriel Bethlen and George Rákóczi. In 1611 he married Orsolya, the widow of Ferencz Mágoczy, thus coming into possession of her gigantic estates, and in 1622 he acquired Fraknó. Matthiaus II. made him a baron (1615), count of Beregh (1617), and lord-lieutenant of the county of Zolyom and magister curiae regiae (1618). At the coronation of Ferdinand II., when he officiated as grand-standard-bearer, he received the order of the Golden Fleece and fresh donations. At the diet of Sopron, 1625, he was elected palatine of Hungary. As a diplomatist he powerfully contributed to bring about the peace of Nönburg (1622) and the peace of Linz (1645) (see HUNGARY: History). His political ideal was the consolidation of the Habsburg dynasty as a means towards freeing Hungary from the Turkish yoke. He himself, on one occasion (1629), defeated the Turks on the banks of the Nyitra; but anything like sustained operations against them was then impossible. He was also one of the most eminent writers of his day. He died at Nagy-Hidef on the 11th of September 1645, leaving five sons.

See Works of Nicholas Esterházy, with a biography by Ferencz Toldi (Hun.) (Pest, 1852); Nicholas Count Esterházy, Palatine of Hungary (a biography, Hun.) (Pest, 1863-1866); and Prince Pal Pál Antal (Pest, 1921), prince palatine, founded the princely branch of the family of Esterházy. He was born at Kis Marton (Eisenstadt) on the 7th of September 1635. In 1663 he fought, along with Miklós Zrínyi, against the Turks, and distinguished himself under Montecuculi. In 1667 he was appointed commander-in-chief in south Hungary, where he defeated the malcontents at Leutschau and Györk. In 1681 he was elected palatine. In 1683 he participated in the deliverance of Vienna from the Turks, and entered Buda in 1686 at the head of 20,000 men. Thoroughly reactionary, and absolutely devoted to the Habsburgs, he contributed more than any one else to the curtailing of the privileges of the Magyar gentry in 1687, when he was created a prince of the Empire, with (in 1712) succession to the first-born of his house. His “aunc tendencies made him so unpopular that his offer of mediation between the Rákóczi insurgents and the government was rejected by the Hungarian diet, and the negotiations, which led to the peace of Szatmár (see HUNGARY: History), were entrusted to János Pálffy. He died on the 26th of March 1714. He loved the arts and sciences, wrote several religious works, and was one of the chief compilers of the Tropheum Domus Inulvae Esterienses. See Lajos Merényi, Prince Paul Esterházy (Hun.) (Budapest, 1895).

Prince Pál Antal, grandson of the prince palatine Pál, was a distinguished soldier, who rose to the rank of field-marshal in 1738. On his death in 1762 he was succeeded by his brother.
ESTERS

Prince Miklós József [Nicholas Joseph] (1714–1790), also a brilliant soldier, is perhaps best remembered as a patron of the fine arts. For his services in command of an infantry brigade at Kolín (1757) he was specially mentioned by Count Daun, and became one of the original members of the order of Maria Theresa. In 1762 he was appointed captain of Maria Theresa’s Hungarian bodyguard, in 1764 Feldzeugmeister, and in 1766 field marshal. His other honours included the Golden Fleece and the grade of commander in the order of Maria Theresa. Joseph II. conferred the princely title, which had previously been limited to the eldest-born of the house, on all his descendants, male and female. Esterházy died in Vienna on the 28th of September 1790. He rebuilt in the Renaissance style Schloss Esterházy, the splendour of which won for it the name of the Hungarian Versailles. Haydn was for thirty years conductor of his private orchestra and general musical director, and many of his compositions were written for the private theatre and the concerts of this prince.

His grandson, Prince Miklós [Nicholas] (1765–1833) was born on the 12th of December 1765. He began life as an officer in the guards, subsequently making the grand tour, which first awakened his deep interest in art. He quit the army for diplomatic service, was raised to the rank of Feldzeugmeister, and was employed as extraordinary ambassador, on special occasions, when he displayed a magnificence extraordinary even for the Esterházs. He made at Vienna an important collection of paintings and engravings, which came into the possession of the Hungarian Academy at Budapest in 1865. At his summer palace of Kis Marton (Eisenstadt) he erected a monument to Haydn. His immense expenditure on building and the arts involved the family in financial difficulties for two generations. When the French invaded Austria in 1797, he raised a regiment of 1000 men at his own expense. In 1809, when Napoleon invited the Magyars to elect a new king to replace the Habsburgs, overtures were made to Prince Nicholas, who refused the honour and, further, raised a regiment of volunteers in defence of Austrian interests. He died at Como on the 24th of November 1833.

His son, Prince Pál Antal [Paul Anthony] (1786–1866), entered the diplomatic service. In 1806 he was secretary of the embassy in London, and in 1807 worked with Prince Metternich in the same capacity in Paris. In 1810 he was accredited to the court of Dresden, where he tried in vain to detach Saxony from Napoleon, and in 1814 he accompanied his father on a secret mission to Rome. He took a leading part in all the diplomatic negotiations consequent upon the wars of 1813–1815, especially at the congress of Châtillon, and on the conclusion of peace, was the express desire of the prince regent, sent as ambassador to London. In 1824 he represented Austria as ambassador extraordinary at the coronation of Charles X., and was the premier Austrian commissioner at the London conferences of 1830–1836. In 1842 he quitted diplomacy for politics and attached himself to “the free-principles party.” He was minister for foreign affairs in the first responsible Hungarian ministry (1848), but resigned his post in September because he could see no way of reconciling the court with the nation. The last years of his life were spent in comparative poverty and isolation, as even the Esterházy forechtenstein estate was impoverished by his fabulous extravagance and had to be placed in the hands of curators.

The cadet branch of the house of Fraknó, the members of which bear the title of count, was divided into three lines by the sons of Ferencz Esterházy (1641–1683).

The eldest of these, Count Antal (1676–1722), distinguished himself in the war against Rákóczi in 1703, but changed sides in 1704 and commanded the left wing of the Kuruczis at the engagements of Nagyszombat (1704) and Vereskó (1705). In 1706 he defeated the imperial general Guido Stahremberg and penetrated to the walls of Vienna. Still more successful were his operations in the campaign of 1708, when he ravaged Styria, twice invaded Austria, and again threatened Vienna, on which occasion the emperor Joseph narrowly escaped falling into his hands. In 1709 he was routed by the superior forces of General Sigbert Heister at Palota, but brought off the remainder of his arms very skilfully. In 1710 he joined Rákóczi in Poland and accompanied him to France and Turkey. He died in exile at Rodosto on the shores of the Black Sea. His son Bálint József [Valentine Joseph], by Anna Maria Nigrelli, entered the French army, and was the founder of the Hallywely, or French, branch of the family, which became extinct in the male line in 1876 with Count Ládislas.

See Count Esterházy’s Campaign Diary (Hung.), ed. by K. Thaly ( Pest, 1901).

Count Bálint Miklós (1740–1805), son of Bálint József, was an enthusiastic partisan of the duc de Choiseul, on whose dismissal, in 1764, he resigned the command of the French army, to which he was the colonel. It was Esterházy who conveyed to Marie Antoinette the portrait of Louis XVI, on the occasion of their betrothal, and the close relations he maintained with her after her marriage were more than once the occasion of remonstrance on the part of Maria Theresa, who never seems to have forgotten that he was the grandson of a rebel. At the French court he stood in high favour with the comte d’Artois. He was raised to the rank of maréchal de camp, and made inspector of troops in the French service in 1780. At the outbreak of the French Revolution, he was stationed at Valenciennes, where he contrived for a time to keep order, and facilitated the escape of the French emigrés by way of Namur; but, in 1790, he hastened back to Paris to assist the king. At the urgent entreaty of the comte d’Artois in 1791 he quitted Paris for Coblenz, accompanied Artois to Vienna, and was sent to the court of St. Petersburg the same year to enlist the sympathies of Catherine II. for the Bourbons. He received an estate from Catherine II., and although the gift was rescinded by Paul I., another was eventually granted him. He died at Grodek in Volhynia on the 23rd of July 1805.

See Mémoires, ed. by E. Daudet (Fr.) (Paris, 1905), and Lettres (Paris, 1806).

Two other sons of Count Ferencz (d. 1685), Ferencz and József, founded the houses of Dotis and Cseklész (Landschütz) respectively. Of their descendants, Count Mórócsz (1807–1890) of Dotis, Austrian ambassador in Rome until 1856, became in 1861 a member of the ministry formed by Anton Schmerling, and in 1865 joined the clerical cabinet of Richard Belcredi. His bitter hostility to Prussia helped to force the government of Vienna into the war of 1866. His official career closed in 1866, but he remained one of the leaders of the clerical party.

(R. N. B.)

ESTERS, in organic chemistry, compounds formed by the condensation of an alcohol and an acid, with elimination of water; they may also be considered as derivatives of alcohols, in which the hydroxyl hydrogen has been replaced by an acid radical, or as acids in which the hydrogen of the carboxyl group has been replaced by an alkyl or aryl group. In the case of the polybasic acids, all the hydrogen atoms can be replaced in this way, and the compounds formed are known as “neutral esters.” If, however, some of the hydrogen of the acid remain undisplaced, then “acid esters” result. These acid esters retain some of the characteristic properties of the acids, forming, for example, salts, with basic oxides. Esters may be prepared by heating the silver salt of an acid with an alkyl iodide; by heating the alcohol or alcohohes with an acid chloride; by distilling the anhydrous sodium salt of an acid with a mixture of the alcohol and concentrated sulphuric acid; or by heating for some hours on the water bath, a mixture of an acid and an alcohol, with a small quantity of hydrochloric or sulphuric acids (E. Fischer and A. Speier, Ber., 1896, 28, p. 3254).

The esters of the aliphatic and aromatic acids are colourless neutral liquids, which are generally insoluble in water, but readily dissolve in alcohol and ether. Many possess a fragrant odour and are prepared in large quantities for use as artificial fruit essences. They hydrolyse readily when boiled with solutions of caustic alkalies or mineral acids, yielding the constituent acid and alcohol. When heated with ammonia, they yield acid amides (q.v.). They form unstable addition products with sodium ethylate or methylate. With the Grignard reagent, they
form addition compounds which on the addition of water yield tertiary additional compounds, except in the case of ethyl formate, where a secondary alcohol is obtained. 

\[
\text{R-CO}_2\text{H} + \text{H}_2\text{O} \rightarrow \text{R-CH(OH)O-H}
\]

It was found that the normal primary alcohols were all esterified at about the same rate, the secondary alcohols more slowly than the primary, and the tertiary alcohols still more slowly. The investigation of the nature of the acid used led to the result, for in an homologous series of acids it was found that as the molecular weight of the acid became more complex the rate of esterification became less. The formation of an ester by the interaction of an acid with an alcohol is a "reversible" or "balanced" action, for as M. E. esterification was shown by L. Péan de St Gilles (Ann. Chim. Phys., 1865, 6, p. 385 et seq.) have shown in the case of the formation of ethyl acetate from ethyl alcohol and acetic acid, a point of equilibrium is reached, beyond which the reacting system cannot pass, unless the system be disturbed in some way; for otherwise the mixture would remain as the products of the reaction. 

V. Meyer (Ber., 1894, 27, p. 510 et seq.) showed that in benzene compounds ortho-substituents exert a hindering effect on the esterification of acids by acids in the presence of alcohol, the higher the acid, this hindering being particularly marked when two substituents are present in the ortho positions to the carbonyl group. In such a case the ester is best prepared by the action of an alkyl halide on the salt of the acid, and when prepared in a solution, the reaction produces an o-alkyl ester, while with an acid, an o-alkyl ester is produced. 

Ethyl formate, H-CO\(_2\)CH\(_3\), boils at 55 \(^\circ\)C. and has been used in the artificial preparation of rum. Ethyl acetate (acetic ether), CH\(_3\)COOCH\(_3\), boils at 75 \(^\circ\)C. Isomylisovalerate, C\(_6\)H\(_5\)COOCH\(_3\), boils at 231 \(^\circ\)C. Ethyl formate can be obtained by the action of hydrochloric acid on a mixture of the crude formic acid, is also obtained by the acidification of the products of the reaction. 

The first step in the synthesis of ethyl formate is the distillation of ethyl alcohol with anhydrous hydrochloric acid. The mixture is then heated to a temperature of 187-188 \(^\circ\)C. with partial decomposition. It is used as a methylating agent (F. Ullmann). Great care should be taken in using dimethyl and diethyl sulphates, as the respiratory organs are affected by the vaporizing fumes in severe cases of pneumonia. Ethyl nitrate, C\(_2\)H\(_5\)NO\(_3\), is a colourless liquid which boils at 86-93 \(^\circ\)C. It is prepared by the action of nitric acid on ethyl alcohol (some urea being added to the nitric acid, in order to destroy any nitric acid that might be decomposed in secondary reactions and which, if not removed, would cause explosive decomposition of the ethyl nitrate). It burns with a white flame and is soluble in water. When heated with ammonia it yields ethylamine nitrate, and when reduced with tin and hydrochloric acid it forms hydrazine gas (n.g.). 

C\(_2\)H\(_5\)NO\(_3\), is a liquid which boils at 187 \(^\circ\)C.; the crude product obtained by distilling a mixture of alcohol, sulphuric acid and nitric acids and copper turnings in use in medicine under the name of "sweet spirits of nitrous acid," is distilled in water, and is used in the preparation of the anhydrous dianisyl nitrate (E. Knoevenagel, Ber., 1890, 23, p. 2094). It is also used in medicine.

ESTHER.

The Book of Esther, in the Bible, relates how a Jewish maiden, Esther, cousin and foster-daughter of Mordecai, was made his queen by the Persian king Ahasuerus (Xerxes) after he had divorced Vashti; next, how Esther and Mordecai frustrated Haman’s endeavour to extirpate the Jews; how Haman, the grand-vizier, fell, and Mordecai succeeded him; how Esther obtained the king’s permission for the Jews to destroy all who might attack them on the day which Haman had appointed by lot for their destruction; and lastly, how the feast of Purim (Lots ?) was instituted to commemorate their deliverance. Frequent incidental references are made to Persian court-usages (explanations are given in i. 13, viii. 8), while on the other hand the religious rites of the Jews (except fasting), and even Jerusalem and the temple, and the name of Israel, are studiously ignored. Even the name of God is not once mentioned, perhaps from a dread of its profanation during the Saturnalia of Purim. The early popularity of the book is shown by the interpolated passages in the Septuagint and the Old Latin versions.

The criticism of Esther began in the 18th century. As soon as the questioning spirit arose, the strangeness of many statements in the book leaped into view. A moderate scholar of our day can find no historical nucleus, and calls it a sort of historical romance. The very first verses in the book startle the reader by their exaggerations, e.g., a banquet lasting 186 days, “127 provinces.” Farther on, the improbabilities of the plot are noticeable. Esther, on her elevation, keeps her Jewish origin secret (ii. 10; cf. vii. 3 ff.), although she has been taken from the house of her uncle, who is known to be a Jew (iii. 4; cf. vi. 13), and has remained in constant intercourse with him (ii. 11, 19, 20, 22; cf. iv. 1-7). We are further told that the grand-vizier was an Agagite or Amalekite (iii. 2, &c.); would the nobility of Persia have tolerated this? Or did Haman too keep his non-Persian origin secret? Also that Mordecai offered a great affront to Haman, for which no slighter punishment would satisfy Haman than the destruction of the whole Jewish race (ii. 2-6). Of this savage design eleven months’ notice is given (iii. 12-14); and when the danger has been averted by the cleverness of Esther, the provincial Jews are allowed to butcher 75,000, and those in the capital 500 of their Persian fellow-subjects (ix. 6-16).

It is urged, on the other hand, that the assembly mentioned in i. 3 may be that referred to by Herodotus (vii. 8) as having preceded the expedition against Greece. This hypothesis, however, requires us to suppose that Xerxes had returned from Sardis to Susa by the tenth month of the seventh year of his reign, which is barely credible. In the reckoning of 127 provinces (cf. Dan. vi. 1; Esth. iii. 2) satrapies and sub-satrapies may be confounded. It is at any rate correct to include India among the provinces; this is justified, not only by Herodotus (iii. 46), but by the inscriptions of Darius at Persepolis and Naskh-i-Rustam. Herodotus again (vii. 8) confirms the custom referred to in Esth. xi. 2. But what authority can make the conduct of Mordecai credible? To-day the harem is impenetrable, while “any one declining to stand as the grand-vizier passes is almost beaten to death.” This, surely, is what a real Mordecai would have suffered from a real Haman. Even the capricious Xerxes would never have permitted the entire destruction of one of the races of the empire, nor would a vizier have proposed it. 

Serious difficulties of another kind remain. Mordecai is represented as a fellow-captive of Jechoniah (597 b.c.), and grand-vizier in Xerxes’s twelfth year (474 b.c.). This is parallel to the strange statement in Tobit xiv. 15. And how can we find room for Esther as queen by the side of Amestris (Herod. vii. 14, i. 112)? How, too, can a Jewess have been a legal queen (Herod. viii. 84)? Then take the supposed Persian propernames. 

Ahasuerus” may no doubt stand, but very few of the rest (see Nitzche, Enzyk. Bibl. col. 140) can remain solid facts. The story is general in character, it is true, but it points to a late date (see Driver, Introd., p. 454). Altogether, critics decline to date the book earlier than the 3rd or even 2nd century B.C.

So far we have only been carrying on 18th-century criticism. In more recent years, however, new lines of inquiry have been opened up. First of all by the great Semitic scholar Lagarde. His thesis (seldom defended now) was that Purim corresponds to Fürdigan, the name of the old Persian New Year’s and All Souls’ festival held in spring, on which the Persians were wont to exchange presents (cf. Esth. ix. 10). In 1891 came a new explanation of Esther from Zimmern. It is true that in its earlier form his theory was very incomplete. But in justice to this scholar we may notice that from the first he looked for light to Babylonia, and that many other critics now take up the same

1 Kautzsch, Old Testament Literature (1898), p. 130.
2 So Morier, The English minister to the Persian court, quoted by Dean Stanley.
position. There is also another new point which has to be mentioned, viz. that, judging from our experience elsewhere, the Book of Esther has probably passed through various stages of development. Here, then, are two points which call for investigation, viz. (1) a possible mythological element in Esther, and (2) possible stages of development prior to that represented by the Hebrew text.

As to the first point. The Second Targum (on Esth. ii. 7) long ago declared that Esther was so called “because she was like the planet Venus.” Recent scholars have expressed the same idea more critically. Esther is a modification of Ishhtar, the name of the Babylonian goddess of fertility and of the planet Venus, whose myth must have been partially known to the Israelites even in pre-exilic times, and after the fall of the state must have acquired a still stronger hold on Jewish exiles. A general knowledge of the myth of Marduk among the Israelites cannot indeed be proved. Singularly enough, the Babylonian colonists in the cities of Samaria are said to have made idols, not of Marduk, but of a deity called Suctoch-benob (2 Kings xvii. 30). Nor does the Second Targum help us here; it gives a wild explanation of Mordecai as “pure myrrh.” Still it is plain that the name of the god Marduk, lights of which was known to the Jews, and the Cosmogony in Gen. i. is considered by critics to have ultimately arisen out of the myth of Marduk’s conflict with the dragon (see Cosmogony). At any rate the name Mordecai (the vocalization is uncertain) looks very much like Marduk, which, with terminations added, often occurs in cuneiform documents as a personal name. Add to this, that, according to Jensen, Ishhtar in mythology was the cousin of the Jew, just as the legend represents Esther as the cousin of Mordecai.

The same scholar also accounts for Esther’s other name Hadassah (Esth. ii. 7); hadassatu in Babylonian means “bride,” which may have been a title of Ishhtar.

But we cannot stop short here. Unless the mythological key can also explain Haman and Vashti, it is of no use. Jensen, now followed by Zimmerm, is equal to the occasion. Haman, he says, is a corruption of Hamman or Humman or Uman, the name of the chief deity of the Elamites, in whose capital (Susia) the scene of the narrative is laid, while Vashti is Mashti (or Vashit), probably the name of an Elamite goddess.

Following the real or fancied light of these names, Prof. Jensen holds that the Esther-legend is based on a mythological account of the victory of the Babylonian deities over those of Elam, which in plain prose means the deliverance of ancient Babylonia from its Elamite oppressors, and that such an account was closely connected with the Babylonian New Year’s festival, called Zaggur, just as the Esther-legend is connected with the festival of Purim.

We are bound, however, to mention some critical objections. (1) The Babylonian festival corresponding to Purim was not the spring festival of Zaggur, but the summer festival of Istar, which is probably the Sacaen of Berosus, an orgiastic festival analogous to Purim. (2) According to Jensen’s theory, Mordecai, and not Esther, ought to be the direct cause of Haman’s ruin. (3) No such Babylonian account as Jensen postulates can be indicated. (4) The identifications of names are hazardous. Fancy a descendant of Kish called Marduk, and an “Agagite” called Haman! Elsewhere Mordecai ( Ezra ii. 2; Neh. vii. 7) occurs among names which are certainly not Persian (Biqual is no exception), and Haman ( Tobit xiv. 10) appears as a nephew of Achiachar, which is not a Persian name. Esther, moreover, ought to be parallel to Judith; fancy likening the representative of Israel to the goddess Ishtar?

Next, as to the preliminary literary phases of Esther. Such phases are probable, considering the later phases represented in the Septuagint. There may have once existed in Hebrew a story of the deadly feud between Mordecai (if that be the original name) and Haman, with elements suggested by the story of the battle between the Supreme God and the dragon (see Cosmogony). As the legend stands, Mordecai and Esther seem to be in each other’s way. In a passage ( i. 5 in LXX.) only found in the Septuagint, but which may have belonged to the original Esther, reference is made to a dream of Mordecai respecting two great dragons, i.e. Mordecai and Haman (x. 7). This seems to confirm the view here mentioned. If so, however, there must also have been an Esther-legend, which was afterwards worked up with that of Mordecai. This is, in fact, the view of Erbit. Winckler takes a different line. Linguistic facts and certain points in the contents seem to him to show that our Esther is a work of the age of the Seleucidae; more precisely he thinks of the time of the revolt of Molon against Antiochus III. Of course there was a Book of Esther before this, and even in its redacted form our Esther reflects the period of three Persian kings, viz. Cyrus, Cambyses and Darius. Lastly, Cheyne (Encyc. Bib. “Purim,” § 7), while agreeing with Winckler that the book is based on an earlier narrative, holds that that earlier text differed more widely from the present in its geographical and historical setting than Winckler seems to suppose. The problem of the origin of the name Purim, however, can hardly be said to have received a final solution.

**ADDITIONS TO BOOK OF ESTHER.** These “additions” were written originally in Greek and subsequently interpolated in the Greek translation of the Book of Esther. Here the principle of interpolation has reached its maximum. Of 270 verses, 107 are not to be found in the Hebrew text. These additions are distributed throughout the book in the Greek, but in the Latin Bible they were relegated to the end of the canonical book by Jerome—an action that has rendered them meaningless. In the Greek the additions form with the canonical text a consecutive history. They were made probably in the time of the Maccabees, and their aim was to supply the religious element which is so completely lacking in the canonical work. The first, which gives the dream of Mordecai and the events which led to his advancement at the court of Artaxerxes, precedes chap. i. of the canonical text: the second and fifth, which follow i. 13 and vii. 12, furnish copies of the letters of Artaxerxes referred to in these verses; the third and fourth, which are interpolated into chap. iv., consist of the prayers of Mordecai and Esther, with an account of Esther’s approach to the king. The last, which closes the book, tells of the institution of the feast of Purim. The Greek text appears in two widely-differing recensions. The one is supported by ABn, and the other—a revision of the first—by codices 19, 39a, 808(65). The latter is believed to have been the work of Lucian. Swete, Old Test. in Greek, ii. 755, has given the former, while Lagarde has published both texts with critical annotations in his Librum Veteris Testamenti Canoniciorum, i. 504-541 (1883), and Scholz in his Kommentar über das Buch Esther (1892).

For an account of the Latin and Syriac versions, the Targums, and the later Rabbinic literature connected with this subject, and other relating to these additions, see Frings, Exeg. Handbuch zu den Apok. (1891), i. 67-108; Schürer (1), iii. 330-332; Fuller (A T. A. P. i. 360-402; RysSEL in Kautzsch’s Apok. u. Pseud. i. 193-211; Stegfeld in Jewish Encyc. 1897, sqq.; Secord in The Old Test. in Greek, 257 sqq.; L. B. Paton, “A Text-Critical Appendix to the Book of Esther” i. O.T. and Semitic Studies in Memory of W. R. Harper (Chicago, 1908).

**ESTONIA.** (Ger. Estland and Estland, Estonian Eesti-maa and Meei-maa, also Võruma and Rahvuma; Lesslie Igauun Senna), a Baltic province of Russia, stretching along the south coast of the Gulf of Finland, and having Lake Pihaus and Livonia on the S. and the government of St Petersburg on the E. An archipelago of islands, of which Dagö is the largest, belongs to this government (Osel belongs to Livonia). The area is 7818 sq. m., 503 sq. m. of this being insan. The surface is low,
not exceeding 100 ft. in altitude along the coast and alongside Lake Peipus, while in the interior the average elevation ranges from 200 to 300 ft., and nowhere exceeds 450 ft. It was entirely covered with the bottom moraine of the great ice-sheet of the Glacial Epoch, resting upon Silurian sandstones and limestones. In places sands and clays overlie the glacial deposits. The principal stream is the Narova, which issues from Lake Peipus, flows along the eastern border, and empties into the Gulf of Finland. The other drainage arteries are all small, but many in number; while lakes and marshes aggregate fully 22% of the total surface. The climate is severe, great cold being experienced in winter, though moist west winds exercise a moderating influence. Nevertheless the annual mean temperature ranges between 39° and 43° Fahr.

In 1897 the nobility, mostly of German descent, owned and farmed 52% of the land; 42% was farmed, but not owned, by the peasants, mostly Esths or Esths, and only 3% was owned by persons outside the ranks of the nobility. Since then one-fourth of the peasantry have been enabled to purchase their holdings, more than half a million acres having passed into their possession. Agriculture is the chief occupation, and it is, on all the larger holdings, carried on with greater scientific knowledge than in any other part of Russia. A total of 66,292 (16,000) is under cultivation; meadows and grass-lands account for 47% of the total area; and forests cover 19%. The principal crops are rye, oats, barley and potatoes, with large quantities of vegetables. Cattle-breeding flourishes, and meat and butter are constantly increasing items of export. The manufactories consist chiefly of distilleries (over 13,500,000 gallons annually), cotton (at Krāhölm falls on the Narova), woollen, flour, paper and saw mills, iron and machinery works, and match factories. Fishing is active along the coast, especially for anchovies. The province is intersected by a railway running from St. Petersburg to Reval, with branches from the latter city westwards to Baltic Port and southwards to Livonia, and from Taps south to Yurev (Dorpat). The chief seaports are Reval, Baltic Port, Hapsal, Kunda and Dagö. Estonia is divided into four districts, the chief towns of which are Reval (pop. in 1897, 66,292), the capital of the province; Hapsal, a lively watering-place (438); Weissenstein (2509); and Wesenberg (3500).

The population, which consists chiefly of Esths (365,099 in 1897), Russians (18,624), Germans (6,426), and Finns (11,000) has been growing fairly fast: in 1870 it numbered 323,060, and in 1897 413,747, of whom 210,199 were women and 76,155 lived in towns; in 1906 it was estimated at 451,700. Ninety-six per cent. of the whole belong to the Lutheran Church. Education is, for Russia, relatively high.

The Esths, Esths or Esthians, who call themselves Tallapoog and Maamets, are known to the Russians as Chukhni or Chukhontsi, to the Letts as Iggaini, and to the Finns as Virolaiset. They belong to the Finnish family, and consequently to the Ural-Altaic division of the human race. Altogether they number close upon one million, and are thus distributed: 365,099 in Estonia (in 1897), 518,594 in Livonia, 4,116 in the government of St. Petersburg, 25,438 in that of Pskov, and 12,855 in other parts of Russia. As a race they exhibit manifest evidences of their Ural-Altaic or Mongolic descent in their short stature, absence of beard, oblique eyes, broad face, low forehead and small mouth. In addition to that they are an under-sized, ill-thriven people, with long arms and thin, short legs. They cling tenaciously to their native language which is closely allied to the Finns, and is divisible into two, or according to some authorities into three, principal dialects—Dorpat Esthonian and Reval Esthonian, with Pernau Esthonian. Reval Esthonian, which preserves more carefully the full inflectional forms and pays greater attention to the laws of euphony, is recognized as the literary language. Since 1873 the cultivation of their mother-tongue has been sedulously promoted by an Estonian Literary Society (Eesti Korrjameste Selts), which publishes Toimesused, or "Instructions" in all sorts of subjects. They have a decided love of poetry, and exhibit great facility in improvising verses and poems on all occasions, and they sing, everywhere, from morning to night. Like the Finns they possess rich stores of national songs. These, which bear an unmistakable family likeness to those of the great Finnish epic of the Kalevala, were collected as the Kalevi Poëg, and edited by Kreutzwald (1857), and translated into German by Reithal (1852-1859) and Bertram (1861) and by Löwe (1900). Other collections of Esthische Volkslieder have been published by Neuss (1850-1852) and Kreutzal und Neuss (1854); while Kreutzwald (1866) and Jannsen (1888) have published collections of legends and national tales. The earliest publication in Estonian was a Lutheran catechism in the 16th century. An Estonian translation of the New Testament was printed at Reval in 1715. Between 1813 and 1832 there appeared at Pernau twenty volumes of Beiträge zur genauer Kenntnis der estnischen Sprache, by Rosenplanter, and from 1840 onwards many valuable papers on Estonian subjects were contributed to the Verhandlungen der gelehrten estnischen Gesellschaft zu Dorpat. F. J. Wiedemann, who laboured indefatigably in the registration and preservation of matters connected with Estonian language and lore, published an Estnisch-deutsches Wörterbuch (1865; 2nd ed. by Hurt, 1891, &c.), and in 1903 there appeared at Reval a Deutsch-estnisches Wörterbuch, by Plooompun and Kann.

The Estonians have been, since the time of Boleslaus in 1234, a warlike and predatory race, the terror of the Baltic sea-men in consequence of their piracies. More than one of the Danish kings made serious attempts to subdue them. Canute VI. invaded their country (1194-1196) and forced baptism upon many of them, but no sooner did his war-ships disappear than they reverted to their former heathenism. In 1219 Waldemar II. undertook a more formidable crusade against them, in the course of which he founded the town and episcopal see of Reval. By his efforts the northern portion of the race were made submissive to the Danish crown; but, though conquered, they were by no means subdued, and were incessantly in revolt, until, after a great rebellion in 1344, Waldemar IV. Atterdag sold for 19,000 marks his portion of Estonia in 1346, to the order of the Knights of the Sword. These German crusaders had already, after a quarter of a century's fighting, in 1224 gained possession of the regions inhabited by the southern portion of the race, that is those now included in Livonia. From that time for nearly six hundred years or more the Estonians were practically reduced to a state of servile subjection to the Germans.

In 1521 the nobles and cities of Estonia voluntarily placed themselves under the protection of the crown of Sweden; but after the wars of Charles XII., Estonia was formally ceded to his victorious rival, Peter the Great, by the peace of Nystad (1721). Serfdom was abolished in 1817 by Tsar Alexander I.; but the condition of the peasants was so little improved that they rose in open revolt in 1859. Since 1878, however, a vast change for the better has been effected in their economic position (see above). The determining feature of their recent history has been the attempt made by the Russian government (since 1881) and the Orthodox Greek Church (since 1893) to russify and convert the inhabitants of the province, Germans and Esths alike, by enforcing the use of Russian in the schools and by harsh and repressive measures aimed at their native language.

Kruse, Urgeschichte des estnischen Volksstammes (1846); Wiedemann, Grammatik der estnischen Sprache (1875), and Aus dem inneren und äusseren Leben der Esthen (1876); Köppen, Geschichte Esthlands (1847); F. Müller, Beiträge zur Germanistik und Hydrographie von Estland (1869-1871); Bunge, Das Herzogtum Estland unter den Konigen von Dänemark (1877); and Sera- phim, Geschichte Esth.-, Est., and Kuriards (2nd ed., 1879) and various papers in the Pinnich-Ugrische Forschungen.

(P. A. K.; J. T. Be.; C. El.)

ESTIENNE (or ÉTIENNE; the French form of the name; anglicized to Stephens, and latinized to Stephanus), a French family of scholars and printers.

The founder of the race was HENRI ESTIENNE (d. 1520), the scion of a noble family of Provence, who came to Paris in 1502, and soon afterwards set up a printing establishment at the top of the rue Saint-Jean de Beavais, on the hill of Saint-Geneviève opposite the law school. He died in 1520, and, his three sons
being minors, the business was carried on by his foreman Simon de Colines, who in 1521 married his widow.

Robert Estienne (1503–1559) was Henri’s second son. After his father’s death he acted as assistant to his stepfather, and in this capacity superintended the printing of a Latin edition of the New Testament in 16mo (1553). Some slight alterations which he had introduced into the text brought upon him the censures of the faculty of theology. It was the first of a long series of disputes between him and that body. It appears that he had intimate relations with the new Evangelical preachers almost from the beginning of the movement, and that soon after this time he definitely joined the Reformed Church. In 1526 he entered into possession of his father’s printing establishment, and adopted as his device the celebrated olive-tree (a reminiscence, no doubt, of his grandmother’s family of Montolivet), with the motto from the epistle to the Romans (xii. 20), Noli altum sapere, sometimes with the addition sed time. In 1528 he married Perrette, a daughter of the scholar and printer Josse Bade (Jodocus Badius), and in the same year he published his first Latin Bible, an edition in folio, upon which he had been at work for the last four years. In 1532 appeared his Thesaurus linguae Latinae, a dictionary of Latin words and phrases, upon which for two years he had toiled incessantly, with no other assistance than that of Thierry of Beauvais. A second edition, greatly enlarged and improved, appeared in 1536, and a third, still further improved, in 3 vols. folio, in 1543. Though the Thesaurus is now superseded, its merits must not be forgotten. It was vastly superior to anything of the kind that had appeared before; it formed the basis of future labours, and even as late as 1734 was considered worthy of being re-edited. In 1539 Robert was appointed king’s printer for Hebrew and Latin, an office to which, after the death of Conrad Neobar in 1540, he united that of king’s printer for Greek. In 1541 he was entrusted by Francis I. with the task of procuring from Claude Garamond, the engraver and type-founder, three sets of Greek type for the royal press. The middle size were the first ready, and with these Robert printed the editio princeps of the Ecclesiasticae historiae Eusebii and others (1544). The smallest size were first used for the 16mo edition of the New Testament known as the O mirificam (1546), while with the largest size was printed the magnificent folio of 1550. This edition involved the printer in fresh disputes with the faculty of theology, and towards the end of the following year he left his native town for ever, and took refuge at Geneva, where he published in 1552 a cautious and effective answer to his persecutors under the title Ad censuras theologorum Parisiensem, quius Bibliam a R. Stephano, Typographo Regio, ex usq. calumnios notaturum, iudaeum R. responsio. A French translation, which is remarkable for the excellence of its style, was published by him in the same year (printed in Renuard’s Annales de l’imprimerie des Estiennes). At Geneva Robert proved himself an ardent partisan of Calvin, several of whose works he published. He died there on the 7th of September 1559.

It is by his connection with the Bible, and especially as an editor of the New Testament, that he is on the whole best known. The text of his New Testament of 1550, either in its original form or in such slightly modified form as it assumed in the Elzevir text of 1634, remains to this day the traditional text. But this is due rather to his own efforts than to the criticisms of critical and textual scholars. The only important readings of the fifteen MSS. which Robert’s son Henri had collated for the purpose were merely introduced into the margin. The text was still almost exactly that of Erasmus. It was, however, the first edition of the New Testament in a critical and textual sense. For almost all the copies of the whole Bible Robert printed eleven editions—eight in Latin, two in Hebrew and one in French; while of the New Testament alone he printed twelve—five in Greek, five in Latin and two in French. In the case of the New Testament of 1551 (printed at Geneva) the present division into verses was introduced. The principles which issued from Robert’s press were eight in number, viz. Eusebii, including the Praeparatio evangelica and the Demonstration of the Old Testament as well as the Historia ecclesiastica already mentioned (1544–1546), Mosopothus (1545), Dionysius of Halicarnassus (February 1547), Alexander Trallianus (January 1548), Dio Cassius (January 1548), Justin Martyr (1551), Xiphilinus (1551), Appian (1551), the last being completed, after Robert’s departure from Paris, by his brother Charles, and appearing under his name. These editions, all in folio, except the Mosopothus, which is in 4to, are unrivalled for beauty. Robert also printed numerous editions of Latin classics, of which perhaps the folio Virgil of 1532 is the most noteworthy, and a large quantity of Latin grammars and other classical works, many of which were written by Maturin Cordier, his friend and co-worker in the cause of humanism.

Charles Estienne (1504 or 1505–1564), the third son of Henri, was, like his brother Robert, a man of considerable learning. After the usual humanistic training he studied medicine, and took his doctor’s degree at Paris. He was for a time tutor to Jean Antoine de Bafi, the future poet. In 1551, when Robert Estienne left Paris for Geneva, Charles, who had remained a Catholic, took charge of his printing establishment, and in the same year was appointed king’s printer. In 1561 he became bankrupt, and he is said to have died in a debtors’ prison.

His principal works are Praedium Rusticum (1554), a collection of tracts which he had compiled from ancient writers on various branches of agriculture, and which continued to be a favourite book down to the end of the 17th century; Dictionarium historicum ac poeticum (1553), the first French encyclopedia; Theaurus Geronianus (1557), and De dissectione partium corporis humani libri tres, with well-drawn woodcuts (1548). He also published a translation of the works of Pliny, and in 1553 appeared the title of Le Sacrifice (1543; republished as Les Absoues, 1549), which had some influence on the development of French comedy; and Paradoxes (1553), an imitation of the Paradosi of Ortensio Landi.

Henri Estienne (1531–1598), sometimes called Henri II., was the eldest son of Robert. In the preface to his edition of Aulus Gellius (1585), addressed to his son Paul, he gives an interesting account of his father’s household, in which, owing to the various nationalities of those who were employed on the press, Latin was used as a common language. Henri thus picked up Latin as a child, but by his own request he was allowed to learn Greek as a serious study before Latin. At the age of fifteen he became a pupil of Pierre Danès, at that time the first Greek scholar in France. Two years later he began to attend the lectures of Jacques Toussain, one of the royal professors of Greek, and in the same year (1545) was employed by his father to collate a MS. of Dionysius of Halicarnassus. In 1547 he went to Italy, where he spent three years in hunting for and collating MSS. and in intercourse with learned men. In 1550 he visited England, where he was favourably received by Edward VI., and then Flanders, where he learnt Spanish. In 1551 he joined his father at Geneva, which henceforth became his home. In 1554 he gave to the world, as the firstfruits of his researches, two first editions, viz. a tract of Dionysius of Halicarnassus and the so-called “Anacreon.” In 1556 he discovered at Rome ten new books (xi.–xx.) of Diodorus Siculus. In 1557 he issued from the press which in the previous year he had set up at Geneva three first editions, viz. Athenagoras, Maximus Tyrius, and some fragments of Greek historians, including Appian’s Aeneid, and Ἡρακλῆς and an edition of Aeschylus, in which for the first time the Agamemnon was printed in entirety and as a separate play. In 1559 he printed a Latin translation, under the pen of Sextus Empiricus, and an edition of Diodorus Siculus with the new books. In 1559 his father dying in the same year, he became under his will owner of his press and property, however, to the condition of keeping it at Geneva. In 1566 he published his best-known French work, the Apologie pour Hernode, or, as he himself called it, L’Introduction au traité de la conformité des merveilles anciennes avec les modernes ou Traité préparatif à l’Apologie pour Hernode. Some passages being considered objectionable by the Geneva consistory, he was compelled to cancel the pages containing them. The book became highly popular, and within sixteen years twelve editions were printed. In 1572 he published the great work upon which he had been labouring for many years, the Thesaurus Graecae linguae, in 5 vols. fol. The publication in 1578 of his Deux Dialogues du nouveau français italiéné brought him into a fresh dispute with the consistory. To avoid their censure he went to Paris, and resided at the French court for a year. On his return to Geneva he was summoned before the consistory, and, proving contumacious, was imprisoned for a week. From this time his life became more and more of a nomad one. He is to be found
at Basel, Heidelberg, Vienna, Pest, everywhere but at Geneva, these journeys being undertaken partly in the hope of procuring native publications for the lens and partly in the hope of the
on such publications as the Thesaurus and the Plato of 1578 had
almost ruined him. His press stood nearly at a standstill.
A few editions of classical authors were brought out, but each
successive one showed a falling off. Such value as the later
ones had was chiefly due to the notes furnished by Casaubon,
who in 1586 had married his daughter Florence. His last years
were marked by ever-increasing infirmity of mind and temper.
In 1597 he left Geneva for the last time. After visiting Mont-
peller, where Casaubon was now professor, he started for Paris,
but was seized with sudden illness at Lyons, and died there at the
end of January 1598.

Few men have ever served the cause of learning more devotedly.
For over thirty years the amount which he produced, whether as
printer, editor or original writer, was enormous. The produc-
tions of his press, though printed with the same beautiful type as his
father’s books, are, owing to the poorness of the paper and ink,
inferior to them in general beauty. The best, perhaps, from a
typeographic point of view, are the editions of Homer, the Iliad
(1566), the Iliad (1576), and the Iliad (3 vols. folio, 1578).
It was rather his scholarship which gave value to his editions.
He was not only his own press-corretor but his own editor. Thus
by the Thesaurus, the Poetics, and the Plutarch, he made
early important Greek and Latin authors that we now possess been
of his untiring activity still found some gleamings. Eighteen first
editions of Greek authors and one of a Latin author are due to
his press. The most important have been already mentioned.
Cassubon’s reputation as a printer has increased of late years. His
familiarity with the Greek language has always been admitted to
have been quite exceptional; but he has been accused of want of
taste and judgment, of carelessness and rashness. Special censure
has been hurled at him because of the metrical Thesaurus. Cassubon
has reduced conjectures of his own into the text, while pretending
to have derived them from MS. authority. But a late editor, Sintenis,
has shown, that though, as all the other editors of his day did not
pretend to original conjectures, every one of his supposed
conjectures can be traced to some MS. Whatever may be said
as to his taste or his judgment, it seems that he was both careful
and scrupulous, and that he only resorted to conjecture when
authoritative evidence did not warrant his adoption.

In any case he was at any rate the first to show what conjecture could do
towards restoring a hopelessly corrupt passage. The work, however,
on which his fame as a scholar is most surely based is the Thesaurus
Græcæ et Latinæ linguae. In this work Cassubon has given the
biggest possible weight to the service of scholarship and to which in those early days of Greek learning he has
been produced by no one but a giant. Two editions of the
Thesaurus were published in the 15th century—first at
London by Valpy (1815—1820) and last at Paris by Dibot (1851—53).

It is the labors of Henri Estienne, that, while nearly all the
French scholars who preceded him, he did not neglect his own
language, the Traité de la conformité du langage français avec le
Greco (published in 1565, but without date; ed. L. Fontegre, 1580).
French in his evident relish for sound models. The style, like the
chiefness, is elegant and firm. Though it bears evident traces of hurry, it is like that of all Henri Estienne’s French writings, clear, easy and vigorous,
uniting the directness and sensuousness of the older writers with a
superness and logical precision which at this time were almost
new elements in French prose. An edition of the Apologie has
recently been published by Liseux (ed. Restelhuber, 2 vols., 1879),
but the editor has confined himself only to the original uncorrected
edition which are known to exist. The very remarkable
encyclopedic compilation entitled Discours merveilleux de la vie et actions et déportements de
Catherine de Médicis, which appeared in 1574, has been ascribed
to Estienne but the evidence both internal and external is conclusive
against his being the author of it. Of his Latin writings the most
worthy of notice is the De Latiniate falsa suspecta (1576), the
Pseudo-Ciceron (1577) and the Nitzoldiadactus (1578), all three
written against the Ciceronians, and the Francodurienne Empirion
(1580) on the Frankfort fair (reprinted with a French
translation by Liseux, 1875). He also wrote a large quantity of
indifferent Latin verses, including a very fine poem entitled Musa
maturix Principum (Basel, 1590).

The primary authorities of account of the Estiennes are their
own works. In the garrulous and egotistical prefaces which
Henri was in the habit of prefixing to his editions will be found a
number of scattered biographical notes. Twenty-seven letters from Henri
and, in some cases, letters to his contergents have been printed,
and there is one of Robert’s in Herrinjard’s Correspondence des
Réformateurs dans le pays de langue française (9 vols. published
1866—1897), while a few other contemporary references to him
will be found in the same work. In addition the secondary authorities are
Jansen von Almedovex, De vita Stephanonis (1683),
Maittaire, Stephanon hatoria (London, 1709), A. A. Renouard,
Annales de l’imprimerie des Estienne (2nd ed., Paris, 1845); the
works of J. L. F. F. Didot in the Nouv. Biog. gén.; M. Pattison,
Essays, i. 67 ff. (1859); and Browett’s E. B. and son
ouvrage français (Paris, 1899). There is a good account of Henri’s
Thesaurus in the Quart. Rev. for January 1820, written by Bishop
Blomfield.

(A. A. T.)

ESTON, an urban district in the Cleveland parliamentary division of the North Riding of Yorkshire, England, 4 m. S.E. of Middlesbrough, on a branch of the North Eastern railway.

Pop. (1901) 11,199. This is one of the principal centres from
which the great ironstone deposits of the Cleveland Hills are
worked, and there are extensive blast-furnaces, iron-foundries
and steam sawing-mills in the district. Immediately W. of
Eston lies the urban district of Ormesby (pop. 9482), and the
whole district is densely populated (see MIDDLESBROUGH).

Marton, west of Ormesby, was the birthplace of Captain Cook
(1728).

Numerous early earthworks fringe the hills to the south.

ESTOPPEL (from O. Fr. estoper, to stop, bar; estoupe, mod.
étoupe, a plug of tow; Lat. stupe), a rule in the law of evidence
by which a party in litigation is prohibited from asserting or
denying something, when such assertion or denial would be
inconsistent with previous admissions or statements or conduct.

Estoppel is said to arise in three ways: (1) by word or deed, or
judgment, (2) by deed, and (3) by matter in pais or conduct.

(1) Where a cause of action has been tried and final judgment
has been pronounced, the judgment is conclusive—either party
attempting to renew the litigation by a new action would be
stopped by the judgment. “Every judgment is conclusive proof as against parties and privies, of facts directly in issue in the
case, actually decided by the court, and appearing from the judgment itself to be the ground on which it was based.”—
Stephen’s Digest of the Law of Evidence, Art. 41. (2) It is one of the
privileges of deeds as distinguished from simple contracts
that they operate by way of estoppel. “A man shall always be
stopped by his own deed, or not permitted to aver or prove anything in contradiction to what he has once so solemnly and
deliberately avowed” (Blackstone, 2 Com. 205; e.g. where a
bond recited that the defendants were authorized by acts of
parliament to borrow money, and that under such authority they
borrowed money from a certain person, they were estopped from
saying that they did not in fact so borrow money, as stated by
the bond. (3) Estoppel by conduct, or, as it is sometimes called, estoppel by later in pais, is the
most important head. The rule practically comes to this that,
when in a person in his dealings with others has acted so as to
induce them to believe a thing to be true and to act on such belief,
he may not in any proceeding between himself and them deny
the thing to be true: e.g. a partner retiring from a firm without
giving notice to the customers, cannot, as against a customer
having no knowledge of his retirement, deny that he is a partner,
As between landlord and tenant the principle operates to prevent the denial by the tenant of the landlord's title. So if a person comes upon land by the licence of the person in possession, he cannot deny that the licensor had a title to the possession at the time the licence was given. Again, if a man gives a bill of exchange, he may not deny the signature or the capacity of the drawer. So a person receiving goods as bailee from another cannot deny the title of that other to the goods at the time they were entrusted to him.

Estoppel of whatever kind is subject to one general rule, that it cannot override the law of the land; for example, a corporation would not be estopped as to acts which are ultra vires.

ESTOUTEVILLE, GUILLAUME D' (1403-1483), French ecclesiastic, was bishop of Angers, of Digne, of Porto and Santa Rufina, of Ostia and Velletri, archbishop of Rouen, prior of Saint Martin des Champs, abbot of Mont St Michel, of St Ouen at Rouen, and of Montaubon. He was sent to France as legate by Pope Nicholas V. to make peace between Charles VII. and England (1451), and undertook, ex officio, the revision of the trial of Joan of Arc; he afterwards reformed the statutes of the university of Paris. He then went to preside over the assembly of clergy which met at Bourges to discuss the observation of the Pragmatic Sanction (see BASIL, COUNCIL OF), finally returning to Rome, where he passed almost all the rest of his life. He was a great builder, Rouen, Mont St Michel, Pontoise and Gaillon owing many noble buildings to his initiative.

ESTOVERS (from the O. Fr. estover, estover, a verb used as a substantive in the sense of which is necessary; the word is of disputed origin; it has been referred to the Lat. stare, to stand, or studere, to desire), a term, in English law, for the wood which a tenant for life or years may take from the land he holds for repair of his house, the implements of husbandry, and the hedges and fences, and for firewood. The O. Eng. word for estover was bote or boot (literally meaning “good,” “profit,” the same word as seen in “better”). The various kinds of estovers were thus known as house-bote, cart or plough-bote, hedge or hay-bote, and fire-bote respectively. These rights may, of course, be restricted by express covenants. Copyholders have similar rights over the land they occupy and over the waste of the manor, in which case the rights are known as “Commons of estovers.” (See Commons.)

ESTRADA, LA, a town of north-western Spain, in the province of Pontevedra, 15 m. S. by E. of Santiago de Compostela. Pop. (1900) 23,916. La Estrada is the chief town of a densely-populated mountainous district; its industries are agriculture, stock-breeding, and the manufacture of linen and woollen cloth. Timber from the mountain forests is conveyed from La Estrada to the river Ulla, 4 m. N., and thence floated down to the seaports on Arosa Bay. The nearest railway-station is Requeijo, 7 m. W., on the Pontevedra-Santiago railway. There are mineral springs at La Estrada and at Caldas de Reyes, 17 m. W.S.W.

ESTRADA, a French architectural term for a raised platform (see Dais). In the Levant the estrade of a divan is called Sophia (Blondel), from which comes our “sofa.”

ESTRAGES, GODEFROI, COMTE D' (1607-1656), French diplomatist and marshal, was born at Agen. He was the son of François d'Estrades (d. 1653), a partisan of Henry IV., and brother of Jean d'Estrades, bishop of Comdom. He became a page to Louis XIII., and at the age of nineteen was sent on a mission to Maurice of Holland. In 1646 he was named ambassador extraordinary to Holland, and took part in the conferences at Münster. Sent in 1661 to England, he obtained in 1662 the restitution of Dunkirk. In 1667 he negotiated the treaty of Breda with the king of Denmark, and in 1678 the treaty of Nijmegen, which ended the war with Holland. Independently of these diplomatic missions, he took part in the principal campaigns of Louis XIV., in Italy (1648), in Catalonia (1653), in Holland (1672); and was created marshal of France in 1675. He left Lettres, mémoires et négociations en qualité d'ambassadeur en Hollande depuis 1603 jusqu' en 1668, of which the first edition in 1709 was followed by a nine-volume edition (London (the Hague), 1743).

The sons of Godefroi d'Estrades, Jean François d'Estrades was ambassador to Venice and Piedmont; Louis, marquis d'Estrades (d. 1711), succeeded his father as governor of Dunkirk, and was the father of Godefroi Louis, comte d'Estrades, lieutenant-general, who was killed at the siege of Belgrade, 1717.

See Felix Salmon, Frankreichs Beziehungen zu dem scotoischen Aufstand (1637-1649), containing an excursus on the falsification of the letters of the comte d'Estrades; Philippe Launau, Le Maréchal d'Estrades (Agen, 1896).

ESTREAT (O. Fr. estrait, Lat. extracuta), originally, a true copy or duplicate of some original writing or record; now used only with reference to the enforcement of a forfeited recognizance. At one time it was the practice to extract and certify into the eschequer copies of entries in court rolls which contained provisions or orders in favour of the treasury, hence the estreating of a recognizance was the taking out from among the other records of the court in which it was filed and sending it to the eschequer to be enforced, or sending it to the sheriff to be levied by him, and then returned by the clerk of the peace to the lords of the treasury. (See Recognizance.)

ESTRÉES, GABRIELLE D' (1573-1599), mistress of Henry IV. of France, was the daughter of Antoine d'Estrées, marquis of Céroux, and Françoise Babou de la Bourdaisière. Henry IV., who in November 1590 stayed at the castle of Céroux, became violently enamoured of her. Her father, anxious to save his daughter from so perilous an entanglement, married her to Nicholas d'Amerval, seigneur de Liencourt, but the union proved unhappy, and in December 1592, Gabrielle, whose affection for the king was sincere, became his mistress. She lived with him from December 1592 onwards, and bore him several children, who were recognized and legitimized by him. She possessed the king's entire confidence; he willingly listened to her advice, and created her marchioness of Monceaux, duchess of Beaufort (1597) and Étampes (1598), a peeress of France. The king even proposed to marry her in the event of the success of his suit for the abdication of the Holy See of his marriage with Margaret of Valois; but before the question was settled Gabrielle died, on the 10th of April 1599. Poison was of course suspected; but her death was really caused by puerperal convulsions (eclampsia).

See Adrien Desclozeaux, Gabrielle d'Estrées, Marquise de Monceaux, etc. (Paris, 1889).

ESTREMADURA, or Extremadura, an ancient territorial division of central and western Portugal, and of western Spain; comprising the modern districts of Leiria, Santarem and Lisbon, in Portugal, and the modern provinces of Badajoz and Cáceres in Spain. Pop. (1900) 2,093,818; area, 23,025 sq. m. The name of Extremadura appears to be of early Romance or Late Latin origin, and probably was applied to all the far western lands (extrema oria) bordering upon the lower Tagus, as far as the Atlantic Ocean, and thus equivalent to Land's End, or Finistère. In popular speech it is more commonly used as the names of the modern divisions mentioned above, which were created in the 19th century. As, however, there are many racial, economic and historic differences between Portuguese and Spanish Extremadura, the two provinces are separately described below.

1. Portuguese Extremadura is bounded on the N. by Beira, E. and S. by Alentejo, and W. by the Atlantic Ocean. Pop. (1900) 1,221,418; area, 6,937 sq. m. The greatest length of the province, from N. to S., is 165 m.; its greatest breadth, from E. to W., is 72 m. The general uniformity of the coast-line is broken by the broad and deep estuaries of the Tagus and the Sado, and by the four conspicuous promontories of Cape Carvoeiro, Cape da Roca, Cape Espichel and Cape de Sines. The Tagus is the great navigable waterway of Portuguese Extremadura, flowing from north-east to south-west, and fed by many minor tributaries, notably the Zêzere on the right and the Zatas on the left. It divides the country into two nearly equal portions, wholly dissimilar in surface and character. South of the Tagus the land is almost everywhere low, flat and monotonous, while in several places it is rendered unhealthy by undrained marshes.
Sado, which issues into Setubal Bay, is the only important river of this region. North of the Tagus, and parallel with its right bank, extends the mountain chain which is known at its northern extremity as the Serra do Aire and, where it terminates above Cape da Roca, as the Serra da Cintura. This ridge, which is buttressed on all sides by lesser groups of hills, and includes part of the famous lines of Torres Vedras (q.v.), exceeds 2200 ft. in height, and constitutes the watershed between the right-hand tributaries of the Tagus and the Líz, Sizandro and other small rivers which flow into the Atlantic. On its seaward side, except for the line of sheer and lofty cliffs between Cape Carvoeiro and Cape da Rota, the country is mostly flat and sandy, with extensive heaths and pine forests; but along the fertile and well-cultivated right bank of the Tagus the river scenery, with its terraced hills of vines, olives and fruit trees, often resembles that of the Rhine in Germany. The natural resources of Portuguese Estremadura, with its inhabitants, industries, commerce, communications, &c., are described under Portugal; for on such matters there is little to be said of this central and most characteristic province which does not apply to the whole kingdom. Separate articles are also devoted to Lisbon, the capital, and Abrantes, Cinta, Leiria, Mafra, Santarem, Setubal, Tomar, Torres Novas and Torres Vedras, the other chief towns. The women of Peniche, a small fishing village on the promontory of Cape Carvoeiro, have long been celebrated throughout Portugal for their skill in the manufacture of fine lace.

2. Spanish Estremadura is bounded on the N. by Leon and Old Castile, E. by New Castile, S. by Andalusia, and W. by the Portuguese province of Beira and Alemtejo, which separate it from Portuguese Estremadura. Pop. (1900) 882,410; area, 16,118 sq. m. Spanish Estremadura consists of a tableland separated from Leon and Old Castile by the lofty Sierra de Gredos, the plateau of Béjar and the Sierra de Gata, which form an almost continuous barrier along the northern frontier, with its summits ranging from 6000 to more than 8000 ft. in altitude. On the south the comparatively low range of the Sierra Morena constitutes the frontier of Andalusia; on the east and west there is a still more gradual transition to the plateau of New Castile and the central plains of Portugal. The tableland of Spanish Estremadura is itself bisected from east to west by a line of mountains, the Sierras of San Pedro, Montanchez and Guadalupe (4000-6000 ft.), which separate its northern half, drained by the river Tagus, from its southern half, drained by the Guadiana. These two halves are respectively known as Alta or Upper Estremadura (the modern Cáceres), and Baja or Lower Estremadura (the modern Badajoz). The Tagus and Guadiana flow from north to west through a monotonous country, level or slightly undulating, often almost uninhabited, and covered with a thin growth of shrubs and grass. Perhaps the most characteristic feature of this tableland is the vast heaths of gum-cistus, which in spring colour the whole landscape with leagues of yellow blossom, and in summer change to a brown and arid wilderness.

The climate in summer is hot but unhealthy, except in the swamps which occur along the Guadiana. The rainfall is scanty; dew, however, is abundant and the nights are cool. Although the high mountains are covered with snow in November, the winters are not usually severe. The soil is naturally fertile, but drought, floods and locusts render agriculture difficult, and sheep-farming is the most important of Estremaduran industries. (See Spain: Agriculture.) In the 10th century, however, this industry lost much of its former importance owing to foreign competition.

Immense herds of swine are bred and constitute a great source of support to the inhabitants, not only supplying them with food, but also forming a great article of export to other provinces—the pork, bacon and hams being in high esteem. The beech, oak and chestnut woods afford an abundance of food for swine, and there are numerous plantations of olive, cork and fruit trees, but a far greater area of forest has been destroyed. For an account of commerce, mining, communications, &c., in Spanish Estremadura, with a list of the chief towns, see Cáceres and Badajoz. In character and physical type, the people of this region are less easily classified than those of other Spanish provinces. They lack the stamina, the breadth of mind, the independent and enterprising spirit of the Asturians, Basques and Catalans, the culture of the Castilians and Andaluscians. Their failure to develop a distinctive local type of character and civilization is perhaps due to the adverse economic history of their country. The two great waterways which form the natural outlet for Estremaduran commerce flow to the Atlantic through a foreign and, for centuries, a hostile territory. Like other parts of Spain, Estremadura suffered severely from the expulsion of the Jews and Moors (1492-1610), while the compensating treasure, derived during the same period from Spanish America, never reached a province so remote at once from the sea and from the chief centres of national life. Although Cortes (1485-1547), the conqueror of Mexico and Pizarro (c. 1471-1541), the conqueror of Peru, were both born in Estremadura, their exploits, far from bringing prosperity to their native province, only encouraged the emigration of its best inhabitants. Heavy taxation and harsh land-laws prevented any recovery, while the felling of the forests reduced many fertile areas to waste land, and rendered worse a climate already unfavourable to agriculture. Few countries leave upon the mind of the traveller a deeper impression of intense poverty.

ESTREMOZ, a town of Portugal, in the district of Évora, formerly included in the province of Alentejo; 104 m. by rail E. of Lisbon, on the Casa Branca-Evora-Elvas railway. Pop. (1900) 7920. Estremoz is built at the base of a hill crowned by a large dismantled citadel; its fortifications, which in the 17th century accommodated 20,000 troops and rendered the town one of the principal defences of the frontier, are now obsolete. There are marble quarries in the neighbourhood, and the Estremoz bíbas, red earthenware jars, are used throughout Portugal as water-holders and exported to Spain. At Ameixial (1188) and Montes Claros, near Estremoz, the Spanish were severely defeated by the Portuguese in 1663 and 1665. Villa Viçosa (3841), 10 m. S.E., is a town of pre-Roman origin, containing a royal palace. The altars with Latin inscriptions to the Iberian god Endovellicus, found at Villa Viçosa, are preserved in the museum of the Royal Academy of Sciences, Lisbon.

ESTUARY (from the Lat. ostiaariurn, a place reached by aetis, the tide), an arm of the sea narrowing inwards at the mouth of a river where sea and fresh water meet and are mixed, i.e. the tidal portion of a river's mouth. Structurally the estuary may represent the long-continued action of river erosion and tidal erosion confined to a narrow channel, most effective where the channel is flanked by impassable cliffs or by the drowned portion of the lower part of a river-valley. In a map of Britain showing sea-depths it will be observed that under the Severn estuary the sea deepens in a number of steps descending by concentric Va's that become blunter towards deep water until the last is a mere indentation pointing towards the long narrow termination of the present estuary. In this and in similar cases the progress of the estuary is indicated upon what is now the continental shelf. The chief interest in estuarine conditions is the mingling of sea and fresh water. Where, as in the Severn and the Thames, the fresh water meets the sea gradually the water is mixed, and there is very little change in salinity at high tide. The fresh water flows over the salt water and there is a continuous rapid change in salinity towards the sea, for the currents sweeping in and out mix the water constantly. Where the river brings down a great quantity of fresh water in a narrow channel, the change of salinity at high and low water is very marked. "When, however, the inlet is very large compared with the river, and there is no bar at the opening, the estuarine character is only shown at the upper end. In the Firth of Forth, for example, the landward half is an estuary, but in the seaward half the water has become more thoroughly mixed, the salinity is almost uniform from surface to bottom, and increases very gradually towards the sea. The river-water meets the sea diffused uniformly through a deep mass of water scarcely fresher than the sea itself, so that the two mix uniformly, and the sea becomes slightly freshened.
throughout its whole depth for many miles from land" (H. R. Mill, *Realm of Nature*, 1807).

**ESZTERGOM** (Ger. *Gran*; Lat. *Strigoniensia*), a town of Hungary, capital of the county of the same name, 36 m. N.W. of Budapest by rail. Pop. (1900) 34,488. It is situated on the right bank of the Danube, nearly opposite the confluence of the Gran, and is divided into the town proper and three suburbs. The town is the residence of the primate of Hungary, and its cathedral, built in 1821-1829, after the model of St. Peter's at Rome, is one of the finest and largest in the country. It is picturesquely built on an elevated and commanding position, 215 ft. above the Danube, and its dome, visible from a long distance, is 260 ft. high, and has a diameter of 52 ft. The interior is very richly decorated, notably with fine frescoes, and its treasury and fine library of over 60,000 volumes are famous. Besides several other churches and two monastic houses, the principal buildings include the handsome palace of the primate, erected in 1883; the archiepiscopal library, with valuable incunabula and old MSS.; the seminary for the education of Roman Catholic priests; the residences of the chapter; and the town-hall. The population is chiefly employed in cloth-weaving, wine-making and agricultural pursuits. An iron bridge, 1664 ft. long, connects Esztergom with the market town of Párkány (pop. 28,360) on the opposite bank of the Danube.

Esztergom is one of the oldest towns of Hungary, and is famous as the birthplace of St. Stephen, the first prince crowned an apostolic king of Hungary. During the early times of the Hungarian monarchy it was the most important mercantile centre in the country, and it was the meeting-place of the diets of 1016, 1114, 1144 and 1526. It was almost completely destroyed by Tatar hordes in 1241, but was rebuilt and fortified by King Béla IV. In 1543 it fell into the hands of the Turks, from whom it was recovered, in 1505, by Carl von Mansfeld. In 1604 it reverted to the Turks, who held it till 1683, when it was regained by the united forces of John Sobieski, king of Poland, and Prince Charles of Lorraine. It was created an archbishopric in 1601. During the Turkish occupation of the town the archbishopric was removed to Tyrnau, while the archbishop himself had his residence in Pressburg. Both returned to Esztergom in 1820. In 1708 it was declared a free city by Joseph I. On the 13th of April 1818 it was partly destroyed by fire.

For numerous authorities on the see and cathedral of Esztergom see *Voyages pittoresques et historiques dans les diverses parties de la Turquie* by Tristram, vol. ii. (1831), s.v. "Gran." Of these may be mentioned especially F. Knaus, *Monumenta Ecclesiae Strigoniensis* (3 vols., Eszterg., 1874); Joseph Dankó, *Geschichtliches aus dem Graner Dombezirk* (Gran, 1880).

**ÉTAGÈRE**, a piece of light furniture very similar to the English what-not, which was extensively made in France during the latter part of the 18th century. As the name implies, it consists of a series of shelves or shelves for the reception of ornaments or other small articles. Like the what-not it was very often corner-wise in shape, and the best Louis XVI. examples in exotic woods are exceedingly graceful and elegant.

**ÉTAH**, a town and district of British India, in the Agrah division of the United Provinces. The town is situated on the Grand Trunk road. Pop. (1901) 8796. The district has an area of 1733 sq. m. The district consists for the most part of an elevated alluvial plateau, dipping down on its eastern slope into the valley of the Ganges. The uplands are irrigated by the Ganges Canal. Between the modern bed of the Ganges and its ancient channel lies a belt of fertile land, covered with a rich deposit of silt, and abundantly supplied with natural moisture. A long line of swamps and hollows still marks the former course of the river; and above it rises abruptly the original cliff which now forms the terrace of the upland plain. The Kali Nadi, a small stream flowing in a deep and narrow gorge, passes through the centre of the district, and affords an outlet for the surface drainage. Etah was at an early date the seat of a primitive Aryan civilization, and the surrounding country is mentioned by Hsüan Tsang, the Chinese Buddhist pilgrim of the 7th century A.D., as rich in temples and monasteries. But after the bloody repression of Buddhism before the 8th century, the district seems to have fallen once more into the hands of aboriginal tribes, from whom it was wrested a second time by Rajputs during the course of their great migration eastward. With the rest of upper India it passed under the sway of Mahmud of Ghazni in 1017, and thenceforth followed the fortunes of the Mahommedan empire. At the end of the 18th century it formed part of the territory over which the wazir of Oudh had made himself ruler, and it came into the possession of the British government in 1801, under the treaty of Lucknow. During the mutiny of 1857 it was the scene of serious disturbances, coupled with the usual anarchic quarrels among the native princes. In 1901 the population was 863,948, showing an increase of 23% in the decade due to the extension of canal irrigation. It is traversed by a branch of the Rajputana railway from Agra to Cawnpoor, with stations at Kasganj and Soron, which are the two largest towns. It has several printing presses, indigo factories, and factories for pressing cotton, and there is a considerable agricultural export trade.

**ÉTAMPES, ANNE DE PISSELEU D'HEILLY, DUCHESE d'** (1508-1580), mistress of Francis I. of France, daughter of Guillaume de Pisseleu, sieur d'Heilly, a nobleman of Picardy. She came to court before 1522, and was one of the maids of honour of Louise of Savoy. Francis I. made her his mistress, probably on his return from his captivity at Madrid (1526), and soon gave Madame de Châteaubriant for her. Anne was sprightly, pretty, witty and cultured, and succeeded in keeping the favour of the king till the end of the reign (1547). The liaison received some official recognition, when Queen Eleanor entered Paris (1530), the king and Anne occupied the same window. In 1533 Francis gave her in marriage to Jean de Brosse, whom he created duc d'Étampes. The influence of the duchesse d'Étampes, especially in the last years of the reign, was considerable. She upheld Admiral Chabot against the constable de Montmorency, who was supported by her rival, Diane de Poitiers, the dauphin's mistress. She was a friend to new ideas, and co-operated with the king's sister, Marguerite d'Angoulême. She used her influence to elevate and enrich her family, her uncle, Antoine Sanguin (d. 1550), being made bishop of Orleans in 1535 and a cardinal in 1539.1 The accusations made against her of having allowed herself to be won over by the emperor Charles V. and of playing the traitor in 1544 rest on no serious proof. After the death of Francis I. (1547) she was dismissed from the court by Diane de Poitiers, humiliated in every way, and died in obscurity much later, probably in the reign of Henry III.

**ÉTAMPES**, a town of northern France, capital of an arrondissement in the department of Seine-et-Oise, on the Oise railway, 35 m. S. by W. of Paris. Pop. (1906) 87,200. Étampes is a long straggling town hemmed in between the railway on the north and the Chalouette on the south; the latter is a tributary of the Juine which waters the eastern outskirts of the town. A fine view of Étampes is obtained from the Tour Guinette, a ruined keep built by Louis VI. in the 12th century on an eminence on the other side of the railway. Notre-Dame du Fort, the chief church, dates from the 13th and 14th centuries. In its plan, it is remarkable for a fine Romanesque tower and spire, and for the crenellated wall which partly surrounds it. The interior contains ancient paintings and other artistic works. St Basile (12th and 16th centuries), which preserves a Romanesque doorway, and St Martin (12th and 13th centuries), with a leaning tower of the 16th century, are of less importance. The civil buildings offer little interest, but two houses named after Anne de Pisseleu (see above), mistress of Francis I., and Diane de Poitiers, mistress of Henry II., are graceful examples of Renaissance architecture. In the square there is a statue of the naturalist, Geoffroy Saint-Hilaire, who was born in Étampes. The subprefecture, a tribunal of first instance, and a communal college are among the public institutions of Étampes. Flour-milling,

1 The château of Meudon, belonging to the Sanguin family, was handed over to the duchesse d'Étampes in 1539. Sanguin was translated to Limoges in 1546, and became archbishop of Toulouse in 1550.
metal-founding, leather-dressing, printing and the manufacture of boots and shoes and hosiery are carried on; there are quarries of paving-stone, nurseries and market gardens in the vicinity, and the town has important markets for cereals and sheep.

Étampes (Lat. Stlampe) existed at the beginning of the 7th century and in the early middle ages belonged to the crown domain. During the middle ages it was the scene of several counts de Thailes, the most notable of them being of the name in 1530 and resulted in the recognition of Innocent II. as the legitimate pope. In 1652, during the war of the Fronde it suffered severely at the hands of the royal troops under Turenne.

Lords, Counts and Dukes of Étampes.—The lordship of Étampes, in what is now the department of Seine et Oise in France, belonged to the royal domain, but was detached from it on several occasions in favour of princes, or kings' favourites. St Louis gave it to his mother Blanche of Castile, and then to his wife Marguerite of Provence. Louis, the brother of Philip the Fair, became lord of Étampes in 1317 and count in 1327; he was succeeded by his son and his grandson. Francis I. raised the countyship of Étampes to the rank of a duchy for his mistress Anne de Poitiers D’Heilly. The new duchy passed to Diane de Poitiers (1553), to Catherine of Lorraine, duchess of Montpensier (1578), to Marguerite of Valois (1582) and to Gabrielle d’Estrees (1598). The latter transmitted it to his son, César of Vendôme, and his descendants held it till 1712. It then passed by inheritance to the families of Bourbon-Conti and of Orleans.

Étampes, a town of northern France in the department of Essonne, on the right bank of the estuary of the Canche, 3 m. from the Straits of Dover, 17 m. S. of Boulogne by rail. Pop. (1896) 5136. Étampes has a small fishing and commercial port which enjoyed a certain importance during the middle ages. Boat-building is carried on. There is an old church with a statue of the Virgin much revered by the sailors. The Canche is crossed by a bridge over 1600 ft. in length. Le Touquet, in the midst of pine woods, and the neighbouring watering-place of Paris-Plage, 33 m. W. of Étampes at the mouth of the estuary, are much frequented by English and French visitors for golf, tennis and bathing, and Étampes itself is a centre for artists. Antiquarian discoveries in the vicinity of Étampes have led to the conjecture that it occupies the site of the Gallo-Roman port of Quentovicus. In 1492 a treaty was signed here between Henry VII., king of England, and Charles VIII., king of France.

ÉTAWAH, a town and district of British India, in the Agra division of the United Provinces. The town is situated on the left bank of the Jumna, and has a station on the East Indian railway, 209 m. from Allahabad. Pop. (1901) 42,576. Deep foundations with rows of strong stone arches support the towns and wide broad roads connect the higher portions by bridges and embankments. The Jama Masjid (Great Mosque) is the chief architectural ornament of Etawah. It was originally a Hindu temple, and was adapted to its present use by the Mahomedan conquerors. Several fine Hindu temples also stand about the mound on which are the ruins of the ancient fort. Etawah is now only the civil headquarters of the district, the military cantonment having been abandoned in 1861. Considerable trade is carried on by rail and river. The manufactures include cotton cloth, skin-bottles, combs and horn-ware and sweet meats.

The District of Etawah has an area of 1601 sq. m. It forms a purely artificial administrative division, stretching across the level plain of the Doab, and beyond the valley of the Jumna, to the gorges of the Chambal, and the last rocky outliers of the Vindhyan range. The district exhibits a striking variety of surface and scenery. The greater portion lies within the Doab or level alluvial plain between the Ganges and the Jumna. This part falls naturally into two sections, divided by the deep and fissured valley of the river Sengar. The tract to the north-east of that stream is rich and fertile, being watered by the Cawnpore and Etawah branches of the Ganges canal, and other important works. The south-western region has the same natural advantages, but possesses no great irrigation system, and is consequently less fruitful than the opposite slopes. Near the banks of the Jumna, the plain descends into the river valley by a series of wild ravines and terraces, inhabited only by a scattered race of hereditary herdsmen. Beyond the Jumna again a strip of British territory extends along the tangled gorges of the Chambal and the Kuari Nadi, far into the borders of the Gwalior state.

This outlying tract embraces a series of rocky gles and mountain torrents, crowned by the ruins of native strongholds, and interspersed with narrow ledges of cultivable alluvium. The climate, one of the best in the United Provinces, is cool and much less oppressive than that of the Doab, and the land is admirably adapted to agriculture. The soil, being of the loam, enriches all the crops, which are grown with great fertility in the vicinity of the towns and villages.

Etawah was marked out by its physical features as a secure retreat for the turbulent tribes of the Upper Doab, and it was not till the 12th century that any of the existing castes settled on the soil. After the Mussulman conquests of Delhi and the surrounding country, the Hindus of Etawah appear to have held their own for many generations against the Mahomedan power; but in the 16th century Baber conquered the district, with the rest of the Doab, and it remained in the hands of the Moguls until the decay of their empire. After passing through the usual vicissitudes of Mahratta and Jat conquests during the long anarchy which preceded the British rule, Etawah was annexed by the wazir of Oudh in 1773. The wazir ceded it to the East India Company in 1801, but it still remained largely in the hands of lawless native chiefs that some difficulty was experienced in reducing it to orderly government. During the mutiny of 1857 serious disturbances occurred in Etawah, and the district was occupied by the rebels from June to December; order was not totally restored till the end of 1858. In 1901 the population was 86,798, showing an increment of 28% in the decade. The district is partly watered by branches of the Ganges canal, and is traversed throughout by the main line of the East Indian railway from Cawnpore to Agra. Cotton, oilseeds and other agricultural produce are exported, and some indigo is made, but manufacturing industry is slight.

To prepare a plate for etching it is first covered with etching-ground, a composition which resists acid. The qualities of a ground are to be so adhesive that it will not quit the copper when a small quantity is left isolated between lines, yet not so adhesive that the etching point cannot easily and entirely remove it; at the same time a good ground will be hard enough to bear the hand upon it, or a sheet of paper, yet not so hard as to be brittle. The ground used by Abraham Bosse, the French painter and engraver (1602-1676) was composed as follows:—Melt 2 oz. of rosin, 1 oz. of bees-wax, and the added quantity of resinous pitch, and as little of water as possible; stir till the wax and the mastic are well mingled; then add, in the same manner, 1 oz. of bitumen in powder. There are three different ways of applying an etching-ground to a plate. The old-fashioned way was to wrap a ball of the ground in silk, heat the plate, and then rub the ball upon the surface, enough of the ground to cover the plate melting through the silk. To equalize the ground a dabber was used, which was made of cotton-wool under horseshair, the whole inclosed in silk. This method is still used by many artists, from tradition and habit, but it is far inferior in perfection and convenience to that which we will now describe. When the etching-ground is melted, add to it half its volume of essential oil of lavender, mix well, and allow the mixture to cool. You have now a paste which can be spread upon a cold plate with a roller; these rollers are covered with leather and made (very carefully) for the purpose. You first spread a little paste on a sheet of glass (if too thick, add more oil of lavender and mix with a paste knife), and roll it till the roller is quite evenly charged all over, when the paste is easily transferred to the copper, which is afterwards gently heated to expel the oil of lavender. In both these methods of grounding a plate, the work is not completed until the ground has been smoked, which is effected as follows. The plate is held by a hand-vice if a small one, or if large, is fixed at some height, with the covered side downwards. A smoking torch, composed of many thin bees-wax dips twisted
together, is then lighted and passed repeatedly under the plate in every direction, till the ground has incorporated enough lampblack to blacken it. The third way of covering a plate for etching is to apply the ground in solution as collodion is applied by photographers. The ground may be dissolved in chloriform, or in oil of lavender. The plate being ground, its back and edges are protected from the acid by Japan varnish, which soon dries, and then the drawing is traced upon it. The best way of tracing a drawing is to use sheet gelatine, which is employed as follows. The gelatine is laid upon the drawing, which its transparency allows you to see perfectly, and you trace the lines by scratching the smooth surface with a sharp point. You then fill these scratches with fine black-lead, in powder, rubbing it in with the finger, turn the tracing with its face to the plate, and rub the back of it with a burnisher. The black-lead from the scratches adheres to the etching ground and shows upon it as pale grey, much more visible than anything else you can use for tracing. Then comes the work of the etching-needle, which is merely a piece of steel sharpened more or less. J. M. W. Turner used a prong of an old steel fork which did as well as anything, but nearer etching-needles are made just like a goldsmith's or silversmith's old one, which may be thrown over the ground or cover and lays the copper bare. Some artists sharpen their needles so as to present a cutting edge which, when used sideways, scrapes away a broad line; and many etchers use needles of various degrees of sharpness to get thicker or thinner lines. It may be well to observe, in connexion with this part of the subject, that whilst thick lines agree perfectly well with the nature of woodcut, they are very apt to give an unpleasant heaviness to plate engraving of all kinds, whilst thin lines have generally a clear and agreeable appearance in plate engraving. Nevertheless, lines of moderate thickness are used effectively in etching when covered with finer shading, and very thick lines indeed were employed with good results by Turner when he intended to cover them with mezzotint (q.v.), and to print in brown ink, because their thickness was essential to prevent them from being overwhelmed by the mezzotint, and the brown ink made them print less heavily than black. Etchers differ in opinion as to whether the needle ought to scratch the copper or simply to glide upon its surface. A gliding needle is much more free, and therefore communicates a greater appearance of freedom to the etching, but it has the inconvenience that the etching-ground may not always be entirely removed, and then the lines may be defective from insufficient biting. A scratching needle, on the other hand, is free from this serious inconvenience, but it must not scratch irregularly so as to engrave lines of various depth. The biting in former times was generally done with a mixture of nitric acid and water, in equal proportions; but in the present day a Dutch mordant is a good deal used, which is composed as follows: Hydrochloric acid, 100 grammes; chlorate of potash, 20 grammes; water, 880 grammes. To make it, heat the water, add the chlorate of potash, wait till it is entirely dissolved, and then add the acid. The nitrous mordant acts rapidly and causes ebullition; the Dutch mordant acts slowly and causes no ebullition. The nitrous mordant widens the lines; the Dutch mordant bites in depth, and does not widen the lines to any perceptible degree. The time required for both depends upon temperature. A mordant bites slowly when cold, and more quickly when hot; and to obviate irregularity caused by difference of temperature, it is a good plan to heat the Dutch mordant artificially to 95° Fahr. by lamps under the bath (for which a photographer's porcelain tray is most convenient), and keep it steadily at that temperature; the results may then be counted upon; but whatever the temperature fixed upon, the results will be regular if it is regular. To get different degrees of biting on the same plate the lines which are to be pale are "stopped out" by being painted over with Japan varnish or with etching ground dissolved in oil of lavender, the darkest lines being reserved to the last, as they have to bite longest. When the acid has done its work properly the lines are bitten in such various degrees of depth that they will print with the degree of blackness required; but if some parts of the subject require to be made paler, they can be lowered by rubbing them with charcoal and olive oil, and if they have to be made deeper they can be rebitten, or covered with added shading. Rebiting is done with the roller above mentioned, which is now charged very lightly with paste and rolled over the copper with no pressure but its own weight, so as to cover the smooth surface but not fill up any of the lines. The oil of lavender is then expelled as before by gently heating the plate, but it is not smoked. The lines which require rebiting may now be rebitten, and the others preserved against the action of the acid by stopping out. These are a few of the most essential technical points in etching, but there are many matters of detail for which the reader is referred to the special works on the subject.

There are many varieties in the processes of etching, and it is only necessary here to indicate the essential facts. A brief analysis of different styles may be given.

1. Pure Line. As there is line engraving, so there is line etching; but as the etching-needle is a freer instrument than the burin, the line has qualities which differ widely from those of the burin line. Each of the two has its own charm and beauty; the liberty of the one is charming, and the restraint of the other is beautiful. For this reason it is desirable that the two should be employed together in engraving, the great masters purposely exhibit the line and do not hide it under too much shading. 2. Line and Shade. This answers exactly in etching to Mantegna's work in engraving. The most important lines are drawn first throughout, and the shade thrown over them like a wash with the brush over a pen sketch in indelible ink. 3. Shade and Texture. This is used chiefly to imitate oil-painting. Here the line (properly so called) is entirely abandoned, and the attention of the etcher is given to texture and chiaroscuro. He uses lines, of course, to express these, but does not exhibit them for their own beauty; on the contrary, he conceals them.

Of these three styles of etching the first is technically the easiest, and being also the most rapid, is adopted for sketching on the copper from nature; the second is the next in difficulty; and the third the most difficult, on account of the biting, which is never easy to manage when it becomes elaborate. The etcher has, however, many resources; he can make passages paler by burning them, or by using charcoal, or he can efface them entirely with the scraper and charcoal; he can darken them by rebiting or by regrounding the plate and adding fresh work; and he need not run the risk of biting the very palest passages of all, because these can be easily done with the dry point, which is simply a well-sharpened stylus used directly on the copper without the help of acid. It is often asserted that any one can etch who can draw, but this is a mistaken assertion likely to mislead. Without requiring so long an apprenticeship as the burin, etching is a very difficult art indeed, the two main causes of its difficulty being that the artist does not see his work properly as he proceeds, and that mistakes or misfortunes in the biting, which are of frequent occurrence to the inexperienced, may destroy all the relations of tone.

Etching, like line engraving, owed much to the old masters, but whereas, with the exception of Albert Dürer, the painters were seldom practical line engravers, they advanced etching not only by advice given to others but by the work of their own hands. Rembrandt did as much for etching as either Raphael or Rubens for line engraving; and in landscape the etchings of Claude had an influence which still continues, both Rembrandt and Claude being practical workmen in etching, and very skilful workmen. Ostade, Ruysdael, Berghem, Paul Potter, Karl Dujardin, etched as they painted, and so did a greater than any of them, Vandyck. In the earlier part of the 19th century etching was almost a defunct art, except as it was employed by engravers as a help to get faster through their work, of which "engraving" got all the credit, the public being unable to distinguish between etched lines and lines cut with the burin. But from the middle of the century dates a great revival of etching as an independent art, a revival which has extended all over Europe.

Apart from the copying of pictures by etching—which was found commercially preferable to the use of line engraving—
a number of artists and amateurs gradually practised original etching with increasing success, notably Sir Seymour Haden, J. M. Whistler, Samuel Palmer and others in England, Felix Bracquemond, C. F. Daubigny, Charles Jacque, Adolphe Appian, Maxime Lalanne, Jules Jacquemart and others on the continent, besides that singular and remarkable genius, Charles Méryon.

Etching clubs, or associations of artists for the publication of original etchings, were gradually founded in England, France, Germany and Belgium. Méryon and Whistler are two of the greatest modern etchers. Among earlier names mention may be made of Andrew Geddes (1783-1844) and of Sir David Wilkie (1785-1841). Geddes was the finer artist with the needle; he was whom Rembrandt best inspired; his work was in the grand manner. Of the rich and rare dry-points “At Peckham Rye” and “At Halliford-on-Thames,” the deepest and most brilliant master of landscape would have no need to be ashamed. David Wilkie’s prints were, naturally, not less dramatic than his pictures, but the etcher’s particular gift was possessed by him more intermittently: it is shown best in “The Receipt,” a strong and vivid, dexterous sketch, quite full of character. J. S. Cotman’s (1782-1842) etchings are also historically interesting though that artist’s special ground” for the most part. They show his qualities of elegance and freedom as a draughtsman, and much of his large dignity in the distribution of light and shade.

T. Girtin (1775-1802), in the preparations for his views of Paris, was particularly happy. The work of Sir Francis Seymour Haden (b. 1818) had a powerful influence on the art in England. Between 1858 and 1879 Seymour Haden—the first president of the Royal Society of Painter Etchers—produced the vast majority of his plates, which have always good draughtsmanship, unity of effect and a personal impression. They show a strong feeling for nature. If, amongst some two hundred subjects, they were necessary to select one or two for peculiar praise, they might be the “Breaking up of the Agamemnon,” the almost perfect “Water Meadow,” the masterly presentation of “Erith Marshes,” and the later dry-point of “Windmill Hill.” Another great etcher—Frenchman by birth, but English by long residence—is Alphonse Legros (q.v.). Great in expression and suggestive draughtsmanship, austere and economical in line, Legros’s work is the grave record of the observation and the fancy of an imaginative mind. In poetic portraiture nothing can well exceed his etched vision of G. F. Watts; “La Mort du Vagabond” is noticeable for terror and homely pathos; “Communion dans l’Eglise St Médard” is perhaps the best instance of the dignity, vigour and grave sympathy with which he addresses himself to ecclesiastical themes. Something of these latter qualities, in dealing with similar subjects, Legros passed on to his pupil, Sir Charles Holroyd (b. 1861)—an etcher in the true vein; whilst an earlier pupil, prolific as himself, as imaginative, and sometimes more deliberately uncouth—William Strang, A.R.A. (b. 1859)—carried on in his own way the tradition of that part of Legros’s practice, the preoccupation with the humble, for which Legros himself found certain warrant in a portion of the great woe of Rembrandt. Frank Short, A.R.A. (b. 1857), with the very touch of Turner, carried to completion great designs that Turner left unfinished for the Etch studiorum. The delicacy of “Sleeping till the Flood,” the curiously suggestive realism of “Wrought Nails”—a scene in the Black Country—entitle him to a lasting place in the list of the fine wielders of the etching needle. D. Y. Cameron (b. 1865) betrays the influence of Rembrandt in a noble etching, “Border Towers,” and the influence of Méryon in such a print as that of “The Palace, Stirling.” His “London Set” is particularly fine. The individuality of C. J. Watson is less marked, but his skill, chiefly in architectural work, is noticeable. Admirers of the studiously accurate portraiture of a great monument may be able to set Watson’s print of “St Etienne du Mont” by the side of Méryon’s august and mysterious and ever-memorable vision. Paul Helleu (b. 1859) in his brilliant sketches, particularly of women, has used the art of etching in a peculiarly individual and delightful way. Among the numerous other modern etchers only a bare mention can be made of Oliver Hall, Minna Bollingbrooke and Elizabeth Armstrong (Mrs Watson and Mrs Stanhope Forbes), Alfred East, Robert Macbeth, Walter Sickert, Robert Goff, Mortimer Menpes, Percy Thomas, Raven Hill, and the late Prof. H. von Herkomer, in England; in France, Roussel, J. F. Raffaelli (b. 1859), Besnard and J. J. J. Tissot (1836-1902).

The oldest treatise on etching is that of Abraham Bosse (1645). See also P. G. Hamerton, Etching and Etchers (1868), and Etchers’ Handbook (1881); F. Weidmore, Etching in England (1895); Singer and St George, Etching and Engraving (1896).

ETEOCLES, in Greek legend, king of Thebes, son of Oedipus and Jocasta (Jocaste). After their father had been driven out of the country, he and his brother Polynices agreed to reign alternately for a year. Eteocles, however, refused to keep the agreement, and Polynices fled to Adrastus, king of Argos, whom he persuaded to undertake the famous expedition against Thebes on his behalf. The two brothers met in single combat, and both were slain. The Theban rulers decreed that only Eteocles should receive the honour of burial, but the decree was set at naught by Antigone (q.v.), the sister of Polynices. The fate of Eteocles and Polynices forms the subject of the Seven against Thebes of Aeschylus and the Phoenix of Euripides.

ETESIAN WIND (Lat. etesian, annual; Gr. ἐτος, year), a Mediterranean wind blowing from the north and west in summer for about six weeks annually.

ÉTEX, ANTOINE (1800-1888), French sculptor, painter, and architect, was born in Paris on the 20th of March 1808. He first exhibited in the salon of 1833, his work including a reproduction in marble of his “Death of Hyacinthus,” and the plaster cast of his “Cain” and his “face of a god.” Thiers, who was at this time minister of public works, now commissioned him to execute the two groups of “Peace” and “War,” placed at each side of the Arc de Triomphe. This last, which established his reputation, he reproduced in marble in the salon of 1839. The French capital contains numerous examples of the sculptural works of Étex, which included mythological and religious subjects besides a great number of portraits. His paintings include the subjects of Eurycle and the martyrdom of Saint Sebastian, and among the best known of his architectural productions are the tomb of Napoleon I. in the Invalides and a monument of the revolution of 1848. Étex wrote a number of essays on subjects connected with the arts. The last year of his life was spent at Nice, and he died at Chaville (Seine-et-Oise) on the 14th of July 1888.

ETHER, (C₂H₅)₂O, the Aether of pharmacy, a colourless, volatile, highly inflammable liquid, of specific gravity 0·736 at 96°, boiling-point 35° C, and freezing-point -11°-4 C. (K. Olssewski). It has a strong and characteristic odour, and a hot sweetish taste, is soluble in ten parts of water, and in all proportions in alcohol, and dissolves bromine, iodine, and, in small quantities, sulphur and phosphorus, also the volatile oils, most fatty and resinous substances, guncotton, caoutchouc and certain of the vegetable alkaloids. The vapour mixed with oxygen or air is violently explosive. The making of ether by the action of sulphuric acid on alcohol was known in about the 13th century; and later Basil Valentine and Valerius Cordus described its preparation and properties. The name ether appears to have been applied to the drug only since the times of Frobenius, who in 1730 termed it spiritus aetherius or vini vitriolatus. It was considered to be a sulphur compound, hence its name sulphur ether; this idea was proved to be erroneous by Valentine Rose in about 1800. Ether is manufactured by the distillation of 5 parts of 90% alcohol with 9 parts of concentrated sulphuric acid at a temperature of 140°-145° C, a constant stream of alcohol being caused to flow into the mixture during the operation. The distillate is purified by treatment with lime and calcium chloride, and subsequent distillation. The mechanism of this reaction was explained by A. Williamson in 1850. For other methods of preparation see Etheris.1

The presence of so small a quantity as 1% of alcohol may be detected in ether by the colour imparted to it by aniline violet; if water or acetic acid be present, the ether must be shaken with anhydrous potassium carbonate before the application of the test. When heated with zinc dust, it yields ethylene and water. Chromic acid oxidizes it to acetic acid and oxygen oxidizes it to ethyl peroxide. In contact with hydriodic acid gas at 0°C, it forms ethyl iodide (R. D. Silva, Ber., 1875, 8, p. 993), and with water and a little sulphuric acid at 180°C, it yields alcohol (E. Erlenmeyer, Zeit. f. chemie, 1868, p. 343). It forms crystalline compounds with bromine and with many metallic salts.

Medicine.—For the anaesthetic properties of ether see Anaesthesia. Applied externally, ether evaporates very rapidly, producing such intense cold as to cause marked local anaesthesia. For this purpose it is best applied as a fine spray, but ethyl chloride is generally found more efficient and produces less subsequent discomfort. It aids the absorption of fats and may be used with cold liver oil when the latter is administered by the skin. If it be rubbed in or evaporation be prevented, it acts, like alcohol and chloroform, as an irritant. Ten to twenty minims of ether in a draught is not, however, perhaps the most rapid and powerful cardiac stimulant known, and are often employed for this purpose in cases of syncope under anaesthesia. Taken internally, ether acts in many respects similarly to alcohol and chloroform, but its stimulant action on the heart is much more marked, being exerted both reflexly from the stomach and directly after its rapid absorption. Ether is thus the type of a rapidly diffusible stimulant. It is also useful in relieving the paroxysms of asthma. The dose for repeated administration is from 10 to 30 minims and for a single administration up to a draught.

Chronic Poisoning.—A dose of a little more than a draught (a teaspoonful) will produce a condition of inebriation lasting for one-half to one hour, but the dose must soon be greatly increased. The after-effects are, if anything, rather pleasant, and the habit of ether drinking is certainly not so injurious as alcoholism. The principal symptoms of chronic ether-drinking are a weakening of the activity of the special senses, and notably sight and hearing, a lowering of the intelligence and a degree of general paresis (partial paralysis) of motion.

**ETHEREDGE [or Etheredge], SIR GEORGE (c. 1633–1691),** English dramatist, was born about the year 1633, and belonged to an Oxfordshire family. He is said to have been educated at Cambridge, but Dennis assures us that “to his certain knowledge he understood neither Greek nor Latin.” He travelled abroad early, and seems to have resided in France. It is possible that he witnessed in Paris the performances of some of Molière’s earliest comedies; and he seems, from an allusion in one of his plays, to have been personally acquainted with Bussy Rabutin. On his return to London he studied the law at one of the Inns of Court. His tastes were those of a fine gentleman, and he indulged freely in pleasure.

Sometime soon after the Restoration he composed his comedy of *The Comical Revenge or Love in a Tub,* which introduced him to Lord Buckhurst, afterwards the earl of Dorset. This was brought out at the Duke’s theatre in 1664, and a few copies were printed in the same year. It is partly in rhymed heroic verse, like the stilted tragedies of the Howards and Killigrews, but it contains comic scenes that are exceedingly bright and fresh. The sparring between Sir Frederick and the Widow introduced a style of wit hitherto unknown upon the English stage. The success of this play was very great, but Etheredge waited four years before he repeated his experiment. Meanwhile he gained the highest reputation as a poetical ballad, and moved in the circle of Sir Charles Sedley, Lord Rochester and the other noble wits of the day. In 1668 he brought out *She would if she could,* a comedy in many respects admirable, full of action, wit and spirit, although to the last degree frivolous and immoral. But in this play Etheredge first shows himself a new power in literature; he has nothing of the rudeness of his predecessors or the grossness of his contemporaries. We move in an airy and fantastic world, where flirtation is the only serious business of life. At this time Etheredge was living a life no less frivolous and unprincipled than those of his Courtists and Freemans. He formed an alliance with the famous actress Mrs Elizabeth Barry; she bore him a daughter, on whom he settled £6,000, but who, unhappily, died in her youth. His wealth and wit, the distinction and charm of his manners, won Etheredge the general worship of society, and his temperament is best known by the names his contemporaries gave him, of “gentle George” and “easy Etheredge.” Rochester upbraided him for inattention to literature; and at last, after a silence of eight years, he came forward with one more play, unfortunately his last. *The Man of Mode or Sir Fopling Flutter,* indisputably the best comedy of intrigue written in England before the days of Congreve, was acted and printed in 1676, and enjoyed an unbounded success. Besides the merit of its plot and wit, it had the personal charm of being supposed to satirize, or at least to paint, persons well known in London. *Sir Fopling Flutter* was a portrait of Beau Beau, the reigning exquisitie of the hour; in Dorimant the poet drew the earl of Rochester, and in Medley a portrait of himself; while even the drunken shoemaker was a real character, who made his fortune from being thus brought to public notice. This brilliant success Etheredge retired from literature; his gallantries and his amours, in a few years deprived him of his fortune, and he looked about for a rich match. He was knighted before 1688, and gained the hand and the money of a rich widow. He was sent by Charles II. on a mission to the Hague, and in March 1685 was appointed resident minister in the imperial German court at Regensburg. He was very uncomfortable in Germany, and after three and a half years’ residence left for Paris. He had collected a library at Regensburg, some volumes of which are in the theological college there. His MS. despatches are preserved in the British Museum, where they were discovered and described by Mr Gosse in 1881; they add very largely to our knowledge of Etheredge’s career.

Etheredge deserves to hold a more distinguished place in English literature than has generally been allotted to him. In a dull and heavy age, he inaugurated a period of genuine wit and sprightliness. He invented the comedy of intrigue, and led the way for the masterpieces of Congreve and Sheridan. Before his time the manner of Ben Jonson had prevailed in comedy, and traditional “humours” and typical eccentricities, instead of real characters, had crowded the comic stage. Etheredge paints with a light, faint hand, but it is from nature, and his portraits of fops and beaux are simply uncencelled. No one knows better than he how to present a gay young gentleman, a Dorimant, “an unconfinable rover after amorous adventures.” His genius is as light as thistle-down; he is frivolous, without force of conviction, without principle; but his wit is very sparkling, and his style pure and singularly picturesque. No one approaches Etheredge in delicate touches of dress, furniture and scene; he makes the fine airs of London gentlemen and ladies live before our eyes even more vividly than Congreve does; but he has less insight and less energy than Congreve. Had he been poor or ambitious, he might have been to England almost what Molière was to France, but he was a rich man living at his ease, and he disdained excess in literature. Etheredge was “a fair, slender, genteel man, but spoiled his countenance with drinking.” His contemporaries all agree in acknowledging that he was the soul of affability and sprightly good-nature.

The life of Etheredge was first given in detail by Edmund Gosse in *Seventeenth Century Studies* (1883). His works were edited by A. W. Verity, in 1888. (E. G.)

**ETHERIDGE, JOHN WESLEY** (1804–1866). English non-conformist divine, was born near Newport, Isle of Wight, on the 24th of February 1804. He received most of his early education from his father. Though he never attended any university he acquired ultimately a thorough knowledge of Greek, Latin, Hebrew, Syriac, French and German. In 1824 he was placed on the Wesleyan Methodist plan as a local preacher. In 1826 his offer to enter the ministry was accepted, and after the usual
probationary trial he was received into full connexion at the conference of 1835. For two years after this he remained at Brighton, and in 1833 he removed to Cornwall, being stationed successively at the Truro and Falmouth circuits. From Falmouth he removed to Darlaston, where in 1838 his health gave way. For a good many years he was a superintendent, and lived for a while at Caen and Paris, where in the public libraries he found great facilities for prosecuting his favourite Oriental studies. His health having considerably improved, he became, in 1843, pastor of the Methodist church at Boulogne. He returned to England in 1847, and was appointed successively to the circuits of Islington, Bristol, Leeds, Penzance, Penryn, Truro and St Austell in east Cornwall. Shortly after his return to England he received the degree of Ph.D. from the university of Heidelberg. He was a patient, modest, hard-working and accurate scholar. He died at Camborne on the 24th of May 1866.

His principal works are Horae Aramaicae (1843); History, Liturgies and Literature of the Syrian Churches (1847); The Apostolic Acts and Epistles, from the Peshito or Ancient Syriac (1849); Jerusalem and Tiberias, a Survey of the Religious and Scholastic Learning of the Jews (1856); The Targums of Onkelos and Jonathan ben Uziel (1st vol. in 1856, 2nd in 1865). See Memoir, by Rev. Thorneby Smith (1871). 

ETHERIDGE, ROBERT (1819-1903), English geologist and palaeontologist, was born at Ross, in Herefordshire, on the 3rd of December 1819. After an ordinary school education in his native town, he obtained employment in a business house in Bristol. There he devoted his spare time to natural history pursuits, and in 1850 was appointed curator of the museum attached to the Bristol Philosophical Institution. He also became lecturer on botany in the Bristol medical school. In 1857, through the influence of Sir Roderick I. Murchison, he was appointed to a post in the Museum of Practical Geology in London, and eventually became palaeontologist to the Geological Survey. In 1865 he assisted Prof. Huxley in the preparation of a Catalogue of Fossils in the Museum of Practical Geology. His chief work for many years was in naming the fossils collected during the progress of the Geological Survey, and in supplying the lists that were appended to numerous official memoirs. In this way he acquired an exceptional knowledge of British fossils, and he ultimately prepared an elaborate work entitled Fossils of the British Islands, Stratigraphically and Geographically arranged. Only the first volume dealing with the Palaeozoic species was published (1888). Etheridge also was author of several papers on the Rhaetic Beds, and of an important essay on the Physical Structure of North Devon, and on the Palaeontological Value of the Devonian Fossils (1867). He edited, and in the main rewrote, the second part of a new edition of John Phillips' Manual of Geology—entitled Stratigraphical Geology and Palaeontology (1885). He was elected F.R.S. in 1871, and was president of the Geological Society in 1881-1882. In 1881 Etheridge was transferred from the Geological Survey to the geological department of the British Museum, where he served as assistant keeper until 1891. He died at Chelsea, London, on the 18th of December 1903.

ETHERS, in organic chemistry, compounds of the general formula R-O-R', where R, R' = alkyl or aryl groups. They may be regarded as the anhydrides of the alcohols, being formed by elimination of one molecule of water from two molecules of the alcohols; those in which the two hydrocarbon radicals are similar are known as simple ethers, and those in which they are dissimilar as mixed ethers. They may be prepared by the action of concentrated sulphuric acid on the alcohols, alkyl sulphuric acids being first formed, which yield ethers on heating with alcohols. The process may be made a continuous one by running a thin stream of alcohol continually into the heated reaction mixture of alcohol and sulphuric acid. Benzene sulphonic acid has been used in place of sulphuric acid (F. Krafft, Ber., 1863, 26, p. 2839). A. W. Williamson (Ann., 1853, 77, p. 58; 1852, 81, p. 77) prepared ether by the action of sodium ethylate on ethyl iodide, and showed that all ethers must possess the structural formula given above (see also Brit. Assoc. Reports, 1850, p. 61). They may also be prepared by heating the alkyl halides with silver oxide.

The ethers are neutral volatile liquids (the first member, methyl ether, is a gas at ordinary temperature). Phosphorus pentachloride converts them into alkyl chlorides, a similar decomposition taking place when they are heated with the haloid acids. Nitric acid and chromic acid oxidise them in such a manner that they yield the same products as the alcohols from which they are derived. With chlorine they yield substitution products.

Methyl ether, (CH₃)₂O, was first prepared by J. B. Dumas and E. Peligot (Ann. chim. phys., 1835, 2, p. 19) by heating methyl alcohol with sulphuric acid. It is best prepared by heating methyl alcohol and sulphuric acid to 140° C. and leading the evolved gas into sulphuric acid. The sulphuric acid solution is then allowed to drop slowly into an equal volume of water, when the methyl ether is liberated (E. Erlenmeyer and A. Kriebbaumer, Ber., 1874, 7, p. 699). It is a pleasant-smelling gas, which burns when ignited, and may be condensed to a liquid which boils at 23.6° C. It is somewhat soluble in water and readily soluble in alcohol, and concentrated sulphuric acid.

It combines with hydrochloric acid gas to form a compound (CH₃)₂O-HCl (C. Friedel, Comptes rendus, 1875, 81, p. 152).

Methyl ethyl ether, CH₃-C₂H₅O, is prepared from methyl iodide and sodium ethylate, or from ethyl iodide and sodium methylate (A. W. Williamson, Ann., 1852, 81, p. 77). It is a liquid which boils at 10-8° C.

For diethyl ether see Ether, and for methyl phenylether (anisole) and ethyl phenyl ether (phenetole) see CARBOLIC ACID.

ETHICS, the name generally given to the science of moral philosophy. The word "ethics" is derived from the Gr. ἔθικος, that which pertains to ἔθος, character.

For convenience in reference, the arrangement followed in this article may be explained at the outset:-

C. Modern Ethics—continued

III. Bibliography

Section I. contains a general survey of the subject; it shows in what sense it is regarded as a special field of philosophical investigation—its relations to other departments of thought, especially to psychology, religion and modern physical science. The article makes no attempt to give a detailed, casuistical examination of the matter of ethical theory. For this, reference must be made to special philosophical treatises by writers and thinkers.

Section II. is a historical sketch in four parts tracing the main lines of development in ethical speculation from its birth to the present day. Here again it has been possible to notice only the salient points or landmarks, leaving all detail to special articles as above. All important writers whose names occur in this sketch are treated in special biographical articles, and references are given as often as possible to supplementary articles which illustrate and explain points which cannot be fully treated here. This is especially the case in connexion with technical terms (whose history and meaning are inevitably taken for granted) and biographical information about minor ethical writers.

I. Definition and Subject-Matter of Ethics

In its widest sense, the term "ethics" would imply an examination into the general character or habits of mankind, and would even involve a description or history of the habits of men in particular societies living at different periods of time. Such a field of study would obviously be too wide for any particular science or philosophy to investigate, and moreover portions of the field are already occupied by history, by anthropology and by the particular sciences (e.g. physiology, anatomy, biology), in so far as the habits and character of men depend upon the material processes which these sciences examine. Even philosophies such as logic and aesthetic would be necessary for such an investigation, if thought and artistic production are normal human habits and elements in character. Ethics then is usually confined to the particular field of human character and conduct so far as they depend upon or exhibit certain general principles commonly known as moral principles. Men in general characterize their own conduct and character and that of other men by such general adjectives as good, bad, right and wrong, and it is the meaning and scope of these adjectives, primarily in relation to human conduct, and ultimately in their final and absolute sense, that ethics investigates.

A not uncommon conception of ethics as the "science of conduct" is incorrect for various reasons. (1) The sciences are descriptive or experimental. But a description of what acts or what ends of action men in the present or the past call, or have called, "good" or "bad" is clearly beyond human powers. And experiments in morality (apart from the inconvenient practical consequences likely to ensue) are useless for purposes of ethics, because the moral conscious would itself at one and the same time be required to make the experiment and to provide the subject upon which the experiment is performed. (2) Ethics is a philosophy and not a science. Philosophy is a process of reflection upon the presuppositions involved in unrestricted thought. In logic and metaphysics it investigates either the process of apprehension itself, or conceptions such as cause, substance, space, time, which the ordinary scientific consciousness never criticizes. In moral philosophy the place of the body of sciences, which philosophy as the theory of knowledge investigates, is taken by the developed moral consciousness, which already pronounces moral judgment without hesitation, and claims authority to subject to continual criticism the institutions and forms of social life which it has itself helped to create.

When ethical speculation first begins conceptions such as those of duty, responsibility, the will as the ultimate subject of moral approbation and disapprobation, are already in existence and already operative. Moral philosophy in a certain sense adds nothing to these conceptions, though it sets them in a clearer light. The problems of the moral consciousness at the time at which it first becomes reflective are not strictly speaking philosophical problems at all. It is occupied with just such questions as each individual man who wishes to act rightly is constantly called upon to answer, e.g. questions such as "What particular action will meet the claims of justice under such and such circumstances?" or "What degree of ignorance will excuse this particular person in this particular case from his responsibility?" It tries to attain a knowledge as complete as possible of the circumstances under which the act contemplated must be performed, the personalities of the persons whom it may affect, and the consequences (so far as they can be foreseen) which it will produce, and then by virtue of its own power of moral discrimination pronounces judgment. And the ever-recurring problem of the moral consciousness, "What ought to be done?" is one which receives a clearer and more definite answer as men become more able in the course of moral experience to apply those principles of the moral consciousness which are yet employed in that experience from the outset. Nevertheless there is a sense in which moral philosophy may be said to originate out of difficulties inherent in the nature of morality itself, although it remains true that the questions which ethics attempts to answer are never questions with which the moral consciousness as such is confronted. The fact that men give different answers to such problems which seem similar in character, or even the mere fact that men disregard, when they act immorally, the dictates and implicit principles of the moral consciousness is certain sooner or later to produce the desire either, on the one hand, to justify immoral action by casting doubt upon the authority of the moral consciousness and the validity of its principles, or, on the other hand, to justify particular moral judgments either by (the only valid method) an analysis of the moral principle involved in the judgment and a demonstration of its universal acceptance, or by some attempted proof that the particular moral judgment is arrived at by a process of inference from some universal conception of the Supreme Good or the Final End from which all particular duties or virtues may be deduced. It may be that criticism of morality first originates with a criticism of existing moral institutions or codes of ethics; such a criticism may be due to the spontaneous activity of the moral consciousness itself. But when such criticism passes into the attempt to find a universal criterion of morality—such an attempt being in effect an effort to make morality scientific—and especially when the attempt is seen, as it must in the end be seen, to fail (the moral consciousness being superior to all standards of morality and reposing itself in a particular judgment), then ethics as a process of reflection upon the nature of the moral consciousness may be said to begin. If this be true it follows that one of the chief function of ethics must be criticism of mistaken attempts to find a criterion of morality superior to the pronouncements of the moral consciousness itself. The ultimate superiority of the moral consciousness over all other standards is recognized, even by those who impugn its authority, whenever they claim that all men ought to recognize the superior value of the standards which they themselves wish to substitute. Similarly, their opponents refute their arguments by showing that they are based ultimately upon a recognition of certain distinctions which are moral distinctions (i.e. imply a moral consciousness capable of discriminating between right and wrong in particular cases), and that these moral distinctions conflict with the conclusions which they reach.

This may briefly be illustrated by reference to some of the great fundamental controversies of ethics. None of these originates out of conflicting statements of the moral consciousness, i.e. there is no fundamental contradiction in morality itself. No one (if unsophisticated) ever confused the conception of pleasure with the conception of the Good, or thought that the claims of selfish interest were identical with those of duty. But the controversy between hedonists and antihedonists originates as soon as men reflect that a good which is not in some sense "my" good is not good at all, or that no act can be said to be moral which does not satisfy "me." Or, again, the
ETHICS

raising ultimate questions as to the nature of obligation or moral authority in general. Now if in opposition to such arguments the ultimate character of moral obligation be defended, it will be necessary to point out that no one feels moral sentiments except in connexion with particular objects of moral approbation or disapprobation (e.g. gratitude is inexplicable apart from a particular relationship existing between two or more persons), and that these objects are objects of the moral consciousness alone. But such a line of argument is certain to make necessary an inquiry into the nature of the objects of psychological study which may produce quite unforeseen results for psychology.

Nothing therefore is to be gained by confining ethics within limits which must from the nature of the case be arbitrary. The defender at all events of the supremacy of moral intuitions must be prepared to follow whither the argument leads, into whatever strange quarters it may direct him. But this much may be said by way of delineation of the scope of ethics: however complicated and involved its arguments and processes of inference may become, the facts from which they start and the conclusions to which they point are such as the moral consciousness alone can understand or warrant.

(H. H. W.)

II. HISTORICAL SKETCH

A. Greek and Graeco-Roman Ethics.—The ethical speculation of Greece, and therefore of Europe, had no abrupt and absolute beginning. The naive and fragmentary precepts of conduct, which are everywhere the earliest manifestation of nascent moral reflection, are a noteworthy element in the gnomic poetry of the 7th and 6th centuries B.C. Their importance is shown by the traditional enumeration of the Seven Sages of the 6th century, and their influence on ethical thought is attested by the references of Plato and Aristotle. But from these unscientific utterances to a philosophy of morals was a long process. In the practical wisdom of Thales (q.v.), one of the seven, we cannot discern any systematic theory of morality. In the case of Pythagoras, conspicuous among pre-Socratic philosophers as the founder not merely of a school, but of a sect or order bound by a common rule of life, there is a closer connexion between moral and metaphysical speculation. The doctrine of the Pythagoreans that the essence of justice (conceived as equal retribution) was a square number, indicates a serious attempt to extend to the region of conduct their mathematical view of the universe; and the same may be said of their classification of good with unity, straightness and the like, and of evil with the opposite qualities. Still, the enunciation of the moral precepts of Pythago-1

1 This well-known phrase was originally attributed to the Pythagoreans.
The truth is that no system of ethics could be constructed until attention had been directed to the vagueness and inconsistency of the common moral opinions of mankind. For this purpose was needed the concentration of a philosophic intellect of the first order on the problems of practice. In Socrates we first find the required combination of a paramount interest in conduct and an ardent desire for knowledge. The pre-Socratic thinkers were all primarily devoted to ontological research; but by the middle of the 5th century B.C. the conflict of their dogmatic systems had led some of the keenest minds to doubt the possibility of penetrating the secret of the physical universe. This doubt found expression in the reasoned scepticism of Gorgias, and produced the famous proposition of Protagoras, that human apprehension is the only standard of existence. The same feeling led Socrates to abandon the old physico-metaphysical inquiries. In his case, moreover, it was strengthened by a naive piety that forbade him to search into things of which the gods seemed to have reserved the knowledge to themselves. The regulation of human action, on the other hand (except on occasions of special difficulty, for which omens and oracles might be vouchsafed), they had left to human reason. On this accordingly Socrates concentrated his efforts.

Though, however, Socrates was the first to arrive at a proper conception of the problems of conduct, the general idea did not originate with him. The natural reaction against the metaphysical and ethical dogmatism of the early thinkers had reached its climax in the Sophists (q.v.).

Gorgias and Protagoras are only representatives of what was really a universal tendency to abandon dogmatic theory and take refuge in practical matters, and especially, as was natural in the Greek city-state, in the civic relations of the citizen. The education given by the Sophists aimed at no general theory of life, but professed to expound the art of getting on in the world and of managing public affairs. In their eulogy of the virtues of the citizen, they pointed out the prudential character of justice and the like as a means of obtaining pleasure and avoiding pain. The Greek conception of society was such that the life of the free-born citizen consisted mainly of his public function, and, therefore, the pseudo-ethical disquisitions of the Sophists satisfied the requirements of the age. None thought of ἀρετή (virtue or excellence) as a unique quality possessed of an intrinsic value, but as the virtue of the citizen, just as good a citizen as another. This was, of course, as in other activities of the age, a determination to acquire technical knowledge, and to apply it directly to the practical issue; just as music was being enriched by new technical knowledge, architecture by modern theories of plans and T-squares (sc. Hippodamian), the handling of soldiers by the new technique of “tactics” and “hoplitos,” so citizenship must be analyzed afresh, systematized and adapted in relation to modern requirements. The Sophists had studied these matters superficially indeed but with thoroughness as far as they went, and it is not remarkable that they should have taken the methods which were successful in rhetoric, and applied them to the “science and art” of civic virtues. Plato’s Protagoras claims, not unjustly, that in teaching virtue they simply did systematically what every one else was doing at haphazard. But in the true sense of the word, they had no ethical system at all; nor did they contribute save by contrast to ethical speculation. They merely analysed conventional formulae, much in the manner of certain modern so-called “scientific” moralists. Into this arena of hazy popular common sense Socrates threw his skeptical bolt of lightning, showing that these popular lecturers, in spite of their fertile eloquence, could not defend their fundamental assumptions, nor even give rational definitions of what they professed to explain. Not only were they thus “ignorant,” but they were also perpetually inconsistent with themselves in dealing with particular instances. Thus, by the aid of his famous “dialectic,” Socrates arrived at first at the negative result that the professed teachers of the people were as ignorant as he himself claimed to be, and in a measure justified the eulogy of Aristotle that he rendered to philosophy the service of “introducing induction and definitions.”

This description of his work is, however, both too technical and too positive; if we may judge from those earlier dialogues of Plato in which the real Socrates is found least modified. The pre-eminent wisdom which the Delphic oracle attributed to him was held by himself to consist in a unique consciousness of ignorance. Yet it is equally clear from Plato that there was a most important positive element in the teaching of Socrates in virtue of which it is to just to say with Alexander Bain, “the first important name in ancient ethical philosophy is Socrates.” The union of the negative and the positive elements in his work has caused historians no little perplexity, and we cannot quite save the philosopher’s consistency unless we regard some of the doctrines attributed to him by Xenophon as merely tentative and provisional. Still the positions of Socrates that are most important in the history of ethical thought not only are easy to harmonize with his conviction of ignorance, but even render it easier to understand his unweaned cross-examination of common opinion. While he showed clearly the difficulty of acquiring knowledge, he was convinced that knowledge alone could be the source of a coherent system of virtue, as error of evil. Socrates, therefore, first in the history of thought, propounds a positive ethic, which calls on men to know and to act in accordance with knowledge. This principle involved the paradox that no man, knowing good, would do evil. But it was a paradox derived from his unanswerable truisms, “Every one wishes for his own good, and would get it if he could,” and “No one would deny that justice and virtue generally are goods, and of all goods the best.” All virtues are, therefore, summed up in knowledge of the good. But this good is not, for Socrates, duty as distinct from interest. The force of the paradox depends upon a blending of duty and interest in the single notion of good, a blending which was dominant in the common thought of the age. This it is which forms the kernel of the positive thought of Socrates according to Xenophon. He could give no satisfactory account of Good in the abstract, and evaded all questions on this point by saying that he knew “no good that was not good for something in particular,” but that good is consistent with itself. For himself he prized above all things the wisdom that is virtue, and in the task of producing it he endured the hardest penury, maintaining that such life was richer in enjoyment than a life of luxury. This many-sidedness of view is illustrated by his blending of noble and merely utilitarian sentiment in his account of friendship: a friend who can be of no service is valueless; yet the highest service that a friend can render is moral improvement.

The historically important characteristics of his moral philosophy, if we take (as we must) his teaching and character together, may be summarized as follows:—(1) an ardent inquiry for knowledge nowhere to be found, but which, if found, would perfect human conduct; (2) a demand meanwhile that men should act as far as possible on some consistent theory; (3) a provisional adhesion to the commonly received view of good, in all its incoherence, and a perpetual readiness to maintain the harmony of its different elements, and demonstrate the superiority of virtue by an appeal to the standard of self-interest; (4) personal firmness, as apparently easy as it was actually invincible, in carrying out consistently such practical convictions as he had attained. It is only when we keep all these points in view that we can understand how from the spring of Socratic conversation flowed the divergent streams of Greek ethical thought.

Socrates. — Most of the ethical schools trace their immediate origin to the circle that gathered round Socrates—the Megarian, the Platonic, the Cynic and the Cyrenaic. The impress of the master is manifest on all, in spite of the wide differences that divide them; they all agree in holding the most important possession of man to be wisdom or knowledge, and the most important knowledge to be knowledge of Good. Here, however, the agreement ends. The more philosophic part of the circle, forming a group in which Euclid of Megara (see MEGARIAN SCHOOL) seems at first to have taken the lead, regarded this Good as the object of a still unfulfilled quest, and were led to identify it with the hidden secret
of the universe, and thus to pass from ethics to metaphysics. Others again, whose demand for knowledge was more easily satisfied, and who were more impressed with the positive and practical side of the master's teaching, made the quest a much simpler affair. They took the Good as already known, and held philosophy to consist in the steady application of this knowledge to conduct. Among these were Antisthenes the Cynic and Aristippus of Cyrene. It is by their recognition of the duty of living consistently by theory instead of mere impulse or custom, their sense of the new value given to life through this rationalization, and their effort to maintain the easy, calm, unswerving firmness of the Socratic temper, that we recognize both Antisthenes and Aristippus as "Socratic men," in spite of the completeness with which they divided their master's positive doctrine into systems diametrically opposed. Of their contrasting principles we may perhaps say, that while Aristippus took the most obvious logical step for reducing the teaching of Socrates to clear dogmatic unity, Antisthenes certainly drew the most natural inference from the Socratic life.

Aristippus (see Cyrenaics) argued that, if all that is beautiful or admirable in conduct has this quality as being useful, i.e. productive of some further good; if virtuous action is essentially action done with insight, or rational apprehension of the act as a means to this good, good must be pleasure. Bodily pleasures and pains Aristippus held to be the keystone, though he does not seem to have maintained this materialistic theory, as he admitted the existence of purely mental pleasures, such as joy in the prosperity of one's native land. He fully recognized that his good was capable of being realized only in successive parts, and gave even exaggerated emphasis to the rule of seeking the pleasure of the moment, and not troubling oneself about a dubious future. It was in the calm, resolute, skilful culling of such pleasures as circumstances afforded from moment to moment, undisturbed by passion, prejudices or superstition, that he conceived the quality of wisdom to be exhibited; and tradition represents him as realizing this ideal to an impressive degree. Among the prejudices from which the wise man was free he included all regard to customary morality beyond what was due to the actual penalties attached to its violation; though he held, with Socrates, that these penalties actually render conformity reasonable. Thus early in the history of ethical theory appeared the most thoroughgoing exposition of hedonism.

Far otherwise was the Socratic spirit understood by Antisthenes and the Cynics (q.v.). They equally held that no speculative research was needed for the discovery of good and virtue, and maintained that the Socratic wisdom was exhibited, not in the skilful pursuit, but in the rational disregard of pleasure,—in the clear apprehension of the intrinsic worthlessness of this and most other objects of men's ordinary desires and aims. Pleasure, indeed, Antisthenes declared roundly to be an evil; "Better madness than a surrender to pleasure." He did not overlook the need of supplementing merely intellectual insight by "Socratic force of soul"; but it seemed to him, by insight and self-mastery combined, an absolute spiritual independence might be attained which left nothing wanting for perfect well-being (see also Diogenes). For as for poverty, painful toil, disrepute, and such evils as men dread most, these, he argued, were positively useful as means of progress in spiritual freedom and virtue. There is, however, in the Cynic notion of wisdom, no positive criterion beyond the mere negation of irrational desires and prejudices. We saw that Socrates, while not claiming to have found the abstract theory of good or wise conduct, practically understood by it the faithful performance of customary duties, maintaining always that his own happiness was therewith bound up. The Cynics more boldly discarded both pleasure and mere custom as alike irrational; but in so doing they left the freed reason with no definite aim but its own freedom. It is absurd, as Plato urged, to say that knowledge is the good, and then when asked "knowledge of what?" to have no positive reply but "of the good"; but the Cynics do not seem to have made any serious effort to escape from this absurdity.

The ultimate views of these two Socratic schools we shall have to notice presently when we come to the post-Aristotelian schools. We must now proceed to trace the fuller development of the Socratic theory in the hands of Plato and Aristotle.

The ethics of Plato cannot properly be treated as a finished result, but rather as a continual movement from the position of Socrates towards the more complete, articulate system of Aristotle; except that there are ascetic and mystical suggestions in some parts of Plato's teaching which find no counterpart in Aristotle, and in fact disappear from Greek philosophy soon after Plato's death until they are revived and fantastically developed in Neopythagoreanism and Neo-Platonism. The first stage at which we can distinguish Plato's ethical view from that of Socrates is presented in the Protagoras, where he makes a serious, though clearly tentative effort to define the object of that knowledge which he with his master regards as the essence of all virtue. Such knowledge, he here maintains, is really mensuration of pleasures and pains, whereby the wise man avoids those mistakes under-estimates of future feelings in comparison with present which we commonly call "yielding to fear or desire." This hedonism has perplexed Plato's readers needlessly (as we have said in speaking of the Cyrenaics), inasmuch as hedonism is the most obvious corollary of the Socratic doctrine that the different common notions of pleasure; of pain, of beauty; and of utility, material and spiritual, to be somehow interpreted by each other. By Plato, however, this conclusion could have been held only before he had accomplished the movement of thought by which he carried the Socratic method beyond the range of human conduct and developed it into a metaphysical system.

This movement may be expressed thus. "If we know," said Socrates, "what justice is, we can give an account or definition of it"; true knowledge must be knowledge of the general fact, common to all the individual cases to which we apply our general notion. But this must be no less true of other objects of thought and discourse; the same relation of general notions to particular examples extends through the whole physical universe; we can think and talk of it only by means of such notions. True or scientific knowledge then must be general knowledge, relating, not to individuals primarily, but to the general facts or qualities which individuals exemplify; in fact, our notion of an individual, when examined, is found to be an aggregate of such general qualities. But, again, the object of true knowledge must be what really exists; hence the reality of the universe must lie in general facts or relations, and not in the individuals that exemplify them. So far the steps are plain enough; but we do not yet see how this logical Realism (as it was afterwards called) comes to have the essentially ethical character that especially interests us in Platonism. Plato's philosophy is now concerned with the whole universe of being; yet the ultimate object of his philosophic contemplation is still "the good," now conceived as the ultimate ground of all being and knowledge. That is, the essence of the universe is identified with its end,—the "formal" with the "final" cause of things, to use the later Aristotelian phraseology. How comes this about?

Perhaps we may best explain this by recurring to the original application of the Socratic method to human affairs. Since all rational activity is for some end, the different arts or functions of human industry are naturally defined by a statement of their ends or uses; and similarly, in giving an account of the different artists and functionaries, we necessarily state their end, "what they are good for." In a society well ordered on Socratic principles, every human being would be put to some use; the essence of his life would consist in doing what he was good for (his proper ἐργον). But again, it is easy to extend this view throughout the whole region of organized life; an eye that does not attain its end by seeing is without the essence of an eye. In short, we may say of all organs and instruments that they are what we think them in proportion as they fulfil their function and attain their end. If, then, we conceive the whole universe organically, as a complex arrangement of means to ends, we shall
understand how Plato might hold that all things really were, or (as we say) "realized their idea," in proportion as they accomplished the special end or good for which they were adapted. Even Socrates, in spite of his aversion to physics, was led by pious reflection to expound a teleological view of the physical world, as ordered in all its parts by divine wisdom for the realization of some divine end; and, in the metaphysical turn which Plato gave to this view, he was probably anticipated by Euclid of Megara, who held that the one real being is "that which we call by many names, Good, Wisdom, Reason or God," to which Plato, raising to a loftier signification the Socratic identification of the beautiful with the useful, added the further name of Absolute Beauty, explaining how man’s love of the beautiful finally reveals itself as the yearning for the end and essence of being.

Plato, therefore, took this vast stride of thought, and identified the ultimate notions of ethics and ontology. We have now to see what attitude he will adopt towards the practical inquiries from which he started. What will now be his view of wisdom, virtue, pleasure and their relation to human well-being?

The answer to this question is inevitably somewhat complicated. In the first place we have to observe that philosophy has not only the first cause from which it proceeds, but also the lecture-room. The quest of Socrates was for the true art of conduct for a man living a practical life among his fellows. But if the objects of abstract thought constitute the real world, of which this world of individual things is but a shadow, it is plain that the highest, most real life must lie in the former region and not in the latter. It is in contemplating the abstract reality which concrete things obscurely exhibit, the type or ideal which they imperfectly imitate, that the true life of the mind in man must consist; and as man is most truly man in proportion as he is mind, the desire of one’s own good, which Plato, following Socrates, held to be permanent and essential in every living thing, becomes in its highest form the philosophic yearning for knowledge. This yearning, he held, springs—like more sensual impulses—from a sense of want of something formerly possessed, of which there remains a latent memory in the soul, strong in proportion to its philosophic capacity; hence it is that in learning any abstract truth by scientific demonstration we merely make explicit what we already implicitly know; we bring into clear consciousness hidden memories of a state in which the soul looked upon Reality and Good face to face, before the change that impressed her with the body and mingled her true nature with fleshy feelings and impulses. We thus reach the paradox that the true art of living is really an “art of dying” as far as possible to mere sense, in order more fully to exist in intimate union with absolute goodness and beauty. On the other hand, since the philosopher must still live and act in the concrete sensible world, the Socratic identification of wisdom and virtue is fully maintained by Plato. Only he who apprehends good in the abstract can imitate it in such transient and imperfect good as may be realized in human life, and it is impossible that, having this knowledge, he should not act on it, whether in private or public affairs. Thus, in the true philosopher, we shall necessarily find the practically good man, who being “likest of men to the gods is best loved by them”; and also the perfect statesman, if only the conditions of his society allow him a sphere for exercising his statesmanship.

The characteristics of this practical goodness in Plato’s matured thought correspond to the fundamental conceptions in his view of the universe. The soul of man, in its good or normal condition, must be ordered and harmonized to its highest end; the question then arises, “Wherein does this order or harmony precisely consist?” In explaining how Plato was led to answer this question, it will be well to notice that, while faithfully maintaining the Socratic doctrine that the highest virtue was inseparable from knowledge of the good, he had come to recognize an inferior kind of virtue, possessed by men who were not philosophers. It is plain that if the good that is to be known is the ultimate ground of the whole of things, it is attainable only by a select and carefully trained few. Yet we can hardly restrict all virtue to these alone. What account, then, was to be given of ordinary “civic” bravery, temperance and justice? It seemed clear that men who did their duty, resisting the seductions of fear and desire, must have right opinions, if not knowledge, as to the good and evil in human life; but whence comes this right “opinion”? Partly, Plato said, it comes by nature and “divine allotment,” but for its adequate development “custom and practice” are required. Hence the paramount importance of education and discipline for civic virtue; and even for future philosophers such moral culture, in which physical and aesthetic training must co-operate, is indispensable; no merely intellectual preparation will suffice. His point is that perfect knowledge cannot be implanted in a soul that has not gone through a course of preparation including much more than physical training. What, then, is this preparation? A distinct step in psychological analysis was taken when Plato recognized that its effect was to produce the “harmony” above mentioned among different parts of the soul, by subordinating the impulsive elements to reason. These non-rational elements he further distinguished as appetitive (τὸ ἐπιθυμίατον) and spirited (τὸ θυμωνοῦντος οὗ θυμὸς)—the particular separateness of which from each other and from reason he held to be established by our inner experience.

On this triple division of the soul he founded a systematic view of the four kinds of goodness recognized by the common moral consciousness of Greece, and in later times known as the Cardinal Virtues (ἡ ἡγίασμα). Of these the two most fundamental were (as has been already indicated) wisdom—in its highest form philosophy—and that harmonious and regulated activity of all the elements of the soul which Plato regards as the essence of uprightness in social relations (δύνασθαι). The import of this term is essentially social; and we can explain Plato’s use of it only by reference to the analogy which he drew between the individual man and the community. In a rightly ordered polity social and individual well-being alike would depend on that harmonious action of diverse elements, each performing its proper function, which in its social application is more naturally termed δύνασθαι. We see, moreover, how in Plato’s view the fundamental virtues, Wisdom and Justice in their highest forms, are mutually involved. Wisdom will necessarily maintain orderly activity, and this latter consists in regulation by wisdom, while the two more special virtues of Courage (ἀνοιχτία) and Temperance (ἐρήμεια) are established by our inner experience.

Such, then, are the forms in which essential good seemed to manifest itself in human life. It remains to ask whether the statement of these gives a complete account of human well-being, or whether pleasure also is to be included. On this point Plato’s view seems to have gone through several oscillations. After apparently maintaining (Protagoras) that pleasure is the good, he passes first to the opposite extreme, and denies it (Phaedo, Gorgias) to be a good at all. For (1), as concrete and transient, it is obviously not the real essential good that the philosopher seeks; (2) the feelings most prominently recognized as pleasures are bound up with pain, as good can never be with evil; in so far, then, as common sense rightly recognizes some pleasures as good, it can only be from their tendency to produce some further good. This view, however, was too violent a divergence from Socrates for Plato to remain in it. That pleasure is not the real absolute good, was no ground for not including it in the good of concrete human life; and after all only coarse and vulgar pleasures were indissolubly linked to the pains of want. Accordingly, in the Republic he has no objection to trying the question of the intrinsic superiority of philosophic or virtuous1 life by the standard of pleasure, and argues that the philosophic (or good) man alone enjoys real pleasure, while the sensualist spends his life in oscillating between painful want and the merely neutral state of painlessness, which he mistakes for positive pleasure. Still more

---

1It is highly characteristic of Platonism that the issue in this dialogue, as originally stated, is between virtue and vice, whereas, without any avowed change of ground, the issue ultimately discussed is between the philosophic life and the life of vulgar ambition or sensual enjoyment.
emphatically is it declared in the Laws that when we are "discoursing to men, not to gods," we must show that the life which we praise, a best and noblest is also that in which there is the greatest excess of pleasure over pain. But though Plato holds this inseparable connexion of best and pleasantest to be true and important, it is only for the sake of the vulgar that he lays this stress on pleasure. For in the most philosophical comparison in the Philebus between the claims of pleasure and wisdom the former is altogether worsted; and though a place is allowed to the pure pleasures of colour, form and sound, and of intellectual exercise, and even to the "necessary" satisfaction of appetite, it is only a subordinate one. At the same time, in his later view, Plato avoids the exaggeration of denying all positive quality of pleasure even to the coarser sensual gratifications; they are undoubtedly cases of that "replenishment" or "restoration" to its "natural state" of a bodily organ, in which he defines pleasure to consist (see Timaeus, pp. 64, 65); he merely maintains that the common estimate of them is to a large extent illusory, or a false appearance of pleasure is produced by contrast with the antecedent or concomitant painful condition of the organ. It is not surprising that this somewhat complicated and delicately balanced view of the relations of "good" and "pleasure" was not long maintained in Platonic doctrine, and that under Speusippus, Plato's successor, the main body of Platonists took up an anti-hedonistic position, as we learn from the polemic of Aristotle. In the Philebus, however, though a more careful psychological analysis leads him to soften down the exaggerations of this attack on sensual pleasure, the antithesis of knowledge and pleasure is again sharpened, and a desire to depreciate even good pleasures is more strongly shown; still even here pleasure is recognized as a constituent of that philosophic life which is the highest human good, while in the Laws, where the subject is more popularly treated, it is admitted that we cannot convince man that the just life is the best unless we can also prove it to be the pleasantest.

When a student passes from Plato to Aristotle, he is so forcibly impressed by the contrast between the habits of mind of the two authors, and the literary manners of the two philosophers, that it is easy to understand how their systems have come to be popularly conceived as diametrically opposed to each other; and the uncompromising polemic which Aristotle, both in his ethical and metaphysical treatises, and that under Speusippus, Plato's successor, the main body of Platonists took up an anti-hedonistic position, as we learn from the polemic of Aristotle. In the Philebus, however, though a more careful psychological analysis leads him to soften down the exaggerations of this attack on sensual pleasure, the antithesis of knowledge and pleasure is again sharpened, and a desire to depreciate even good pleasures is more strongly shown; still even here pleasure is recognized as a constituent of that philosophic life which is the highest human good, while in the Laws, where the subject is more popularly treated, it is admitted that we cannot convince man that the just life is the best unless we can also prove it to be the pleasantest.

Plato and Aristotle. The closer inspection shows us that when a later president of the Academy (Antiochus of Ascalon) repudiated the scepticism which for two hundred years had been accepted as the traditional Platonic doctrine, he had good grounds for claiming Plato and Aristotle as consistent authorities for the ethical position which he took up. For though Aristotle's divergence from Plato is very conspicuous when we consider either his general conception of the subject of ethics, or the details of his system of virtues, still his agreement with his master is almost complete as regards the main outline of his theory of human good; the difference between the two practically vanishes when we view them in relation to the later controversy between Stoics and Epicureans. Even on the cardinal point on which Aristotle entered into direct controversy with Plato, the definite disagreement between the two is less than at first appears; the objections of the disciple hit that part of the master's system that was rather imagined than thought; the main positive result of Platonic speculation only gains in distinctness by the application of Aristotelian analysis.

Plato, we saw, held that there is one supreme science or wisdom, of which the ultimate object is absolute good; in the knowledge of this, the knowledge of all particular goods—that is, of all that we rationally desire to know—is implicitly contained; and also all practical virtue, as no one who truly knows what is good can fail to realize it. But in spite of the intense conviction with which he thus identified metaphysical speculation and practical wisdom, we find in his writings no serious attempt to deduce the particulars of human well-being from his knowledge of absolute good, still less to unfold from it the particular cognitions of the special arts and sciences. Indeed, we may say that the distinction which Aristotle explicitly draws between speculative science or wisdom and practical wisdom (on its political side statesmanship) is really indicated in Plato's actual treatment of the subjects, although the express recognition of it is contrary to his principles. The discussion of good (e.g.) in his Philebus relates entirely to human good, and the respective claims of Thought and Pleasure to constitute this; he only refers in passing to the Divine Thought that is the good of the ordered world, as something clearly beyond the limits of the present discussion. So again, in his last great ethico-political treatise (the Laws) there is hardly a trace of his peculiar metaphysics. On the other hand, the relation between human and divine good, as presented by Aristotle, is so close that we can hardly conceive Plato as having definitely thought it closer. The substantial good of the universe, in Aristotle's view, is the pure activity of universal abstract thought, at once subject and object, which, itself changeless and eternal, is the final cause and first source of the whole process of change in the concrete world. And both he and Plato hold that a similar activity of pure speculative intellect is that in which the philosopher will seek to exist, though he must, being a man, concern himself with the affairs of this life; so that his highest good will be attained by realizing perfect moral excellence. It is doubtful whether Aristotle's demonstration of the inappropriateness of attributing moral excellence to the Deity seems to contradict Plato's doctrine that the just man as such is "like the gods," but here again the discrepancy is reduced when we remember that the essence of Plato's justice (σωφροσύνη) is harmonious activity. No doubt, too, Aristotle's attribution of pleasure to the Divine Existence shows a profound metaphysical divergence from Plato; but it is a divergence which has no practical importance. Nor, again, is Aristotle's divergence from the Socratic principle that all "virtue is knowledge" substantially greater than Plato's, though it is more plainly expressed. Both accept the paradox in the qualified sense that no one can deliberately act contrary to what appears to him good, and that perfect virtue is inseparably bound up with perfect wisdom or moral insight. Both, however, recognize that this actuality of moral insight is not a function of the intellect only, but depends rather on careful training in good habits applied to minds of good natural dispositions, though the "doer" does not thereby acquire a more definite and prominent place in Aristotle's system. The dialectical content of virtue, as an essential characteristic of virtuous action, is that it is chosen for its own sake, for the beauty of virtue alone; but herein he merely formulates the conviction that his master inspires. Nor, finally, does Aristotle's account of the relation of pleasure to human well-being (although he has to combat the extreme anti-hedonism to which the Platonic school under Speusippus had been led) differ materially from the outcome of Plato's thought on this point, as the later dialogues present it to us. Pleasure, in Aristotle's view, is not the primary constituent of well-being, but rather an inseparable accident of it; human well-being is essentially well-doing, excellent activity of some kind, whether its aim and end be abstract truth or noble conduct; knowledge and virtue are objects of rational choice apart from the pleasure attending them; still all activities are attended and in a manner perfected by pleasure, which is better and more desirable in proportion to the excellence of the activity. He no doubt criticizes Plato's account of the nature of pleasure, arguing that we cannot properly conceive pleasure either as a "process" or "state" in the true strict sense of the word, but the latter term, he truly says, denotes a material rather than a psychic fact. But then he adheres with the general ethical agreement between the two thinkers; and the doctrine that vicous pleasures are not true or real pleasures so characteristically Platonic that we are almost surprised to find it in Aristotle.

In so far as there is any important difference between the Platonic and the Aristotelian views of human good, we may observe that the latter has substantially a closer correspondence to the positive element in the ethical teaching of Socrates,
though it is presented in a far more technical and scholastic form, and involves a more distinct rejection of the fundamental Socratic paradox. The same result appears when we compare the methods of the three philosophers.

Aristotle's ethics.

Although the Socratic induction forms a striking feature of Plato's dialogues, his ideal method of ethics is purely deductive; he admits common sense only as supplying provisional steps and starting-points from which the mind is to ascend to knowledge of absolute good, through which knowledge alone, as he conceives, the lower notions of particular goods are to be truly conceived. Aristotle, discarding the transcendentalism of Plato, naturally retained from Plato's teaching the original Socratic method of induction from and verification by common opinion. Indeed, the windings of his exposition are best-understood if we consider his literary manner as a kind of Socratic dialogue formalized and reduced to a monologue. He first leads us by an induction to the fundamental notion of ultimate end or good for man. All men, in acting, aim at some result, either for its own sake or as a means to some further end; but obviously not everything can be sought merely as a means; there must be some ultimate end. In fact men commonly recognize such an end, and agree to call appetitive (an appetitive (semi-rati that) takes as its name how shall we find the true view? We observe that men are classified according to their functions; all kinds of man, and indeed all organs of man, have their special functions, and are judged as functionaries and organs according as they perform their functions well or ill. May we not then infer that man, as man, has his proper function, and that the well-being or "doing well" that all seek really lies in fulfilling well the proper function of man,—that is, in living well that life of the rational soul which we recognize as man's distinctive attribute?

Again, this Socratic deference to common opinion is not shown merely in the way by which Aristotle reaches his fundamental conception; it equally appears in his treatment of the conception itself. In the first place, though in Aristotle's view the most perfect well-being consists in the exercise of man's "divinest part," pure speculative reason, he keeps far from the paradox of putting forward this and nothing else as human good; so far, indeed, that the greater part of his treatise is occupied with an exposition of the inferior good which is realized through the exercise of the speculative reason. He recognizes the rational element of the soul operates under the due regulation of reason. Even when the notion of "good performance of function" was thus widened, and when it had further taken in the pleasure that is inseparably connected with such functioning, it did not yet correspond to the whole of what a Greek commonly understood as "human well-being." We may grant, indeed, that a moderate provision of material wealth is indirectly included, as an indispensable pre-requisite of a due performance of many functions as Aristotle conceives it—his system admits of no beauties for the poor; still there remain other goods, such as beauty, good birth, welfare of progeny, the presence or absence of which influenced the common view of a man's well-being, though they could hardly be shown to be even indirectly important to his "well-acting." These Aristotle attempts neither to exclude from the philosophic conception of well-being nor to include in his formal definition of it. The deliberate looseness which is thus given to his fundamental doctrine characterizes more or less his whole discussion of ethics. He plainly says that the subject who admits of completely scientific treatment; his aim is to give not a definite theory of human good, but a practically adequate account of its most important constituents.

The most important element, then, of well-being or good life for ordinary men Aristotle holds to consist in well-doing as determined by the notions of the different moral excellences.

1 This cardinal term is commonly translated "happiness"; and it must be allowed that it is the most natural term for what we (in English) agree to call "our being's end and aim." But happiness so definitely signifies a state of feeling that it will not admit the interpretation that Aristotle (as well as Plato and the Stoics) express gives to ἔθικος; the confusion is best avoided by rendering the word by the less familiar "well-being."
It ought to be said that Aristotle does not present the formula just discussed as supplying a criterion of good conduct in any particular case; he expresses himself to be the other way about, "correct reasoning, and the judgment of the practically-wise man (δικίως)." We cannot, however, find that he has furnished any substantial principles for its determination; indeed, he hardly seems to have formed a distinct general idea of the practical syllogism by which he conceives it to be effected. 1

The kind of reasoning which his view of virtuous conduct requires is one in which the ultimate major premise states a distinctive characteristic of some virtue, and one or more minor premises show that such characteristic belongs to a certain mode of conduct under given circumstances; since it is essential to good conduct that it should contain its end in itself, and be chosen for its own sake. But he has not failed to observe that practical reasonings are not commonly of this kind, but are rather concerned with actions as means to ulterior ends; indeed, he lays stress on this as a characteristic of the "political" life, when he wishes to prove its inferiority to the life of pure speculation. Though common sense will admit that virtues are the best of goods, it still undoubtedly conceives practical wisdom as chiefly exercised in providing those inferior goods which Aristotle, after recognizing the need or use of them for the realization of human well-being, has dropped out of sight; and the result is, that in trying to make clear his conception of practical wisdom we find ourselves fluctuating continually between the common notion of which he does not distinctly reject, and the notion required as the keystone of his ethical system.

On the whole, there is probably no treatise so masterly as Aristotle's Ethics, and containing so much clear and valid thought, that yet leaves on the reader's mind so strong an impression of dispersive and incomplete work. It is only by dwelling on these defects that we can understand the small amount of influence that his system exercised during the five centuries after his death, as compared with the effect which it has had, directly or indirectly, in shaping the thought of modern Europe. Partly, no doubt, the limited influence of his disciples, the Peripatetics (q.v.), is to be attributed to that exaltation of the purely speculative life which distinguished the Aristotelian ethics from other later systems, and which was too alien from the common moral consciousness to find much acceptance in an age in which the ethical aims of philosophy had again become paramount. Partly, again, the analytical distinctness of Aristotle's manner brings into special prominence the difficulties that attend the Socratic effort to reconcile the ideal aspirations of men with the principles on which their practical reasonings are commonly conducted. The conflict between these two elements of Common Sense was too profound to be compromised; and the moral consciousness of mankind demanded a more trenchant partisanship than Aristotle's. Its demands were met by the Stoic school which separated the moral from the worldly view of life, with an absoluteness and definiteness that caught the imagination; which regarded practical goodness as the highest manifestation of its ideal of wisdom; and which bound the common notions of duty into an apparently coherent system, by a formula that comprehended the whole of human life, and exhibited its relation to the ordered process of the universe. The intellectual descent of its ethical doctrines is principally to be traced to Socrates through the Cynics, though an important element in them seems attributable to the school that inherited the "Academy" of Plato. Both Stoic and Cynic maintained, in its sharpest form, the fundamental tenet that the practical knowledge which is virtue, with the condition of soul that is inseparable from it, is alone to be accounted good. He who exercises this wisdom or knowledge has complete well-being; all else is indifferent to him. It is true that the Cynics were more concerned to emphasize the negative side of the sage's well-being, while the Stoics brought in more prominence of positive sides. This difference, however, did not amount to disagreement. The Stoics, in fact, seem generally to have regarded the eccentricities of Cynicism as an emphatic manner of expressing the essential antithesis between philosophy and the world; a manner which, though not necessary or even normal, might yet be advantageously adopted by the sage under certain circumstances. 2

Wherein, then, consists this knowledge or wisdom that makes free and perfect? Both Cynics and Stoics (q.v.) agreed that the most important part of it was the knowledge that the sole good of man lay in this knowledge or wisdom itself. It must be understood that by wisdom they meant wisdom realized in act; indeed, they did not conceive the existence of wisdom as separable from such realization. We may observe, too, that the Stoics rejected the divergence which we have seen gradually taking place in Platonic-Aristotelian thought from the position of Socrates, "that no one aims at what he knows to be bad." The stress that their psychology laid on the essential unity of the rational self that is the source of voluntary action prevented them from accepting Plato's analysis of the soul into a regulative element and elements needing regulation. They held that what we call passion is a morbid condition of the rational soul, involving erroneous judgment as to what is to be sought or shunned. From such passionate errors the truly wise man will of course be free. He will be conscious indeed of physical appetite; but he will not be misled into supposing that its object is really a good; he cannot, therefore, hope for the attainment of this object or fear to miss it, as these states involve the conception of it as a good. Similarly, though like other men he will be subject to bodily pain, this will not cause him mental grief or disquiet, as his worst agonies will not disturb his clear conviction that it is really indifferent to his true reasonable self.

That this impassive sage was a being not to be found among living men the later Stoics at least were fully aware. They faintly suggested that one or two moral heroes of old time might have realized the ideal, but they admitted that all other philosophers (even) were merely in a state of progress towards it. This admission did not in the least diminish the rigour of their demand for absolute loyalty to the exclusive claims of wisdom. The assurance of its own unique value that such wisdom involved they held to be an abiding possession for those who had attained it; 3 and without this assurance no act could be truly wise or virtuous. Whatever was not of knowledge was of sin; and the distinction between right and wrong being absolute and not admitting of degrees all sins were equally sinful; whoever broke the least commandment was guilty of the whole law. Similarly, all wisdom was somehow involved in any one of the manifestations of wisdom, commonly distinguished as particular virtues; though whether these virtues were specifically distinct, or only the same knowledge in different relations, was a subtle question on which the Stoics do not seem to have agreed.

Aristotle had already been led to attempt a refutation of the Socratic identification of virtue with knowledge; but his attempt had only shown the profound difficulty of attacking the paradox, so long as it was admitted that no one could of deliberate purpose act contrary to what seemed to him best. Now, Aristotle's divergence from Socrates had not led him so far as to deny this; while for the Stoics who had receded to the original Socratic position, the difficulty was still more patent. This theory of virtue led them into two dilemmas. Firstly, if virtue is knowledge, does it follow that vice is involuntary? If not, it must be that ignorance is voluntary. This alternative is the less dangerous to morality, and as such the Stoics chose it. But they were

1 There is a certain difficulty in discussing Aristotle's views on the subject of practical wisdom, and on the relation of the intellect to moral action, since it is most probable that the only accounts that we have of these views are not part of the genuine writings of Aristotle. Still books vi. and vii. of the Nicomachean Ethics contain no doubt as pure Aristotelian doctrine as a disciple could give, and appear to supply a sufficient foundation for the general criticism expressed in the text.

2 It has been suggestively said that Cynicism was to Stoicism what monasticism was to early Christianity. The analogy, however, must not be pressed too far, since orthodox Stoics do not ever seem to have regarded Cynicism as the more perfect way.

3 The Stoics were not quite agreed as to the immutability of virtue, but they were agreed that, when once possessed, it could only be lost through the loss of reason itself.
not yet at the end of their perplexities; for while they were thus driven to an extreme extension of the range of human volition, the view of the physical universe involved an equally thorough-going determinism. How could the vicious man be responsible if his vice were strictly pre-determined? The Stoics answered that the error which was the essence of vice was so far voluntary that it could be avoided if men chose to exercise their reason. No doubt it depended on the innate force and firmness\(^1\) of a man's soul whether his reason was effectively exercised; but moral responsibility was saved if the vicious act proceeded from the man himself and not from any external cause.

With all this we have not ascertained the positive practical content of this wisdom. How are we to emerge from the barren circle of affirming (1) that wisdom is the sole good and unwisdom the sole evil, and (2) that wisdom is the knowledge of good and evil; and attain some method for determining the particulars of good conduct? The Cynics made no attempt to solve this difficulty; they were content to mean by virtue what any plain man meant by it, except in so far as their sense of independence led them to reject certain received precepts and prejudices. The Stoics, on the other hand, not only worked out a detailed system of duties—or, as they termed them, "things meet and fit (καθευδοτα) for all occasions of life; they were further especially concerned to comprehend them under a general formula. They found this by bringing out the positive significance of the notion of Nature, which the Cynic had used chiefly in a negative way, as an antithesis to the "consentions" (δυνατον), from which his knowledge had made him free. Even in this negative use of the notion it is necessarily implied that whatever active tendencies in man are found to be "natural"—that is, independent of and uncorrupted by social customs and conventions—will properly take effect in outward acts, but the adoption of "conformity to nature" as a general positive rule for outward conduct seems to have been due to the influence on Zeno of Academic teaching. Whence, however, can this authority belong to the natural, unless nature be itself an expression or embodiment of divine law and wisdom? The conception of the world, as organized and filled by divine thought, was common, in some form, to all the philosophies that looked back to Socrates as their founder,—some even maintaining that this thought was the sole reality. This pantheistic doctrine harmonized thoroughly with the Stoic view of human good; but being unable to conceive substance idealistically, they (with considerable aid from the system of Heraclitus) supplied a materialistic side to their pantheism,—conceiving divine thought as an attribute of the purest and most primary of material substances, a subtle vital principle. This theological view of the physical universe to man as the "rational animal," may be understood both as directing that reason is to govern, and as indicating how that government is to be practically exercised. In man, as in every other animal, from the moment of birth natural impulse prompts to the maintenance of his physical frame; then, when reason has been developed and has recognized itself as its own sole good, these "primary ends of nature" and whatever promotes these still constitute the outward objects at which reason is to aim; there is a certain value (δεξια) in them, in proportion to which they are "preferred" (εξοργυμαι) and their opposites "rejected" (ἀποργυμαι); indeed it is only in the due and consistent exercise of such choice that wisdom can find its practical manifestation. In this way all or most of the things commonly judged to be "goods"—health, strength, wealth, fame, &c.,—are brought within the sphere of the sage's choice, though his real good is solely in the wisdom of the choice, and not in the thing chosen.

The doctrine of conformity to Nature as the rule of conduct was not peculiar to Stoicism. It is found in the theories of Speusippus, Xenocrates, and also to some extent in those of the Peripatetics. The peculiarity of the Stoics lay in their refusing to use the terms "good and evil" in connexion with "things indifferent," and in pointing out that philosophers, though independent of these things, must yet deal with them in practical life.

So far we have considered the "nature" of the individual man as apart from his social relations; but the sphere of virtue, as commonly conceived, lies chiefly in these, and this was fully recognized in the Stoic account of duties (καθευδοτα); indeed, in their exposition of the "natural" basis of justice, the evidence that man was born not for himself but for mankind is the most important part of their work in the region of practical morality. Here, however, we especially notice the double significance of "natural," as applied to (1) what actually exists everywhere or for the most part, and (2) what would exist if the original plan of man's life were fully carried out; and we find that the Stoics have not clearly harmonized the two elements of the notion. That man was "naturally" a social animal Aristotle had already taught; that all rational beings, in the unity of the reason that is common to all, form naturally one community with a common law was (as we saw) an immediate inference from the Stoic conception of the universe as a whole. That the members of this "city of Zeus" should observe their contracts, abstain from mutual harm, combine to protect each other from injury, were obvious points of natural law; while again, it was clearly necessary to the preservation of human society that its members should form sexual unions, produce children, and bestow care on them in rearing and training. But beyond this nature did not seem to go in determining the relations of the sexes according to us. We find that community of wives was a feature of Zeno's ideal commonwealth, just as it was of Plato's; while, again, the strict theory of the school recognized no government or laws as true or binding except those of the sage; he alone is the true ruler, the true king. So far, the Stoic "nature" seems in danger of being as revolutionary as Rousseau's. Practically, however, this revolutionary aspect of the notion was kept for the most part in the background; the rational law of an ideal community was not distinguished from the positive ordinances and customs of actual society; and the "natural" ties that actually bound each man to family, kinsmen, fatherland, and to unwise humanity generally, supplied the outline on which the external manifestation of justice was delineated. It was a fundamental maxim that the sage was to take part in public life; and it does not appear that his political action was to be regulated by any other principles than those commonly accepted in his community. Similarly, in the view taken by the Stoics of the duties of social decorum, and in their attitude to the popular religion, we find a fluctuating compromise between the disposition to repudiate what is conventional, and the disposition to revere what is so.\(^2\)

\(^{1}\) Hence some members of the school, without rejecting the definition of virtue = knowledge, also defined it as "strength and force."\(^3\)

\(^{2}\) It is apparently in view of this union in reason of rational beings that friends are allowed to be "external goods" to the sage, and that the possession of good children is also counted a good.

\(^{3}\) The Stoics seem to have varied in their view of "good repute," εὔδοξία; at first, when the school was more under the influence of Cynicism, they professed an outward as well as an inward indifference to it; ultimately they conceded the point to common sense, and included it among προγυμνα.
In the fundamental principle of his philosophy Epicurus is not original. Epicurus (cf. also Plato in the Protagoras and Eudoxus) had already maintained that pleasure is the sole ultimate good, and pain the sole evil; that no pleasure is to be rejected except for its painful consequences, and no pain to be chosen except as a means to greater pleasure; that the stringency of all laws and customs depends solely on the legal and social penalties attached to their violation; that, in short, all virtuous conduct and all speculative activity are empty and useless, except as contributing to the pleasantness of the agent's life. And Epicurus assures us that he means by pleasure what plain men mean by it; and that if the gratifications of appetite and sense are discarded, the notion is emptied of its significance. So far the system would seem to suit the inclinations of the most thorough-going voluntary. The originality of Epicurus lay in his theory that the highest point of pleasure, whether in body or mind, is to be attained by the mere removal of pain or disturbance, after which pleasure admits of variation only and not of augmentation; that therefore the utmost gratification of which the body is capable may be provided by the simplest means, and that "natural wealth" is no more than any man can earn. When further he teaches that the attainment of happiness depends almost entirely upon insight and right calculation, fortune having very little to do with it; that the pleasures and pains of the mind are far more important than those of the body, owing to the accumulation of feeling caused by memory and anticipation; and that an indispensable condition of mental happiness lies in relieving the mind of all superstitions, which can be effected only by a thorough knowledge of the physical universe—he introduces an ample area for the exercise of the philosophic intellect. So again, in the stress that he lays on the misery which the most secret wrong-doing must necessarily cause from the perpetual fear of discovery, and in his exuberant exaltation of the value of disinterested friendship, he shows a sincere, though not completely successful, effort to avoid the offence that consistent egoistic hedonism is apt to give to ordinary human feeling. As regards friendship, Epicurus was a man of peculiarly unexclusive sympathy. 1 The genial fellowship of the philosophic community that he collected in his garden remained a striking feature in the traditions of his school; and certainly the ideal which Stoics and Epicureans equally cherished of a brotherhood of sages was most easily realized on the Epicurean plan of withdrawing from political and dialectical conflict to simple living and serene leisure, in imitation of the gods apart from the fortuitous converse of atoms that we call a world. No doubt it was rather the practical than the theoretical side of Epicureanism which gave it so strong a hold on succeeding generations.

The two systems that have just been described were those that most prominently attracted the attention of the ancient world, so far as it was directed to ethics, from their almost simultaneous origin to the end of the 2nd century A.D., when Stoicism almost vanishes from our view. But side by side with them the schools of Plato and Aristotle still maintained a continuity of tradition, and a more or less vigorous life; and philosophy, as a recognized element of Graeco-Roman culture, was understood to be divided among these four branches. The internal history, however, of the four schools was very different. We find no development worthy of notice in Aristotelian ethics (see Peripatetics). The Epicureans, again, from their unquestioning acceptance of the "dogmas" 2 of their founder, almost deserve to be called a sect rather than a school. On the other hand, the changes in Stoicism are very noteworthy; and it is the more easy to trace them, as the only original writings of this school which we possess are those of the later Roman Stoics. These changes may be attributed partly to the natural inner development of the system, partly to the reaction of the Roman mind...

1 It is noted of him that he did not disdain the co-operation either of women or of slaves in his philosophical labours.
2 The last charge of Epicurus to his disciples is said to have been, ἔννομας μειμηθεῖν.
on the essentially Greek doctrine which it received.—a reaction all the more inevitable from the very affinity between the Stoic sage and the ancient Roman ideal of manliness. It was natural that the earlier Stoics should be chiefly occupied with delineating the inner and outer characteristics of ideal wisdom and virtue, and that the gap between the ideal sage and the actual philosopher, though never ignored, should yet be somewhat overlooked. But when the question "What is man's good?" had been answered by an exposition of perfect wisdom, the practical question "How may a man emerge from the folly of the world, and get on the way towards wisdom?" naturally attracted attention; and the preponderance of moral over scientific interest, which was characteristic of the Roman mind, gave this question especial prominence. The sense of the gap between theory and fact gives to the religious element of Stoicism a new force; the soul, conscious of its weakness, leaned on the thought of God, and in the philosopher's attitude towards external events, pious resignation preponderates over self-poise indifference; the old self-reliance of the reason, looking down on man's natural life as a mere field for its exercise, makes room for a positive aversion to the flesh as an alien element imprisoning the spirit; the body has come to be a "corpse which the soul sustains," and life a "sojourn in a strange land"; in short, the ethical idealism of Zeno has begun to borrow from the metaphysical idealism of Plato.

In no one of these schools was the outward coherence of tradition so much strained by inner changes as it was in Plato's. The alterations, however, in the metaphysical position of the Academicians had little effect on their ethical teaching, as, even during the period of Scepticism, they appear to have presented as probable the same general view of human good which Antiochus afterwards dogmatically announced as a revival of the common doctrine of Plato and Aristotle. And during the period of a century and a half between Antiochus and Plutarch, we may suppose the school to have maintained the old controversy with Stoicism on much the same ground, accepting the formula of "life according to nature," but demanding that the "good" of man should refer to his nature as a whole, the good of his rational part being the chief element, and always preferable in case of conflict, but yet not absolutely his sole good. In Plutarch, however, we see the same tendencies of change that we have noticed in later Stoicism. The conception of a normal harmony between the higher and lower elements of human life has begun to be disturbed, and the side of Plato's teaching that deals with the inevitable imperfections of the world of concrete experience becomes again prominent. For example, we find Plutarch amplifying the suggestion in Plato's latest treatise (the Laws) that this imperfection is due to a bad world-soul that strives against the good,—a suggestion which is alien to the general tenor of Plato's doctrine, and had consequently been unnoticed during the intervening centuries. We observe, again, the value that Plutarch attaches, not merely to the sustainment and consolation of rational religion, but to the supernatural communications vouchsafed by the divinity to certain human beings in dreams, through oracles, or by special warnings, like those of the geniuses of Socrates. For these flashes of intuition, he holds, the soul should be prepared by tranquil repose and the subjugation of sensuality through abstinence. The same ascetic effort to attain by aloofness from the body a pure receptivity for supernatural influences, is exhibited in Neo-Platonicism. But the general tendency that we are noting did not find its full expression in a reasoned system until the Egoistic. The system of Plotinus (205-270 A.D.) is a striking development of that element of Platonism which has had most fascination for the medieval and even for the modern mind, but which had almost vanished out of sight in the controversies of the post-Aristotelian schools. At the same time the differences are the more noteworthy from the reverent adhesion which the Neoplatonists always maintain to Plato. Plato identified good with the real essence of things; 1 Epictetus, 2 Marcus Aurelius.

with that in them which is definitely conceivable and knowable. It belongs to this view to regard the imperfection of things as devil of real being, and so incapable of being definitely thought or known; accordingly, we find that Plato has no technical term for that in the concrete sensible world which hinders it from perfectly expressing the abstract ideal world, and which in Aristotle's system is distinguished as absolutely formless matter (a dunamis). And so, when we pass from the ontology to the ethics of Platonism, we find that, though the highest life is only to be realized by turning away from concrete human affairs and their material environment, still the sensible world is not yet an object of positive moral aversion; it is rather something which the philosopher is seriously concerned to make as harmonious, good and beautiful as possible. But in Neoplatonism the inferiority of the condition in which the embodied human soul finds itself is more intensely and painfully felt; hence an express recognition of formless matter (a dunamis) as the "first evil," from which is derived the "second evil," body (soma), to whose influence all the evil in the soul's existence is due. Accordingly the ethics of Plotinus represent, we may say, the moral idealism of the Stoics cut loose from nature. The only good of man is the pure existence of the soul, which in itself, apart from the contagion of the body, is perfectly free from error or defect; if only it can be restored to the untrammelled activity of its original being, nothing external, nothing bodily, can positively impair its perfect welfare. It is only the lowest form of virtue—the "civic" virtue of Plato's Republic—that is employed in regulating those animal impulses whose presence in the soul is due to its mixture with the body; higher or philosophic wisdom, temperance, courage and justice are essentially purifications from this contagion; until finally the highest mode of goodness is reached, in which the soul has no community with the body, and is entirely turned towards reason. It should be observed that Plotinus himself is still too Platonist to hold that the absolute mortification of natural bodily appetites is required for purifying the soul; but this ascetic inference was drawn to the fullest extent by his disciple Porphyry.

There is, however, a yet higher point to be reached in the upward ascent of the Neoplatonist from matter; and here the divergence of Plotinus from Platonic idealism is none the less striking, because it is a bona fide result of reverent reflection on Plato's teaching. The cardinal assumption of Plato's metaphysics is, that the real is definitely thinkable and knowable in proportion as it is real; so that the further the mind advances in abstraction from sensible particulars and apprehension of real being, the more definite and clear its thought becomes. Plotinus, however, urges that, as all thought involves difference or duality of some kind, it cannot be the primary fact in the universe, any more than the body can be so in the soul. God. He must be an essential unity prior to this duality, a Being wholly without difference or determination; and, accordingly, the highest mode of human existence, in which the soul apprehends this absolute, must be one in which all definite thought is transcended, and all consciousness of self lost in the absorbing ecstasy. Porphyry tells us that his master Plotinus attained the highest state four times during the six years which he spent with him.

Neoplatonism, originally Alexandrine, is often regarded as Hellenistic rather than Hellenic, a product of the mingling of Greek with Oriental civilization. But however Oriental may have been the cast of mind that welcomed this theosophic asceticism, the forms of thought by which these views were philosophically reached are essentially Greek; and it is by a thoroughly intelligible process of natural development, in which the intensification of the moral consciousness represented by Stoicism plays an important part, that the Hellenic pursuit of knowledge culminates in a preparation for ecstasy, and the Hellenic idealization of man's natural life ends in a settled antipathy to the body and its works. At the same time we ought not to overlook the affinities between the doctrine of Plotinus and that remarkable combination of Greek and Hebrew thought which Philo Judaeus had expounded two centuries before; nor the fact that Neoplatonism was developed in

1 Epictetus. 2 Marcus Aurelius.
consciously antagonism to the new religion which had spread from Judea, and was already threatening the conquest of the Graeco-Roman world, and also to the Gnostic systems (see Gnosticism); nor, finally, that it furnished the chief theoretical support in the last desperate struggle that was made under Julian to retain the old polytheistic worship.

**B. Christianity and Medieval Ethics.**—In the present article we are not concerned with the origin of the Christian religion, nor with its outward history. Nor have we to consider the special doctrines that have formed the bond of union of the Christian communities except in their ethical aspect, their bearing on the systematization of human aims and activities. This aspect, however, must necessarily be prominent in discussing Christianity, which cannot be adequately treated merely as a system of theological beliefs divinely revealed, and special observances divinely sanctioned; for it claims to regulate the whole man, in all departments of his existence. It was not till the 4th century A.D. that the first attempt was made to offer a systematic exposition of Christian morality; and nine centuries more had passed away before a genuinely philosophic intellect, trained by a full study of Aristotle, undertook to give complete scientific form to the ethical doctrine of the Catholic church. Before, however, we take a brief survey of the progress of systematic ethics from Ambrose to Thomas Aquinas, it may be well to examine the chief features of the new moral consciousness that had spread through Graeco-Roman civilization, and was awaiting philosophic synthesis. It will be convenient to consider first the new form or universal characteristics of Christian morality, and afterwards to note the chief points in the matter or particulars of duty and virtue which received development or emphasis from the new religion.

The first point to be noticed is the new conception of morality as the positive law of a theocratic community possessing a written code imposed by divine revelation, and sanctioned by divine promises and threatenings. It is true that we find in ancient thought, from Socrates downwards, the notion of a law of God, eternal and immutable, partly expressed and partly obscured by the shifting codes and customs of actual human societies. But the sanctions of this law were vaguely and, for the most part, feebly imagined; their principles were essentially unwritten, and thus referred not to the external will of an Almighty Being who claimed unquestioning submission, but rather to the reason that gods and men shared, by the exercise of which alone they could be adequately known and defined. Hence, even if the notion of law had been more prominent than it was in ancient ethical thought, it could never have led to a juridical, as distinct from a philosophical, treatment of morality. In Christianity, on the other hand, we early find that the method of moralists determining right conduct is to a great extent analogous to that of jurisconsults interpreting a code. It is assumed that divine commands have been implicitly given for all occasions of life, and that they are to be ascertained in particular cases by interpretation of the general rules obtained from texts of scripture, and by inference from scriptural examples. Thus Christian ethics descended naturally from the Jewish theocracy, of which Christendom was a universalization. Moral insight, in the view of the most thoughtful Jews of the age immediately preceding Christianity, was conceived as knowledge of a divine code, emanating from an authority external to human reason which had only the function of interpreting and applying its rules. This law was derived partly from Moses, partly from the utterances of the later prophets, partly from oral tradition and from the commentaries and supplementary maxims of generations of students. Christianity inherited the notion of a written divine code acknowledged as such by the “true Israel”—now potentially including the whole of mankind, or at least the chosen of all nations,—on the sincere acceptance of which the Christian’s share of the divine promises to Israel depended. And though the ceremonial part of the old Hebrew code was altogether rejected, and with it all the supplementary jurisprudence resting on tradition and erudite commentary, still God’s law was believed to be contained in the sacred books of the Jews, supplemented by the teaching of Christ and his apostles. By the recognition of this law the church was constituted an ordered community, essentially distinct from the State; the distinction between the two was emphasized by the withdrawal of the early Christians from civic life, to avoid the performance of idolatrous ceremonies imposed as official expressions of loyalty, and by the persecutions which they had to endure, when the spread of an association apparently so hostile to the framework of ancient society had at length alarmed the imperial government. Nor was the distinction obliterated by the recognition of Christianity as the state religion under Constantine.

Thus the jural form in which morality was conceived only emphasized the fundamental difference between it and the laws of the state. The ultimate sanctions of the moral code were the infinite rewards and punishments awaiting the immortal soul hereafter; but the church early felt the necessity of withdrawing the privileges of membership from apostates and allowing them to be gradually regained only by a solemn ceremonial expressive of repentance, protracted through several years. This formal anathema or “penance” was extended from apostasy to other grave—or, as they were subsequently called, “deadly”—sins; while for minor offences all Christians were called upon to express contrition by fasting and abstinence from ordinarily permitted pleasures, as well as verbally in public and private devotions. “Excommunication” and “penance” thus came to be temporal ecclesiastical sanctions of the moral law. As the graduation of these sanctions naturally became more minute, a correspondingly detailed classification of offences was rendered necessary, and thus a system of ecclesiastical jurisprudence was gradually produced, somewhat analogous to that of Judaism. At the same time this tendency to make prominent a scheme of external duties has always been counteracted in Christianity by the remembrance of its original antithesis to Jewish legalism. We find that this antithesis, as exaggerated by some of the Gnostic sects of the 2nd and 3rd centuries A.D., led, not merely to theoretical antinomianism, but even if the changes of their orthodox opponents was not entirely to be discredited) to gross immorality of conduct. A similar tendency has shown itself at other periods of church history. And though such antinomianism has always been sternly repudiated by the moral consciousness of Christendom, it has never been forgotten that “inwardness,” rightness of heart or spirit, is the preeminent characteristic of Christian goodness. It must not, of course, be supposed that the need of something more than mere fulfillment of external duty was ignored even by the later Judaism. Rabbinic erudition could not forget the repression of vicious desires in the tenth commandment, the stress laid in Deuteronomy on the necessity of service to God, or the inculcation by later prophets of humility and faith. “The real and only Pharisee,” says the Talmud, “is he who does the will of his Father because he loves Him.” But it remains true that the contrast with the “righteousness of the scribes and Pharisees” has always served to mark the requirement of “inwardness” as a distinctive feature which Christianity would reject, rather than merely negative, tending to the repression of vicious desires as well as vicious acts, but also involving a positive rectitude of the inner state of the soul.

In this aspect Christianity invites comparison with Stoicism, and indeed with pagan ethical philosophy generally, if we except the hedonistic schools. Rightness of purpose, preference of virtue for its own sake, suppression of vicious desires, were made essential points by the Stoics, to whom all outward things were indifferent. The fundamental differences between pagan and Christian ethics depend not on any difference in the value set on rightness of heart, but on different views of the essential form or conditions of this inward rightness. In neither case is it presented purely and simply as moral rectitude. By the pagan philosophers it was always conceived under the form of Knowledge or Wisdom,
it being inconceivable to all the schools sprung from Socrates that a man could truly know his own good and yet deliberately choose anything else. This knowledge, as Aristotle held, might be permanently precluded by vicious habits, or temporarily obliterated by passion, but if present in the mind it must produce
to this purpose. Or even if it were held with some of the Stoics that true wisdom was out of the reach of the best men actually living, it none the less remained the ideal condition of perfect human life. By Christian teachers, on the other hand, the inner springs of good conduct were generally conceived as

Faith and Love. Of these notions the former has a somewhat complex ethical import; it seems to blend several elements differently prominent in different minds. Its simplest and commonest meaning is that emphasized in the contrast of “faith” with “sight”; where it signifies belief in the invisible divine order represented by the church, in the actuality of the law, the threats, the promises of God, in spite of all the influences in man’s natural life that tend to obscure this belief. Out of this contrast there ultimately grew an essentially different opposition between faith and knowledge or reason, according to which the theological basis of ethics was contrasted with the philosophical; the theologians maintaining sometimes that the divine law is essentially arbitrary, the expression of will, not reason; more frequently that its reasonableness is inscrutable, and that actual human reason should confine itself to examining the credentials of God’s messengers, and not the message itself. But in early Christianity this latter antithesis was as yet undeveloped; faith means simply force in clinging to moral and religious conviction, whatever their rational grounds may be; this force, in the Christian consciousness, being inseparably bound up with personal loyalty and trust towards Christ, the leader in the battle with evil, the ruler of the kingdom to be realized. So far, however, there is no ethical difference between Christian faith and that of Judaism, or its later imitation, Mahomedanism; except that the personal conviction of loyalty in Christ is peculiarly strong. The blending of human and divine natures in Christ, and the rule of duty impressively taught by the manifestation of his perfect life. A more distinctively Christian, and a more deeply moral, significance is given to the notion in the antithesis of “faith” and “works.” Here faith means more than loyal acceptance of the divine law and reverent trust in the lawgiver; it implies a consciousness, at once continually present and continually transcended, of the radical imperfection of all human obedience to the law, and at the same time the irrepressible condemnation which this imperfection entails. The Stoic doctrine of the worthlessness of ordinary human virtue, and the stern paradox that all offenders are equally, in so far as all are absolutely, guilty, find their counterparts in Christianity; but the latter (maintaining this ideal severity in the moral standard, with an emotional consciousness of what is involved in it quite unlike that of the Stoic) overcomes its practical exclusiveness through faith. This faith, again, may be conceived in two modes, essentially distinct though usually combined. In one view it gives the believer strength to attain, by God’s supernatural aid or “grace,” a goodness of which he is naturally incapable; in the other view it gives him an assurance that, though he knows himself a sinner deserving of utter condemnation, a perfectly just God still regards him with favour on account of the perfect services and suffering of Christ. Of these views the former is the more catholic, more universally present in the Christian consciousness; the latter more deeply penetrates the mystery of the Atonement, as expounded in the Pauline epistles.

But faith, however understood, is rather an indispensable pre-requisite than the essential motive principle of Christian

Love. This motive is supplied by the other central notion, love. On love depends the “fulfilling of the law,” and the sole moral value of Christian duty—that is, on love to God, in the first place, which in its fullest development must spring from Christian faith; and, secondly, love to all mankind, as the objects of divine love and sharers in the humanity ennobled by the incarnation. This derivative philanthropy characterizes the spirit in which all Christian performance of social duty is to be done; loving devotion to God being the fundamental attitude of mind that is to be maintained throughout the whole of the Christian’s life. But further, as regards abstinence from unlawful acts and desires prompting to them, we have to notice another form in which the inwardness of Christian morality manifests itself, which, though less distinctive, should yet receive attention in any comparison of Christian ethics with the view of Graeco-Roman philosophy. The profound horror with which the Christian’s conception of a suffering as well as an avenging divinity tended to make him regard all condemnable acts was tinged with a sentiment which we may perhaps describe as a ceremonial aversion moralized—the aversion, that is, to foulness or impurity. In Judaism, as in other, especially Oriental, religions, the natural dislike of material defilement has been elevated into a religious sentiment, and made to support a complicated system of quasi-sanitary abstinences and ceremonial purifications; then, as the ethical element predominated in the Jewish religion, a moral symbolism was felt to reside in the ceremonial code, and thus aversion to impurity came to be a common form of the ethical-religious sentiment. Then, when Christianity threw off the Mosaic ritual, this religious sense of purity was left with no other sphere besides morality; while, from its highly idealized character, it was peculiarly well adapted for that repression of vicious desires which Christianity claimed as its special function.

The distinctive features of Christian ethics are obedience, unworldliness, benevolence, purity and humility.

1. Distinctive particulars of Christian morality.

2. Again, the opposition between the natural world and the spiritual order into which the Christian has been born anew led not merely to a contempt equal to that of the Stoic for wealth, fame, power, and other objects of worldly pursuit, but also, for some time at least, to a comparative depreciation of the domestic and civic relations of the natural man. This tendency was exhibited most simply and generally in the earliest period of the church’s history. In the view of primitive Christians, the ordinary human society was a world temporarily surrendered to Satanic rule, over which a future judgment and utter destruction was impending; in such a world the little band who were gathered in the ark of the church could have no part or lot,—the only attitude they could maintain was that of passive alienation. On the other hand, it was difficult practically to realize this alienation, and a keen sense of this difficulty induced the same hostility to the body as a clog and hindrance, that we find to some extent in Plato, but more fully developed in Neoplatonism, Neopythagoreanism, and other products of the mingling of Greek with Oriental thought. This feeling is exhibited in the value set on fasting in the Christian church from the earliest times, and in an extreme form in the self-torments of later monasticism; while both tendencies, anti-worldliness and anti-sensualism, seem to have combined in causing the preference of celibacy over marriage which is common to most early Christian writers. Patriotism, again, and the sense of civic duty, the most elevated of all the social sentiments in the Graeco-Roman civilization, tended, under the influence of Christianity, either to expand itself into universal philanthropy, or to concentrate

1 E.g., Justin Martyr, Origen, Tertullian, Cyprian.
itself on the ecclesiastical community. “We recognize one commonwealth, the world,” says Tertullian; “we know,” says Origens, “that we have a fatherland founded by the word of God.” We might further derive from the general spirit of Christian unworldliness that repudiation of the secular modes of conflict, even in a righteous cause, which substituted a passive patience and endurance for the old pagan virtue of courage, in which the active element was prominent. Here, however, we clearly trace the influence of Christ’s express prohibition of violent resistance to violence, and his incarnation, by example and precept, of a love that was to conquer even natural resentment. An extreme result of this influence is shown in Tertullian’s view, that no Christian could properly hold the office of a secular magistrate in which he would have to doom to death, chains, imprisonment; but even more sober writers, such as Ambrose, extend Christian passivity so far as to preclude self-defense even against a murderous assault. The common sense of Christendom gradually shook off these extravagances; but the reluctance to shed blood lingered long, and was hardly extinguished even by the growing horror of heresy. We have a curious relic of this in the later times of ecclesiastical persecution, when the heretic was driven to the stake that he might be punished in some manner “short of bloodshed.”

3. It is, however, in the impulse given to practical beneficence in all its forms, by the exaltation of love as the root of all virtues, that the most important influence of Christianity on the particulars of civilized morality is to be found; although the exact amount of this influence is here somewhat difficult to ascertain, since it merely carries further a development traceable in the history of pagan morality. This development appears when we compare the different post-Socratic systems of ethics. In Plato’s exposition of the different virtues there is no mention whatever of benevolence, although his writings show a keen sense of the importance of friendship as an element of philosophic life, especially of the intense personal affection naturally arising between master and disciple. Aristotle goes somewhat farther in recognizing the moral value of friendship (φίλos); and though he considers that in its highest form it can be realized only by the fellowship of the wise and good, yet he extends the notion so as to include the domestic affections, as did in ancient times the idea of mutual kindness in binding together all human societies. Still in his formal statement of the different virtues, positive beneficence is discernible only under the notion of “liberalization,” in which form its excellence is hardly distinguished from that of graceful profusion in self-regarding expenditure (Nic. Eth. iv. 1). Cicero, on the other hand, in his paraphrase of a Stoic treatise on external duties (De officiis), ranks the rendering of positive services to other men as a chief department of social duty; and the Stoics generally recognized the universal fellowship and natural mutual claims of human beings as such. Indeed, this recognition in later Stoicism is sometimes expressed with so much warmth of feeling as to be hardly distinguishable from Christian philanthropy. Nor was this regard for humanity merely a doctrine of the school. Partly through the influence of Stoic and other Greek philosophy, partly from the natural expansion of human sympathies, the legislation of the Empire, during the first three centuries, shows a steady development in the direction of natural justice and humanity; and some similar progress may be traced in the general notion of moral opinion. Still the utmost that this development reached fell considerably short of the standard of Christian charity. Without dwelling on the immense impetus given to the practice of social duty generally by the religion that made beneficence a form of divine service, and identified “pity” with “piety,” we have to put down as definite changes introduced by Christianity—(1) the severe condemnation and final suppression of the practice of exposing infants; (2) effective abhorrence of the barbarism of gladiatorial combats; (3) immediate moral mitigation of slavery, and a strong encouragement of emancipation; (4) great extension of the eleemosynary provision made for the sick and the poor. As regards almsgiving, however—

---

attribution of all true human virtue to supernatural grace, as well as with the belief in divine foreknowledge. All we can say is that in the development of Christian thought the conflict of conceptions was far more profoundly felt, and far more serious efforts were made to evade or transcend it.

In the preceding account of Christian morality, it has been already indicated that the characteristics delineated did not all exhibit themselves simultaneously to the same extent, or with perfect uniformity throughout the church. Changes in the external condition of Christianity, the different degrees of civilization in the societies of which it was the dominant religion, and the natural process of internal development, continually brought different features into prominence; while again, the important antagonisms of opinion within Christendom frequently involved ethical issues—-even in the Eastern Church—until in the 4th century it began to be absorbed in the labour of a dogmatic construction. Thus, for example, the anti-secular tendencies of the new creed, to which Tertullian (200-220) gave violent and rigid expression, were exaggerated in the Montanist heresy which he ultimately joined; on the other hand, Clement of Alexandria, in opposition to the general tone of his age, maintained the value of pagan philosophy for the development of Christian faith into true knowledge (Gnosis), and the value of the natural development of man through marriage for the normal perfecting of the Christian life. So again, there is a marked difference between the writers before Augustine and those that succeeded him in all that concerns the internal conditions of Christian morality. By Justin and other apologists the need of redemption, faith, grace is indeed recognized, but the theological system depending upon these notions is not sufficiently developed to come into even apparent antagonism with the freedom of the will. Christianity is for the most part conceived as essentially a proclamation through the Divine Word, to immortal beings gifted with free choice; of the true code of conduct sanctioned by eternal rewards and punishments. This legalism contrasts strikingly with the efforts of pagan philosophy to exhibit virtue as its own reward; and the contrast is triumphantly pointed out by more than one early Christian writer. Lactantius (circa 300 A.D.), for example, roundly declares that Plato and Aristotle, referring everything to this earthly life, "made virtue mere folly"; though himself maintaining, with pardonable inconsistency, that man's highest good did not consist in mere pleasure, but in the consciousness of the filial relation of the soul to God. It is plain, however, that on this external legalistic view of duty it was impossible to maintain a difference in kind between Christian and pagan morality; the philosopher's conformity to the rules of chastity and beneficence, so far as it went, was indistinguishable from the saint's. But when this inference was developed in the teaching of Pelagius, it was repudiated as heretical by the church, under the powerful leadership of Augustine (354-430); and the doctrine of man's incapacity to obey God's law by his unaided moral energy was pressed to a point at which it was difficult to reconcile it with the freedom of the will. Augustine is fully aware of the theoretical indispensability of maintaining Free Will, from its logical connexion with human responsibility and divine justice; but he considers that these latter points are sufficiently secured if actual freedom of choice between good and evil is allowed in the single case of our progenitor Adam. For since the natura seminalis from which all men were to arise already existed in Adam, in his voluntary preference of self to God, humanity chose evil once for all; for which ante-natal guilt all men are justly condemned to perpetual absolute servil-

ness and consequent punishment, unless they are elected by God's unmerited grace to share the benefits of Christ's redemption. Without this grace it is impossible for man to obey the "first greatest commandment" of love to God; and, this unfulfilled, he is guilty of the whole law, and is only free to choose between degrees of sin; his apparent external virtues have no moral value, since inner righteousness of intention is wanting. "All that is not of faith is of sin"; and faith and love are mutually involved and inseparable; faith springs from the divinely imparted germ of love, which in its turn is developed by faith to its full strength, while from both united springs hope, joyful yearning towards ultimate perfect fruition of the object of love. These three Augustine (after St Paul) regards as the three essential elements of Christian virtue; along with these he recognizes the fourfold division of virtue into prudence, temperance, courage and justice according to their traditional interpretation; but he explains these virtues to be in their true natures only the same love to God in different aspects or exercises. The uncompromising mysticism of this view may be at once compared and contrasted with the philosophical severity of the Stoics. Love of God in the former holds the same absolute and unique position as the sole element of moral worth in human action, which, as we have seen, was occupied by knowledge of Good in the latter; and we may carry the parallel further by observing that in neither case is this severity in the abstract estimate of goodness necessarily connected with extreme rigidity in practical precepts. Indeed, an important part of Augustine's work as a moralist lies in the reconciliation which he laboured to effect between the anti-worldly spirit of Christianity and the necessities of secular civilization. For example, we find him arguing for the legitimacy of judicial punishments and military service against an over-literary interpretation of the Sermon on the Mount; and he took an important part in giving currency to the distinction between evangelical "counsels" and "commands," and so defending the life of marriage and temperate enjoyment of natural good against the attacks of the more extravagant advocate of celibacy and self-abnegation; although he fully admitted the superiority of the latter method of avoiding the contamination of sin.

The attempt to Christianize the old Platonic list of virtues, which we have noticed in Augustine's system, was probably due to the influence of his master Ambrose, in whose treatise De officiis ministrorum we find for the first time an exposition of Christian duty systematized on a plan borrowed from a pre-Christian moralist. It is interesting to compare Ambrose's account of what subsequently came to be known as the "four cardinal virtues" with the corresponding delineations in Cicero's De officiis which served the bishop as a model. Christian Wisdom, so far as it is speculative, of course primarily theological; it has God, as the highest truth, for its chief object, and is therefore necessarily grounded on faith. Christian Fortitude is essentially firmness in withstanding the seductions of good and evil fortune, resoluteness in the conflict perpetually waged against wickedness without carnal weapons—though Ambrose, with the Old Testament in his hand, will not quite relinquish the ordinary martial application of the term. Temperance retains the meaning of "observance of due measure" in all conduct, which is given in Cicero's treatise, though its notion is partly modified by being blended with the newer virtue of humility. Finally in the exposition of Christian Justice the Stoic doctrine of the natural union of all human interests is elevated to the full height and intensity of evangelical philanthropy; the brethren are reminded that the earth was made by God a common possession of all, and are bidden to administer their means for the common benefit; Ambrose, we should observe, is thoroughly aware of the fundamental union of these different virtues in Christianity, though he does not show the crudity of the notion of redemption in early Christianity, it is sufficient to mention that many fathers represent Christ's ransom as having been paid to the devil; sometimes adding that by the concealment of Christ's divinity under the veil of humanity a certain deceit was (fairly) practised on the great deceived.

It is to be observed that Augustine prefers to use "freedom" not for the power of willing either good or evil, but the power of willing good. The highest freedom, in his view, excludes the possibility of willing evil.  

1 Ethos's works are unimportant in the history of ancient ethics, as their philosophical matter was entirely borrowed from Greek treatises now lost; but the influence exercised by them (especially by the De officiis) over medieval and even modern readers was very considerable.
not, like Augustine, resolve them all into the one central affection of love of God.

Under the influence of Ambrose and Augustine, the four cardinal virtues furnished a basis on which the systematic ethical theories of subsequent theologians were built. With them the triad of Christian graces, Faith, Hope and Love, and the seven gifts of the Spirit (Isaiah xi. 2) were often combined. In antithesis to this list, an enumeration of the "deadly sins" obtained currency. These were at first commonly reckoned as eight; but a preference for mystical numbers characteristic of medieval theologians finally reduced them to seven. The statement of them is variously given.—Pride, Avarice, Anger, Gluttony, Unchastity, are found in all the lists; the remaining two (or three) are variously selected from among Envy, Vainglory, and the rather singular sins Gloominess (tristitia) and Languid Indifference (acedia), from Gr. ἀνεχία. These latter notions show plainly, what indeed might be inferred from a study of the list as a whole, that it represents the moral experience of the monastic life, which for some centuries was more and more unquestioningly regarded as in a peculiar sense "religious." It should be observed that the (Augustinian) distinction between "deadly" and "venial" sins had a technical reference to the quasi-jural administration of ecclesiastical discipline; which gradually more organized as the spiritual power of the church established itself amid the ruins of the Western empire, and slowly developed into the theocracy that almost dominated Europe during the latter part of the middle ages. "Deadly" sins were those for which formal ecclesiastical penance was held to be necessary, in order to save the sinner from eternal damnation; for "venial" sins he might obtain forgiveness, through prayer, almsgiving, and the observance of the regular fasts. We find that "penitential books" for the use of the confessional, founded partly on traditional practice and partly on the express decrees of synods, come into general use in the 7th century. At first they are little more than mere inventories of sins, with their appropriate ecclesiastical punishments; gradually cases of conscience come to be discussed and decided, and the basis is laid for that system of casuistry which reached its full development in the 14th and 15th centuries. This ecclesiastical jurisprudence, and indeed the general relation of the church to the wiles of the devil, which had to deal during this period, necessarily tended to encourage a somewhat external view of morality. But a powerful counterpoise to this tendency was continually maintained by the fervid inwardsness of August- 

Ecclesiastical morality in the "Dark Ages."

These at first commonly reckoned as eight; but a preference for mystical numbers characteristic of medieval theologians finally reduced them to seven. The statement of them is variously given.—Pride, Avarice, Anger, Gluttony, Unchastity, are found in all the lists; the remaining two (or three) are variously selected from among Envy, Vainglory, and the rather singular sins Gloominess (tristitia) and Languid Indifference (acedia), from Gr. ἀνεχία. These latter notions show plainly, what indeed might be inferred from a study of the list as a whole, that it represents the moral experience of the monastic life, which for some centuries was more and more unquestioningly regarded as in a peculiar sense "religious." It should be observed that the (Augustinian) distinction between "deadly" and "venial" sins had a technical reference to the quasi-jural administration of ecclesiastical discipline; which gradually more organized as the spiritual power of the church established itself amid the ruins of the Western empire, and slowly developed into the theocracy that almost dominated Europe during the latter part of the middle ages. "Deadly" sins were those for which formal ecclesiastical penance was held to be necessary, in order to save the sinner from eternal damnation; for "venial" sins he might obtain forgiveness, through prayer, almsgiving, and the observance of the regular fasts. We find that "penitential books" for the use of the confessional, founded partly on traditional practice and partly on the express decrees of synods, come into general use in the 7th century. At first they are little more than mere inventories of sins, with their appropriate ecclesiastical punishments; gradually cases of conscience come to be discussed and decided, and the basis is laid for that system of casuistry which reached its full development in the 14th and 15th centuries. This ecclesiastical jurisprudence, and indeed the general relation of the church to the wiles of the devil, which had to deal during this period, necessarily tended to encourage a somewhat external view of morality. But a powerful counterpoise to this tendency was continually maintained by the fervid inwardsness of August- 

Medieval moral philosophy.

In the pantheistic system of Erigena (q.v.) (circa 810-877) the chief philosophic element is supplied by the influence of Plato and Plotinus, transmitted through an unknown author of the 5th century, who assumed the name of Dionysius the Areopagite. Accordingly the ethical side of this doctrine has the same negative and ascetic character that we have observed in Neoplatonism. God is the only good; evil is essentially unreal and incognizable; the true aim of man's life is to return to perfect union with God out of the degraded material existence into which he has fallen. This doctrine found little acceptance among Erigena's contemporaries, and was certainly unorthodox enough to justify the condemnation which it subsequently received from Honorius III.; but its influence, together with that of the Pseudo-Dionysius, had a considerable share in developing the more emotional orthodox mysticism of the 12th and 13th centuries; and Neoplatonism (or Platonism received through a Neoplatonic tradition) remained a distinct element in medieval thought, though obscured in the period of mature scholasticism by the predominant influence of Aristotle. Passing on to Anselm (1033-1109), we observe that the Augustinian doctrine of original sin and man's absolute need of unmerited grace is retained in his theory of salvation; he also follows Augustine in defining freedom as the "power not to sin;" though in saying that Adam fell "spontaneously" and "by his free choice," though not "through its freedom," he has implicitly made the distinction that Peter the Lombard afterwards expressly draws between the freedom that is opposed to necessity and freedom from the slavery to sin. Anselm further softens the statement of Augustinian predestination by explaining that the freedom to will is not strictly lost even by fallen man; it is inherent in a rational nature, though since Adam's sin it only exists potentially in humanity, except where it is made actual by grace.

In a more real sense Abelard (1079-1142) tries to establish the connexion between man's ill desert and his free consent. He asserts that the inherited propensity to evil is not strictly a sin, which is only committed when the conscious self yields to vicious inclination. With a similar stress on the self-conscious side of moral action, he argues that willingness to perform depends solely on the intention, at one time pushing this doctrine to the paradoxical assertion that all outward acts as such are indifferent, and at another time the universalizing influence of ancient philosophy (which, however, he professed to admire) in the relation of which to Christianity he extravagantly misunderstood), he argues that the old Greek moralists, as incalculating a disinterested love of good—and so implicitly love of God as the highest good—were really nearer to Christianity than Judaic legalism was. Nay, further, he required that the Christian "love to God" should be regarded as pure only if purified from the self-regarding desire of the happiness which God gives. The general tendency of Abelard's thought was suspiciously regarded by contemporary orthodoxy; and the over-subtlety of the last-mentioned distinction provoked vehement replies from orthodox mystics of the age. Thus, Hugo of St Victor (1077-1141) argues that all love is necessarily so far "interested" that it involves a desire for union with the beloved; and since eternal happiness consists in this union, it cannot truly be desired apart from God; while Bernard of Clairvaux (1091-1153) more elaborately distinguishes four stages by which the soul is gradually led from (1) merely selfish love, through (2) love of God in distress, to (3) love for him based on his goodness, and at the (4) in rare moments this love for himself alone becomes the sole all-absorbing affection. This controversy between Peter the Lombard endeavoured to compose by the scholastic art of taking distinctions, of which he was a master. In his treatise, Libri sententiarum, mainly based on Augustine doctrine, we find a distinct softening of the antithesis between nature and grace and an anticipation of the union of Aristotelian and Christian thought, which was initiated by Albert the Great and completed by Thomas Aquinas.

The moral philosophy of Aquinas is Aristotelianism with a Neoplatonic tinge, interpreted and supplemented by a view of Christian dogma derived chiefly from Augustine. All action or movement of all things irrational as well as rational is directed towards some end or good,—that is, really and ultimately towards God himself, the ground and first cause of all being, and unmoved principle of all movement. This universal though unconscious striving after God, since he is essentially intelligible, exhibits itself in its highest form in rational beings as a "love of God,", which, though known, is, however, is beyond all ordinary exercise of reason, and may be only partially revealed to man here below. Thus the summum bonum for man is objectively God, subjectively the happiness to be derived from loving vision of his perfections; although there is a lower kind of happiness to be realized here

1 Abelard afterwards retracted this view, at least in its extreme form; and in fact does not seem to have been fully conscious of the difference between (1) unfulfilled intention to do an act objectively right, and (2) intention to do what is merely believed by the agent to be right.

2 He was condemned by two synods, in 1121 and 1140.
below in a normal human existence of virtue and friendship, with mind and body sound and whole and properly trained for the needs of life. The higher happiness is given to man by free grace of God; but it is given to those only whose heart is right, and as reward of virtuous actions. Passing to consider what actions are virtuous, we first observe generally that the morality of an act is in part, but only in part, determined by its particular motive; it partly depends on its external object and circumstances, which render it either objectively in harmony with the “order of reason” or the reverse. In the classification of particular virtues and vices we can distinguish very clearly the elements supplied by the different teachings which Aquinas has imbibed. He follows Aristotle closely in dividing the “natural” virtues into intellectual and moral, giving his preference to the former class, and the intellectual again into speculative and practical; in distinguishing within the speculative class the “intellect” that is conversant with principles, the “science” that deduces conclusions, and the “wisdom” to which belongs the whole process of knowing the sublimest objects of knowledge; and in treating practical wisdom as inseparably connected with moral virtues, and therefore in a sense moral. His distinction among moral virtues of the justice that renders others their due from the virtues that control the appetites and passions of the agent himself, represents the older Aristotelian interpretation of Ethica, while his account of those latter virtues is a simple transcript of Aristotle’s, just as his division of the non-rational part of the soul into “conscupible” and “irascible” is the old Platonic one. In arranging his list, however, he deviates from the established doctrine of the four cardinal virtues (derived from Plato and the Stoics through Cicero); accordingly, the Aristotelian ten have to stand under the higher genera of (1) the prudence which gives reasons of rules of conduct, (2) the temperance which restrains misleading desire, and (3) the fortitude that resists misleading fear of dangers or toils. But before these virtues are ranked the three “theologic” virtues, faith, love and hope, supernaturally “instilled” by God, and directly relating to him as their object. By faith we obtain that part of our knowledge of God which is beyond the range of mere natural wisdom or philosophy; naturally (e.g.), we can know God’s existence, but not his trinity in unity, though philosophy is useful to defend this and other revealed verities; and it is essential for the soul’s welfare that all articles of the Christian creed, however little they can be known by natural reason, should be apprehended through faith; the Christian who rejects a single article longs to hold together faith and of God. Faith is the substantial basis of all Christian morality, but without love—the essential form of all the Christian virtues—it is “formless” (“infirmis”). Christian love is conceived (after Augustine) as primarily love to God (beyond the natural yearning of the creature after its ultimate good), which expands into love towards all God’s creatures as created by him, and so ultimately includes even self-love. But creatures are only to be loved in their purity as created by God; all that is bad in them must be an object of hatred till it is destroyed. In the classification of sins the Christian element predominates; still we find the Aristotelian vices of excess and defect, along with the modern divisions into “sins against God, neighbour and self,” “mortal and venial sins,” and so forth.

From the notion of sin—treated in its juridical aspect—Aquinas passes naturally to the discussion of Law. The exposition of this conception presents to a great extent the same matter that was dealt with by the exposition of moral virtues, but in a different form; the prominence of which may perhaps be attributed to the growing influence of Roman jurisprudence which attained in the 12th century so rapid and brilliant a revival in Italy. This side of Thomas’s system is specially important, since it is just this blending of theological conceptions with the abstract theory of the later Roman law that gave the starting-point for independent ethical thought in the modern world. Under the general idea of law, defined as an “ordinance of reason for the common good, promulgated by him who has charge of the community,” Thomas distinguishes (1) the eternal law or regulative reason of God which embraces all his creatures, rational and irrational; (2) “natural law,” being that part of the eternal law that relates to rational creatures as such; (3) human law, which properly consists of more particular deductions from natural law particularized and adapted to the varying circumstances of actual communities; (4) divine law specially revealed to man. As regards natural law, he teaches that God has implanted in the human mind a knowledge of its immutable general principles; and not only knowledge, but a disposition, to which he applies the peculiar scholastic name “synderesis,” that unerringly prompts to the realization of these principles in conduct, and protests against their violation. All acts of natural virtue are implicitly included within the scope of this law of nature; but in the application of its principles to particular cases—to which the term “conscience” should be restricted—man’s judgment is liable to err, the light of being obscured and perverted by bad education and custom. Human law is required, not merely to determine the details for which natural law gives no intuitive guidance, but also to supply the force necessary for practically securing, among imperfect men, the observance of the most necessary rules of mutual behaviour. The rules of this law must be either deductions from principles already included in it or new and special. In the latter case, it leaves an indeterminate; a rule contrary to nature could not be valid as law at all. Human law, however, can deal with outward conduct alone, and natural law, as we have seen, is liable to be vague and obscure in particular applications. Neither natural nor human law, moreover, takes into account that supernatural happiness which is man’s highest end. Hence they need to be supplemented by a special revelation of divine law. This revelation is distinguished into the law of the old covenant and the law of the gospel; the latter of these is productive as well as imperative since it carries with it the divine grace that makes its fulfilment possible. We have, however, to distinguish in the case of the gospel between (1) absolute commands and (2) counsels,” which latter recommend, without positively ordering the monastic life of poverty, celibacy and obedience as the best method of effectually turning the will from earthly to heavenly things.

But how far is man able to attain either natural or Christian perfection? This is the part of Thomas’s system in which the cohesion of the different elements seems weakest. He is scarcely able to combine Aristotle and Christianity. This betrays at least two difficulties in dealing with this question: first, the old pagan difficulty of reconciling the proposition that will is a rational desire always directed towards apparent good, with the freedom of choice between good and evil that the juridical view of morality seems to require; and, secondly, the Christian difficulty of harmonizing this latter notion with the absolute dependence on divine grace which the religious consciousness affirms. The latter difficulty Thomas, like many of his predecessors, avoids by supposing a “co-operation” of free-will and grace, but the former he does not fully meet. It is against this part of his doctrines that the most important criticism, in ethics, of his rival Duns Scotus (c. 1266–1308) was directed. He urged that will could not be really free if it were bound to reason, as Thomas (after Aristotle) conceives it; a really free choice must be perfectly indeterminate between reason and unreason. Scotus consistently maintained that the divine will is similarly independent of reason, and that the divine ordering of the world is to be conceived as absolutely arbitrary. On this point he was followed by the acute intellect of William of Ockham (d. c. 1347). This doctrine is obviously hostile to all reasoned morality; and in fact, notwithstanding the dialectical ability of Scotus and Ockham, the work of Thomas remained indubitably the crowning result of the great constructive effort of medieval philosophy. The effort was, indeed, foredoomed to failure, since it attempted the impossible task of framing a coherent
system out of the heterogeneous data furnished by Scripture, the fathers, the church and Aristotle—equally unquestioned, if not equally venerated, authorities. Whatever philosophic quality is to be found in the work of Thomas belongs to it in spite of, not in consequence of, its method. Still, its influence has been great and long-enduring,—in the Catholic Church primarily, but indirectly among Protestants, especially in England, since the famous first book of Hooker’s Ecclesiastical Polity is to a great extent taken from the Summa theologiae.

Partly in conscious antagonism to the schoolmen, yet with close affinity to the central ethico-theological doctrine which they read out of or into Aristotle, the mystical manner of thought continued to maintain itself in the church. Philosophically it rested upon Neoplatonism, but its development in strict connexion with Christian orthodoxy begins in the 12th century with Bernard of Clairvaux and Hugo of St. Victor. It blended the Christian element of love with the ecstatic vision of Plotinus, sometimes giving the former a decided predominance. In its more moderate form, keeping wholly within the limits of ecclesiastical orthodoxy, this mysticism is represented by the Schoolmen; while it appears more independent and daringly constructive in the German Eckhart, advancing in some of his followers to open breach with the church, and even to practical immorality.

In the brief account above given of the general ethical view of Thomas Aquinas no mention has been made of the detailed discussion of particular duties included in the Summa theologiae; in which, for the most part, an excellent combination of moral elevation with sobriety of judgment is shown, though on certain points the scholastic pedantry of definition and distinction is unavailing to due delicacy of treatment. As the properly philosophic interest of scholasticism faded in the 14th and 15th centuries, the quasi-legal treatment of morality came again into prominence, borrowing a good deal of matter from Thomas and other schoolmen. One result of this was a marked development and systematization of casuistry. The best known Summae casuum conscientiae, compiled for the conduct of auricular confession, belong to the 14th and 15th centuries. The oldest, the Asessio, from Asti in Piedmont, is arranged as a kind of textbook of morality on a scholastic basis; later manuals are merely lists of questions and answers. It was inevitable that, in proportion as this casuistry assumed the character of a systematic penal jurisprudence, its precise determination of the limits between the prohibited and the allowable, with all doubtful points closely scrutinized and illustrated by fictitious cases, would have a tendency to weaken the moral sensibilities of ordinary minds; the greater the industry spent in deducing conclusions from the diverse authorities, the greater necessarily became the number of points on which doctors disagreed; and the central authority that might have repressed serious divergences was wanting in the period of moral weakness that the church went through after the death of Boniface VIII. A plain man perplexed by such disagreements might naturally hold that any opinion maintained by a pious and orthodox writer must be the safe one to follow; and thus weak consciences were subtly tempted to seek the support of authority for some desired relaxation of a moral rule. It does not, however, appear that this danger assumed formidable proportions until after the Reformation; in the struggle made by the Catholic Church to preserve a pure, sound, and uncorrupted system of morality, the principles of reason, of faith, and of charity, escape not only the intellect but the common sense of humanity.

The Jesuits. The foremost champions in this struggle, it seemed indispensable that the confessional should be made attractive; for this purpose ecclesiastico-moral law must be somewhat accommodated to worldly needs; and the theory of Probabilism supplied a plausible method for effecting this accommodation. The theory proceeded thus: A layman could not be expected to examine minutely into a point on which the learned differed; therefore he could not fairly be blamed for following any opinion that rested on the authority of even a single doctor; therefore his confessor must be authorized to hold him guiltless if any such “probable” opinion could be produced in his favour; nay, it was his duty to suggest such an opinion, even though opposed to his own, if it would relieve the conscience under his charge from a depressing burden. The results to which this Probabilism, applied with an earnest desire to avoid dangerous rigour, led in the 15th century were revealed to the world in the immortal Lettres provinciales of Pascal.

In tracing the development of casuistry we have been carried beyond the great crisis through which Western Christianity passed in the 16th century. The Reformations which Luther initiated may be viewed on several sides, even if we consider only its ethical principles and effects. It maintained the simplicity of Apostolic Christianity against the elaborate system of a corrupt hierarchy, the teaching of Scripture alone against the commentaries of the fathers and the traditions of the church, the right of private judgment against the dictation of ecclesiastical authority, the individual responsibility of every human soul before God in opposition to the papal control over purgatorial punishments, which had led to the revolting degradation of venal indulgences. Reviving the original antithesis between Christianity and Jewish legalism, it maintained the inwardness of faith to be the sole way to eternal life, in contrast to the outwardness of works; returning to Augustine, and expressing his spirit in a new formula, to resist the Neo-Pelagianism that had gradually developed itself within the apparent Augustinianism of the church, it maintained the total corruption of human nature, as contrasted with that “congruity” by which, according to the schoolmen, divine grace was to be earned; renewing the fervent humility of St Paul, it enforced the universal and absolute imperativeness of all Christian duties, and the inevitable unworthiness of all Christian obedience, in opposition to the theory that “condign” merit might be gained by “supero-ragatory” conformity to evangelical “counsel.” It will be seen that these changes, however profoundly important, were, ethically considered, either negative or quite general, relating to the tone and attitude of mind in which all duty should be done. As regards all positive matter of duty and virtue, and most of the prohibitive code for ordinary men, the tradition of Christian teaching was carried on substantially unchanged by the Reformed churches. Even the old method of casuistry was maintained during the 16th and 17th centuries; though Scriptural texts, interpreted and supplemented by the light of natural reason, now furnished the sole principles on which cases of conscience were decided. In the 17th century, however, the interest of this quasi-legal treatment of morality gradually faded; and the ethical studies of educated minds were occupied with the attempt, renewed after so many centuries, to find an independent philosophical basis for the moral code. The renewal of this attempt was only indirectly due to the Reformation; it is rather to be connected with the more extreme reaction from the medieval religion which was partly caused by, partly expressed in, that enthusiastic study of the remains of old pagan culture that invaded Italy over Europe in the 15th and 16th centuries. To this “humanism” the Reformation seemed at first more hostile than the Roman hierarchy; indeed, the extent to which this latter had allowed itself to become paganized by the Renaisance was one of the points that especially roused the Reformers’ indignation. Not the less important is the indirect stimulus given by the Reformation towards the development of a moral philosophy independent alike of Catholic and Protestant assumptions. Scholasticism, while reviving philosophy as a handmaid to theology, had metamorphosed its method into one resembling that of its mistress; thus shackling the renaissance intellectual
activity which it stimulated by the double bondage to Aristotle and to the church. When the Reformation shook the traditional authority in one department, the blow was necessarily felt in the other. Not twenty years after Luther’s defiance of the pope, the startling thesis “all that Aristotle taught was false” was prosperously maintained by the youthful Ramus before the university of Paris; and almost contemporaneously the group of remarkable thinkers in Italy who heralded the dawn of modern physical science—Cardanus, Telesio, Patrizi, Campanella, Bruno—began to propound their Aristotelian theories of the constitution of the physical universe. It was to be foreseen that a similar assertion of independence would make itself heard in ethics also; and, indeed, amid the clash of dogmatic convictions, and the variations of private judgment, it was natural to seek for an ethical method that might claim universal acceptance from all sects.

C. Modern Ethics.—The need of such independent principles was most strongly felt in the region of man’s civil and political relations, especially the mutual relations of communities. Accordingly we find that modern ethical controversy began in a discussion of the law of nature. Albericus Gentilis (1557–1612) and Hugo Grotius (1583–1645) were the first to give a systematic account. Natural law, according to Grotius and other writers of the age, is that part of divine law which follows from the essential nature of man, who is distinguished from animals by his “appetite” for tranquillization with his fellows, and his tendency to act on general principles. It is therefore as unalterable, even by God himself, as the truths of mathematics, although its effect may be stayed in any particular case by an express command of God; hence it is cognizable a priori, from the abstract consideration of human nature, though its existence may be known a posteriori also from its universal acceptance in human societies. The conception, as we have seen, was taken from the later Roman jurists; by them, however, the law of nature was conceived as something that underlay existing law, and was to be looked for through it, though it might ultimately supersede it, and in the meanwhile represented an ideal standard, by which improvements in legislation were to be guided. Still the language of the jurists in some passages (cf. Inst. of Justinian, ii. 1, 2) clearly implied a position of natural law as a distinct and independent law alone, prior to the institution of civil society. Posidonius had identified this period with the mythical “golden age”; and such ideas easily coalesced with the narrative in Genesis. Thus there had become current the conception of a “state of nature” in which individuals or single families lived side by side—under none other than those “natural” laws which prohibited mutual injury and interference in the free use of the goods of the earth common to all, and upheld parental authority, fidelity of wives, and the observance of compacts freely made. This conception Grotius took, and gave it additional force and solidity by using the principles of this natural law for the determiuation of international rights and duties, it being obvious that independent nations, in their corporate capacities, were still in that “state of nature” in their mutual relations. It was not, of course, assumed that these laws were universally obeyed; indeed, one point with which Grotius is especially concerned is the natural right of private war, arising out of the violation of more primary rights. Still a general observance was implicit in the idea of a natural law as a “factum of right reason indicating the agreement or disagreement of an act with man’s rational and social nature”; and we may observe that it was especially necessary to assume such a general observance in the case of contracts, since it was by an “express or tacit pact” that the right of property (as distinct from the mere right to non-interference during use) was held by him to have been instituted. A similar “fundamental pact” had long been generally regarded as the normal origin of legitimate sovereignty.

The ideas above expressed were not peculiar to Grotius; in particular the doctrine of the “fundamental pact” as the juridical basis of government had long been maintained, especially in England, where the constitution historically established readily suggested such a compact. At the same time the rapid and remarkable success of Grotius’ treatise (De jure belli et pacis) brought his view of Natural Right into prominence, and suggested such questions as—“What is man’s ultimate reason for obeying these laws? Wherein does this agreement with his rational and social nature consist? How far, and in what sense, is his nature really social?”

It was the answer which Hobbes (1588–1679) gave to these fundamental questions that supplied the starting-point for independent ethical philosophy in England. The nature of this answer was determined by the psychological views to which Hobbes had been led, possibly to some extent under the influence of Bacon,1 partly perhaps through association with his younger contemporary Gassendi, who, in two treatises, published between the appearance of Hobbes’ De cive (1642) and that of the Leviathan (1651), endeavoured to revive interest in Epicurus. Hobbes’ psychology is in the first place materialistic; he holds, that in any of the psycho-physical phenomena of human nature the reality is a material process of which the mental feeling is a mere “appearance.” Accordingly he regards pleasure as essentially motion “helping the body of the soul to live,” and pain as the “contraries.” There is in his mind a natural connexion between this theory and the doctrine that appetite of desire has always pleasure (or the absence of pain) for its object; but a materialist, framing a system of psychology, will naturally direct his attention to the impulses arising out of bodily needs, whose obvious end is the preservation of the agent’s organism; and this, together with a philosophic wish to simplify, may lead him to the conclusion that all human impulses are similarly self-regarding. This, at any rate, is Hobbes’ cardinal doctrine in moral psychology, that each man’s appetites or desires are naturally directed either to the preservation of his life, or to that heightening of it which he feels as pleasure.2 Hobbes does not distinguish instinctive from deliberate pleasure-seeking; and he confidently resolves the most apparently unselfish emotions into phases of self-regard. Pity he finds to be grief for the calamity of others, arising from imagination of the like calamity befalling oneself; what we admire with seeming disinterestedness as beautiful (pulchrum) is really “pleasure in promise”; when men are not immediately seeking profit, the only other motive is the mere pleasure, and thus have a derivative delight in the exercise of power that prompts to what we call benevolent action. Since, then, all the voluntary actions of men tend to their own preservation or pleasure, it cannot be reasonable to aim at anything else; in fact, nature rather than reason fixes this as the end of human action; it is reason’s function to show the means. Hence if we ask why it is reasonable for any individual to observe the rules of social behaviour that are commonly called moral, the answer is obvious that this is only indirectly reasonable, as a means to his own preservation or pleasure. It is not, however, in this, which is only the old Cyrenaic or Epicurean answer, that the distinctive point of Hobbes’ lies. It is rather in the doctrine that even this indirect reasonableness of the most fundamental moral rules is entirely conditional on their general observance, which cannot be secured apart from government. For example, it is not reasonable for me to perform my share of a contract, unless I have reason for believing that the other party will perform his; and this I cannot have, except in a society in which he will be punished for non-performance. Thus the ordinary rules of social behaviour are only hypothetically obligatory, they are actualized by the establishment of a “common power.”

1 This influence was not exercised in the region of ethics. Bacon’s brief outline of moral philosophy (in the Advancement of Learning, ii. 20–22) is highly pregnant and suggestive. But Bacon’s great task of reforming scientific method was one which, as he conceived it, left morals on one side; he never made any serious effort to reduce his ethical views to a coherent system, methodically based on an independent basis. The outline given in the Advancement was never filled in, and does not seem to have had any effect on the subsequent course of ethical speculation.

2 He even identifies the desire with the pleasure, apparently regarding the stir of appetite and that of fruition as two parts of the same “motion.”
that may "use the strength and means of all" to enforce on all the observance of rules tending to the common benefit. On the other hand Hobbes yields to no one in maintaining that personal right is paramount idea of moral relations. The precepts of good faith, equity, requital of benefits, forgiveness or wrong so far as security allows, the prohibition of contumely, pride, arrogance,—which may all be summed up in the formula, "Do not that to another which thou wou'dst not have done to thyself" (i.e. the negative of the "golden rule")—he still calls "immutable and eternal laws of nature"—meaning that, though a man is not unconditionally bound to realize them, he is, as a reasonable being, bound to desire that they should be realized. The pre-social state of man, in his view, is also pre-moral; but it is therefore utterly miserable. It is a state in which every one has a right to everything that may conduce to his preservation; but it is therefore also a state of war—a state so wretched that it is the first dictate of rational self-love to emerge from it into social peace and order. Hence Hobbes's ideal constitution naturally comes to be an unquestioned and unlimited—though not necessarily monarchical—despotism. Whatever the government declares to be just or unjust must be accepted as such, since to dispute its dictates would be the first step towards anarchy, the one paramount evil outweighing all particular defects in legislation. A doubt respecting the means used to understand, as well as to preserve, the crisis of 1640, when the ethico-political system of Hobbes first took written shape, a peace-loving philosopher should regard the claims of individual conscience as essentially anarchical, and dangerous to social well-being; but however strong might be men's yearning for order, a view of social duty, in which the only fixed positions were selfishness everywhere and unlimited power somewhere, could not but appear offensively paradoxical.

There was, however, in his theory an originality, a force, an apparent coherence which rendered it undeniably impressive; in fact, we find that for two generations the efforts to construct morality on a philosophical basis take more or less the form of answers to Hobbes. From an ethical point of view Hobism divides itself naturally into two parts, which by Hobbes's peculiar political doctrines are combined into a coherent whole, but are not otherwise necessarily connected. Its theoretical basis is the principle of egoism; while, for practically determining the particulars of duty it makes morality entirely dependent on positive law and institution. It thus affirmed the relativity of good or evil, or, in a double sense, good and evil for any individual citizen may from one point of view be defined as the objects respectively of his desire and his aversion; from another, they may be said to be determined for him by his sovereign. It is this latter aspect of the system which is primarily attacked by the first generation of writers that replied to Hobbes. This attack, or rather the counter-exposition of orthodox moral doctrine, is conducted on different methods by the Cambridge moralists and by Cumberland respectively. Cumberland is content with the legal view of morality, but endeavours to establish the validity of the laws of nature by taxing them on the single supreme principle of rational regard for the "common good of all," and showing them, as so based, to be adequately supported by the divine sanction. The Cambridge school, regarding morality primarily as a body of truth rather than a code of rules, insist on its absolute character and intuitive certainty.

Cudworth was the most distinguished of the little group of thinkers at Cambridge in the 17th century, commonly known as the Cambridge Platonists (q.v.). In his treatise on Eternal and Immortal Morality his main aim is to maintain the "essential and eternal distinctions of good and evil" as independent of mere will, whether human or divine. These distinctions he insists, have an objective reality, cognizable by reason no less than the relations of space or number; and he endeavours to refute Hobism—which he treats as a "novantique philosophy," a mere revival of the relativity of Protagoras—chiefly by the following argumentum ad hominem. He argues that Hobbes's atomic materialism involves the conception of an objective physical world, the object not of passive sense that varies from man to man, but of the active intellect that is the same in all; there is therefore, he urges, an inconsistency in refusing to admit a similar exercise of intellect in morals, and an objective world of right and wrong, which the mind by its normal activity clearly apprehends as such.

Cudworth, in the work above mentioned, gives no systematic exposition of the ethical principles which he holds to be thus intuitively apprehended. But we may supply this deficiency from the Enchiridion Ethicum of Henry More, another thinker of the same school. More gives a list of 23 Noemata Moralia, the truth of which will, he says, be immediately manifest. Some of these admit of a purely egotistic application, and appear to be so understood by the author—his particular desires. Others are qualified as well as in duration, and that the superior good or the lesser evil always preferred; that absence of a given amount of good is preferable to the presence of equivalent evil; that future good or evil is to be regarded as much as present, if equally certain, and nearly as much if very probable. Objections, both general and special, might be urged by a Hobquist against these modes of formulating man's natural pursuit of self-interest; but the serious controversy between Hobism and modern Platonism related not to such principles as these, but to others which demand from the individual a (real or apparent) sacrifice for his fellows. Such are the evangelical principle of "doing as you would be done by"; the principle of justice, or "giving every man his own, and letting him enjoy it without interference"; and especially what More states as the abstract formula of benevolence, that "if it be good that one man should be supplied with the means of living well and happily, it is mathematically certain that it is doubly good that two should be so supplied, and so on." The question, however, still remains, what motive any individual has to conform to these social principles when they conflict with his own desires. More gives no explicit reply, and the answer of More is hardly clear. On the one hand he maintains that these principles express an absolute good, which is to be called intellectual because its essence and truth are apprehended by the intellect. We might infer from this that the intellect, so judging, is itself the proper and complete determinant of the will, and that man, as a rational being, ought to aim at the realization of absolute good for its own sake. In spite, however, of possible inferences from his definition of virtue, this does not seem to be really More's view. He explains that though absolute good is discerned by the intellect, the "sweetness and flavour" of it is apprehended, not by the intellect proper, but by what he calls a "boniform faculty"; and it is in this sweetness and flavour that the motive to virtuous conduct lies; ethics is the "art of living well and happily," and true happiness lies in "the pleasure which the soul derives from the sense of virtue." In short, More's Platonism appears to be really as hedonistic as Hobism; only the feeling to which it appeals as ultimate motive is of a kind that only a mind of exceptional moral refinement can habitually feel with the decisive intensity required.

It is to be observed that though More lays down the abstract principle of regarding one's neighbour's good as much as one's own with the full breadth with which Christianity inculcates it, yet when he afterwards comes to classify virtues he is too much under the influence of Platonic-Aristotelian thought to give a distinct place to benevolence, except under the old form of liberality. In this respect his system presents a striking contrast to Cumberland's, whose treatise De Legibus Naturae

---

1 In spite of Hobbes's uncompromising egoism, there is a noticeable discrepancy between his theory of the ends that men naturally seek and his standard for determining their natural rights. This latter is never Pleasure simply, but always Preservation—though on occasion he enlarges the notion of "preservation" into "preservation of life so as not to be weary of it." His view seems to be that in a state of nature most men will fight, rob, &c., for delection merely or "for glory," and that hence all men must be allowed an indefinite right to fight, rob, &c., "for preservation."
ETHICS

(1672), though written like More's in Latin, is yet in its ethical
matter thoroughly modern. Cumberland is a thinker both original
and comprehensive, and, in spite of defects in style and
clarityness, he is noteworthy as having been the first to
lay down that "regard for the common good of all" is
the supreme rule of morality or law of nature. So far he may be
clearly considered as progenitor of later utilitarianism. His funda-
mental principle and supreme "Law of Nature" is thus stated:
"The greatest possible benevolence of every rational agent
towards all the rest constitutes the happiest state of each and
all, so far as depends on their own power, and is necessarily
required for their happiness; accordingly Common Good will
be the Supreme Good." It is, however, important to notice that
in his "good" is included not merely happiness but "perfection";
and he does not even define perfection so as to exclude from
it the notion of absolute moral perfection and save his theory
from an obvious logical circle. A notion so vague could not
possibly be used with any precision for determining the subordinate rules of morality; but in fact Cumberland does not
attempt this; his supreme principle is designed not to rectify,
but merely to support and systematize, common morality. This
principle, as was said, is conceived as strictly a law, and therefore
referred to a lawgiver, God, and proposed as universal in its
effects to all nations. That the divine will is expressed by it, Cumberland, "not being so fortunate as to
possess innate ideas," tries to prove by a long inductive examina-
tion of the evidences of man's essential sociality exhibited in his
physical and mental constitution. His account of the sanction,
again, is sufficiently comprehensive, including both the internal
and the external rewards of virtue and punishments of vice;
and he, like later utilitarians, explains moral obligation to lie
in the force exercised on the will by these sanctions; but as to
the precise manner in which individual is implicated with
universal good, and the operation of either or both in determi-
ning vocation, his view is indistinct if not actually inconsistent.

The clearness which we seek in vain from Cumberland is
found to the fullest extent in Locke, whose Essay on the Human
Understanding (1690) was already planned when

Cumberland's treatise appeared. Yet Locke's ethical
opinions have been widely misunderstood; since from a con-
fusion between "innate ideas" and "intuitions," which has been
common in recent ethical discussion, it has been supposed that
the founder of English empiricism is a metaphysician. This must be
hostile to "innate ideas." The truth is that, while Locke
agreed entirely with Hobbes as to the egoistic basis of rational
conduct, and the interpretation of "good" and "evil" as
"pleasure" and "pain," or that which is productive of pleasure
and pain, he yet agrees entirely with Hobbes's opponents in
holding ethical rules to be actually obligatory independently of
political society, and capable of being scientifically constructed
on principles intuitively known,—though he does not regard
these principles as implanted in the mind at birth. The aggregate
of such rules he conceives as the law of God, carefully distinguishing
it, not only from civil law, but from the law of opinion or
reputation, the varying moral standard by which men actually
distribute praise and blame; as being divine it is necessarily
sanctioned by adequate rewards and punishments. He does not, indeed, speak of the scientific construction of this code as having
been actually effected, but he affirms its possibility in language
remarkably strong and decisive. "The idea," he says, "of a
Supreme Being, infinite in power, goodness, and wisdom, whose
workmanship we are, and upon whom we depend, and the idea
of ourselves, as understanding rational beings, being such as are
clear in us; I would, I suppose, if I duly considered, afford such foundations of our duty and rules of action,
as might place morality among the sciences capable of demonstra-
tion; wherein, I doubt not, but from self-evident propositions,
by necessary consequences as incontestable as those in mathe-
nematics, the measure of right and wrong might be made out.
As Locke cannot consistently mean by God's "goodness"
anything but the disposition to give pleasure, it might be inferred
that the ultimate standard of right rules of action ought to be
the common happiness of the beings affected by the action;
but Locke does not expressly adopt this standard. The only
instances which he gives of intuitive moral truths are the purely
formal propositions, "No government allows absolute liberty," and
"Where there is no property there is no injustice,"—neither
of which has any evident connexion with the general happiness.
As regards his conception of the Law of Nature, he takes it
in the main immediately from Grotius and Pufendorf, more
remotely from the Stoics and the Roman jurists.

We might give, as a fair illustration of Locke's general con-
ception of ethics, a system which is frequently represented as
diametrically opposed to Lockism; namely, that
expounded in Clarke's Boyle lectures on the Being
and Attributes of God (1704). It is true that Locke is not particu-
larly concerned with the ethico-theological proposition which
Clarke is most anxious to maintain,—that the fundamental
rules of morality are independent of arbitrary will, whether
divine or human. But in his general view of ethical principles as
being, like mathematical principles, 1 essentially truths of relation,
Clarke is quite in accordance with Locke; while of the four
fundamental rules that he expounds, Piety towards God, Equity,
Benevolence and Sobriety (which includes self-preservation),
it must be observed that Clarke, as he suggests, by comparing the idea
of the idea of a man with the idea of a fellow creature, the man
being on whom he depends; and the second and third are
axioms self-evident on the consideration of the equality or
similarity of human individuals as such. The principle of equity
—that "whatever I judge reasonable or unreasonable for
another to do for me, that by the same I declare reasonable
or unreasonable that I in the like case should do for him," is
merely a formal statement of the golden rule of the gospel. We
may observe that, in stating the principle of benevolence, "since
the greater good is always most fit and reasonable to be done,
every rational creature ought to do all the good it can to its
fellow-creatures," Clarke avowedly follows Cumberland, from
whom he quotes the further sentence that "universal love and
benevolence is as plainly the most direct, certain and effectual
means to this good as the flowing of a point is to produce a line."
The quotation may remind us that the analogy between ethics
and mathematics ought to be traced further back than Locke;
in fact, it results from the influence exercised by Cartesianism
over English thought generally, in the latter half of the 17th
century. It may be worth noticing how well Clarke is fitted by the analogy
for the use general ethical terms ("fitness," "agreeable to
mindings," &c.), which overlook the essential distinction between what
is and what ought to be; and even in one or two expressions to
overlook this distinction extravagantly, as (e.g.) in saying that
the man who "wisely acts contrary to justice wills things to be
what they are not and cannot be." What he really means is
less paradoxically stated in the general proposition that "origin-
ally and in reality it is natural and (morally speaking) necessary
that the will should be determined in every action by the reason
of the thing and the right of the case, as it is natural and
(absolutely speaking) necessary that the understanding should
submit to a demonstrated truth." But though it is an essential
point in Clarke's view that what is right is to be done as such,
apart from any consideration of pleasure or pain, it is to be
inferred that he is not prepared to apply this doctrine in its
unqualified form to such a creature as man, who is partly under
the influence of irrational impulses. At least when he comes to
argue the need of future rewards and punishments we find that
his claim on behalf of morality is startlingly reduced. He
only contends that virtue deserves to be chosen for its
own sake and that the good man was sure for his own particular neither to gain nor lose anything by the practice
of either." He fully admits that the question is altered when
vice is attended by pleasure and profit to the vicious man, virtue
by loss and calamity; and even that it is "not truly reasonable
that men by adhering to virtue should part with their lives,

1 It should be noticed, however, that it is only in his treatment of Equity and Benevolence that he really follows out the mathematical
if thereby they deprived themselves of all possibility of receiving any advantage from their adherence.

Thus, on the whole, the impressive earnestness with which Clarke enforces the doctrine of rational morality only rendered more manifest the difficulty of establishing ethics on an independent philosophical basis; so long as at least the psychological egoism of Hobbes is not definitely assailed and overthrown. Until this is done, the utmost demonstration of the abstract reasonableness of social duty only leaves us with an irreconcilable antagonism between the view of abstract reason and the self-love which is allowed to be the root of man's appetitive nature. Let us grant that there is as much intellectual absurdity in acting unjustly as in denying that two and two make four; still, if a man has to choose between absurdity and unhappiness, he will naturally prefer the former; and Clarke, as we have already seen, is not really prepared to maintain that such preference is irrational.

It remains to try another psychological basis for ethical construction; instead of presenting the principle of social duty as abstract reason, liable to conflict to any extent with natural self-love, we may try to exhibit the naturalness of man's social affections, and demonstrate a normal harmony between these and his self-regarding impulses. This is the approach which Shaftesbury (1671-1713) may be said to have initiated. This theory had already been advanced by Cumberland and others, but Shaftesbury was the first to make it the cardinal point in his system: no one had yet definitely transferred the centre of ethical interest from the Reason, conceived as apprehending either abstract moral distinctions or laws of divine legislation, for the emotional impulses that prompt to social duty; no one had undertaken to distinguish clearly, by analysis of experience, the disinterested and self-regarding elements of our appetitive nature, or to prove inductively their perfect harmony. In his Inquiry concerning Virtue and Merit he begins by attacking the egoism of Hobbes, which, as we have seen, was not necessarily excluded by the doctrine of rational intuitions of duty. This interpretation, he says, would be true only if we considered man as a wholly unrelated individual. Such a being we might doubtless call "good," if his impulses were adapted to the attainment of his own felicity. But man we must and do consider in relation to a larger system of which he forms a part, and so we call him "good" only if his impulses and emotions are so balanced as to tend towards the good of this whole. And again we do not attribute goodness to him merely because his outward acts have beneficial results. When we speak of a man as good, we mean that his dispositions or affections are such as tend of themselves to promote the good or happiness of human society. Hobbes's moral man, who, if left loose from governmental constraint, would straightforwardly spread ruin among his fellows, is not what we commonly agree to call good. Moral goodness, then, in a "sensible creature" implies primarily disinterested affections, whose direct object is the good of others; but Shaftesbury does not mean (as he has been misunderstood to mean) that only such benevolent social impulses are good, and that these are always good. On the contrary, he is careful to point out, first, that immoderate social affections defeat themselves, miss their proper end, and are therefore bad; secondly, that as an individual's good is part of the good of the whole "self-affections" existing in a duly limited degree are morally good. Goodness, in short, consists in due combination, in just proportion of both sorts of "affections," tendency to promote genuine good being taken as the criterion of the right degrees and proportions. This being established, the main aim of Shaftesbury's argument is to prove that the same balance of private and social affections, which tends naturally to public good, is also conducive to the happiness of the individual in whom it exists. Taking the different impulses in detail, he first shows how the individual's happiness is promoted by developing his social affections, mental pleasures being superior to bodily, and the pleasures of benevolence the richest of all. In discussing this he distinguishes, with well-applied subtlety, between the beneficence of the benevolent emotion in himself, the sympathetic enjoyment of the happiness of others, and the pleasure arising from a consciousness of their love and esteem. He then exhibits the unhappiness that results from any excess of the self-regarding impulses, bodily appetite, desire of wealth, emulation, resentment, even love of life itself; and ends by dwelling on the intrinsic painfulness of all malevolence.

One more special impulse remains to be noticed. We have seen that goodness of character consists in a certain harmony of self-regarding and social affections. But virtue, in Shaftesbury's view, is something more; it implies a recognition of moral goodness and immediate preference of it for its own sake. This immediate pleasure that we take in goodness (and displeasure in its opposite) is due to a susceptibility which he calls the "reflex" or "moral" sense, and compares with our susceptibility to beauty and deformity in external things; it furnishes both an additional direct impulse to good conduct, and an additional gratification to be taken into account in the reckoning which proves the coincidence of virtue and happiness. This doctrine of the moral sense is sometimes represented as Shaftesbury's cardinal principle, but it is not so important, it is not really necessary to his main argument; it is the crown rather than the keystone of his ethical structure.

The appearance of Shaftesbury's Characteristics (1713) marks a turning-point in the history of English ethical thought. With the generation of moralists that followed, the consideration of abstract rational principles falls into the background, and its place is taken by introspective study of the human mind, observation of the actual play of its various impulses and sentiments. This empirical psychology had not indeed been neglected by previous writers. More, among others, had imitated Descartes in a discussion of the passions, and Locke's essay had given a still stronger impulse in the same direction; still, Shaftesbury is the first moralist who distinctly takes psychological experience as the basis of ethics. His suggestions were developed by Hutcheson into one of the most elaborate systems of moral philosophy which we possess; through Hutcheson, if not directly, they influenced Hume's speculations, and are thus connected with later utilitarianism. Moreover, the substance of Shaftesbury's main argument was adopted by Butler, though it could not pass without modifications, and with cautious intelect without receiving important modifications and additions. On the other hand, the ethical optimism of Shaftesbury, rather broadly impressive than exactly reasoned, and connected as it was with a natural theology that implied the Christian scheme to be superfluous, challenged attack equally from orthodox divines and from cynical freethinkers. Of these latter Mandeville, the author of The Fable of the Bees, or Private Vices Public Benefits (1723), was a conspicuous if not a typical specimen. He can hardly be called a "moralist"; and though it is impossible to deny him a considerable share of philosophic penetration, his anti-moral paradoxes have not even apparent coherence. He is convinced that virtue (where it is more than a mere pretence) is purely artificial; but not quite certain whether it is a useless trammel of appetites and passions that are disadvantageous to society, or a device creditable to the politicians who introduced it by playing upon the "pride and vanity" of the "silly creature man." The view, however, to which he gave audacious expression, that moral regulation is an obstacle to the natural man and impedes all that can come without, seems to have been very current in the polite society of his time, as we learn both from Berkeley's Alciphron and from Butler's more famous sermons.

The view of "human nature" against which Butler preached was not exactly Mandeville's, nor was it properly to be called

---

1 It should be observed that, while Clarke is sincerely anxious to prove that most principles are binding independently of Divine appointment, he is no less concerned to show that morality requires the practical support of revealed religion.

2 Three classes of impulses are thus distinguished by Shaftesbury: (1) "Natural Affections," (2) "Self-affections," and (3) "Unnatural Affections." Their characteristics are further considered in the History of Ethics, p. 186 seq.
Hobbist, although Butler fairly treats it as having a philosophical basis in Hobbes’s psychology. It was, so to say, his natural state of man is non-moral, unregulated; moral rules are means to the end of peace, which is a means to the end of self-preservation.” On this view morality, though dependent for their actuality on the social compact which establishes government, is actually binding on man as a reasonable being. But the quasi-theistic assumption that what is natural must be reasonable remained in the minds of Hobbes’s most docile readers, and in combination with his thesis that egoism is natural, tended to produce results which were dangerous to social well-being. To meet this view Butler does not content himself, as is sometimes carelessly supposed, with insisting on the natural claim to authority of the conscience which his opponent repudiated as artificial; he adds a subtle and effective argument ad hominem. He first follows Shaftesbury in exhibiting the social affections as no less natural than the appetites and desires which tend directly to self-preservation; then reviving the Stoic view of the prime nature, the first objects of natural appetites, he argues that pleasure is not the primary aim of the impulses which Shaftesbury allowed to be “self-affections”; but rather a result which follows upon their attaining their natural ends. We have, in fact, to distinguish self-love, the “general desire that every man hath of his own happiness” or pleasure, from the particular affections, passions, and appetites directed towards objects other than pleasure, in the satisfaction of which pleasure consists. The latter are “necessarily presupposed” as distinct impulses in “the very idea of an interested pursuit”; since, if there were no such pre-existing desires, there would be no pleasure for self-love to aim at. Thus the object of hunger is not the pleasure of eating but food; hunger is therefore, strictly speaking, no more “interested” than benevolence; granting that the pleasures of the table are an important element in the happiness at which self-love aims, the same at least may be said for the pleasures of love and sympathy. Further, so far from bodily appetites (or other particular desires) being forms of self-love, there is no one of them which under certain circumstances may not come into conflict with it. Indeed, it is common for men to sacrifice to passion what they know to be their true interests; at the same time we do not consider such conduct “natural” in man as a rational being; we rather regard it as natural for him to govern his transient impulses. Thus the notion of natural unregulated egoism turns out to be a psychological chimera. Indeed, we may say that an egoist must be doubly self-regulative, since rational self-love ought to restrain not only other impulses, but itself also; for as happiness is made up of feelings that result from the satisfaction of impulses other than self-love, any over-develop-ment of the latter, enfeebling these other impulses, must proportionally diminish the happiness at which self-love aims. If, then, it be admitted that human impulses are naturally under government, the natural claim of conscience or the moral faculty to be the supreme governor will have to be defended. Also, by Butler’s own account, a similar authority, which may come into conflict with that of conscience? Butler fully admits this, and, in fact, grounds on it an important criticism of Shaftesbury. We have seen that in the latter’s system the “moral sense” is not absolutely required, or at least is necessary only as a substitute for enlightened self-regard; since if the harmony between prudence and virtue, self-regarding and social impulses, is complete, mere self-interest will prompt a duly enlightened mind to maintain precisely that “balance” of affections in which goodness consists. But to Butler’s more cautious mind the completeness of this harmony did not seem sufficiently demonstrable to be taken as a basis of moral teaching; he has at least to contemplate the possibility of a man being convinced of the opposite; and he argues that unless we regard conscience as essentially authoritative—which is not implied in the term “moral sense”—such a man is really bound to be vicious; “since interest, one’s own happiness, is a manifest obligation.”

Still on this view, even if the authority of conscience be asserted, we seem reduced to an ultimate dualism of our rational nature. Butler’s ordered polity of impulses turns out to be a polity with two independent governments. Butler does not deny this, so far as mere claim to authority is concerned; but he maintains that, the dictates of conscience being clear and certain, while the calculations of self-interest lead to merely probable conclusions, it can never be practically reasonable to disobey the former, even apart from any proof which religion may furnish of the absolute coincidence of the two in a future life.

This dualism of governing principles, conscience and self-love, in Butler’s system, and perhaps, too, his revival of the Platonic conception of human nature as an ordered and governed community of impulses, is perhaps most nearly anticipated in Wollaston’s Religion of Nature Delineated (1722). Here, for the first time, we find “moral good” and “natural good” or “happiness” treated separately as two essentially distinct objects of rational pursuit and investigation; the harmony between them was regarded as matter of religious faith, not moral knowledge. Wollaston’s theory of moral evil as consisting in the practical contradiction of a true proposition, closely resembles the most paradoxical part of Clarke’s doctrine, and was not likely to approve itself to the strong Common sense of Butler; but his statement of happiness or pleasure as a “justly desirable” end at which every rational being “ought” to aim corresponds exactly to Butler’s conception of self-love as a naturally governing impulse; while the “moral arithmetic” with which he compares pleasures and pains, and endeavours to make the notion of happiness quantitatively precise, is an anticipation of Benthamism.

There is another side of Shaftesbury’s harmony which Butler was ultimately led to oppose in a more decided manner,—the opposition, namely, between conscience or the moral sense and the social affections. In the Sermons, indeed (1729), Butler seems to treat conscience and calm benevolence as permanently allied though distinct principles, but in the Dissertation on Virtue, appended to the Analogy (1730), he maintains that the conduct dictated by conscience will often differ widely from that to which mere regard for the production of happiness would prompt. We may take this latter treatise as representing the first in the development of English ethics, at whose doors the afterwards called “utilitarian” and “intuitionist” morality first formally opposed; in earlier systems the antithesis is quite latent, as we have incidentally noticed in the case of Cumberland and Clarke. The argument in Butler’s dissertation was probably directed chiefly against Hutcheson, who in his Inquiry into the Original of our Ideas of Beauty and Virtue had definitely identified virtue with benevolence. The identification is slightly qualified in Hutcheson’s posthumously published System of Moral Philosophy (1755), in which the general view of Shaftesbury is more fully developed, with several new psychological distinctions, including Butler’s separation of “calm” benevolence—as well as, after Butler, “calm self-love”—from the “turbulent” passions, selfish or social. Hutcheson follows Butler again in laying stress on the regulating and controlling function of the moral sense; but he still regards “kind affections” as the principal objects of moral approbation—the “calm” rather than “passive” affections being preferred to the turbulent and narrow—together with the desire and love of moral excellence which is ranked with universal benevolence, the two being equally worthy and necessarily harmonious. Only in a secondary sense is approval due to certain “abilities and dispositions immediately connected with virtuous affections,” as candour, veracity, fortitude, sense of honour; while in a lower grade still are placed sciences and arts, along with even bodily skills and gifts; indeed, the approbation we give to these is not strictly moral, but is referred to the “sense of decency or dignity,” which (as well as the sense of honour) is to be distinguished from

1 In a remarkable passage near the close of his eleventh sermon Butler seems even to allow that conscience would have to give way to self-love, if it were possible (which it is not) that the two should come into ultimate and irreconcilable conflict.
the moral sense. Calm self-love Hutcheson regards as morally indifferent; though he enters into a careful analysis of the elements of happiness, in order to show that a true regard for private interest always coincides with the moral sense and with benevolence. While thus maintaining Shaftesbury’s “harmony” between public and private good, Hutcheson is still more careful to establish the strict disinterestedness of benevolent affections. Shaftesbury had conclusively shown that these were not in the vulgar sense selfish; but the very stress which he lays on the pleasure inseparable from their exercise suggests a subtle egoistic theory which he does not expressly exclude, since it may be said that this “intrinsic reward” constitutes the real motive of the benevolent man. To this Hutcheson replies that no doubt the exquisite delight of the emotion of love is a motive to sustain and develop it; but this pleasure cannot be directly obtained, any more than other pleasures, by merely desiring it; it can be sought only by the indirect method of cultivating and indulging the disinterested desire for others’ good, which is thus obviously distinct from the desire for the pleasure of benevolence. He points to the fact that the imminence of death often intensifies instead of diminishing a man’s desire for the welfare of those he loves, as a proof of the power of the disinterested but self-love; adding, as a corroborative evidence, that the sympathy and admiration commonly felt for self-sacrifice depends on the belief that it is something different from refined self-seeking.

It remains to consider how, from the doctrine that affection is the proper object of approbation, we are to deduce moral rules or “natural laws” prescribing or prohibiting outward acts. It is obvious that all actions conducing to the general good will deserve our highest approbation if done from disinterested benevolence; but how if they are not so done? In answering this question, Hutcheson avails himself of the scholastic distinction between “material” and “formal” goodness. “An action,” he says, “is materially good when in fact it tends to the interest of the system, so far as we can judge of its tendency, or to the good of some part consistent with that of the system, whatever were the affections of the agent. An action is formally good when it flowed from good affection in a just proportion.” On the pivot of this distinction Hutcheson turns round from the point of view of Shaftesbury to that of later utilitarianism. As regards “material” goodness of action, he adopts explicitly and unreservedly the formula afterwards taken up by Bentham, by establishing that “that action is best which procures the greatest happiness for the greatest numbers, and the worst which in a like manner occasions misery.” Accordingly his treatment of external rights and duties, though decided inferior in methodical clearness and precision, does not differ in principle from that of Paley or Bentham, except that he lays greater stress on the immediate conduciveness of actions to the happiness of individuals, and more often refers in a merely supplementary or restrictive way to their tendencies in respect of general happiness. It may be noticed, too, that he still accepts the “social compact” as the natural mode of constituting government, and regards the obligations of subjects to civil obedience as normally dependent on a tacit contract; though he is careful to state that consent is not absolutely necessary to the just establishment of beneficent government, nor the source of irrevocable obligation to a pernicious one.

An important step further in political utilitarianism was taken by Hume in his Treatise on Human Nature (1739). Hume considered the object of society to be the establishment of a government, fully instituting a new government, and may therefore be properly regarded as the ground of allegiance to it at the outset; but he urges that, when once it is firmly established the duty of obeying it rests on precisely the same combination of private and general interests as the duty of keeping promises; it is therefore absurd to base the former on the latter. Justice, veracity, fidelity to compacts and to governments, are co-

orderate; they are all “artificial” virtues, due to civilization, and not belonging to man in his “ruder and more natural” condition; our approbation of all alike is founded on our perception of their useful consequences. It is this last position that constitutes the fundamental difference between Hutcheson’s ethical doctrine and Hume’s. The former, while accepting utility as the criterion of “material goodness,” had adhered to Shaftesbury’s view that dispositions, not results of action, were the proper object of moral approval; at the same time, while giving to benevolence the first place in his account of personal merit, he had shrunk from the paradox of treating it as the sole virtue, and had added a rather undefined and unexplained train of qualities,—veracity, fortitude, activity, industry, sagacity,—immediately approved in various degrees by the “moral sense” or the “sense of dignity.” This naturally suggested to a mind like Hume’s, anxious to apply the experimental method to psychology, the problem of reducing these different elements of personal merit—rather our approval of them—to some common principle. The old theory that referred this approval entirely to self-love, is, he holds, easy to disprove by “cruel experiments” on the play of our moral sentiments; rejecting this, he analyses a required explanation in the sympathetic pleasure that attends our perception of benevolence,—virtue to the interests of human beings other than ourselves. It is his efforts to establish this inductively by a survey of the qualities, commonly praised as virtues, which he finds to be always either useful or immediately agreeable, either (1) to the virtuous agent himself or (2) to others. In class (2) he includes, besides the Benevolence of Shaftesbury and Hutcheson, the useful virtues, Justice, Veracity and Fidelity to compacts; as well as such immediately agreeable qualities as politeness, wit, modesty and even cleanliness. The most original part of his discussion, however, is concerned with qualities immediately useful to their possessor. The most cynical man of the world, he says, with whatever “sullen incredulity” he may repudiate virtue as a hollow pretence, cannot really refuse his approbation to “discretion, caution, enterprise, industry, frugality, economy, good sense, prudence, discernment”; nor again, to “temperance, sobriety, patience, perseverance, considerateness, secrecy, order, insinuation, address, presence of mind, quickness of conception, facility of expression.” It is evident that the merit which Hume considers at the outset is chiefly due to our perception of their tendency to serve the person possessing it; so that the cynic in praising them is really exhibiting the self-sympathy of which he doubts the existence. Hume admits the difficulty that arises, especially in the case of the “artificial” virtues, such as justice, &c., from the undeniable fact that we praise them and blame their opposites without consciously reflecting on useful or pernicious consequences; but considers that this may be explained as an effect of “education and acquired habits.”

So far the moral faculty has been considered as contemplative rather than active; and this, indeed, is the point of view from which Hume mainly regards it. If we ask what actual motive we have for virtuous conduct, Hume’s answer is not quite clear. On the one hand, he speaks of moral approbation as derived from “humanity and benevolence,” while expressly recognizing, after Butler, that there is a strictly disinterested element in our benevolent impulses (as also in hunger, thirst, love of fame and other passions). On the other hand, he does not seem to think that moral approval or “vile” can become a motive to action,” except as it “gives pleasure or pain, and thereby constitutes happiness or misery.” It is difficult to reconcile these views quite consistent; but at any rate Hume emphatically maintains that “reason is no motive to action,” except so far as it “directs the impulse received from appetite or inclination.”

Hume’s ethical view was finally stated in his Inquiry into the Principles of Morals (1751), which is at once more popular and more purely utilitarian than his earlier work.

Hume remarks that in some cases, by “association of ideas,” the rule by which we praise and blame is extended beyond the principle of utility from which it arises; but he allows much less scope to this explanation in his second treatise than in his first.
and recognizes—in his later treatise at least—no “obligation” to virtue, except that of the agent’s interest or happiness. He attempts, however, to show, in a summary way, that all the duties which his moral theory recommends are also “the true interest of the individual,” “taking into account the importance to his happiness of ‘peaceful reflection on one’s own conduct.’” But even if we consider the moral consciousness merely as a particular kind of pleasurable emotion, there is an obvious question suggested by Hume’s theory, to which he gives no adequate answer. If the essence of “moral taste” is sympathy with the pleasures of others, why is not this specific feeling excited by other things beside virtue that tend to cause such pleasure? On this point Hume contents himself with the vague remark that “there are a numerous set of passions and sentiments, of which thinking rational beings are by the original constitution of nature the only proper objects.” The truth is, that Hume’s notion of moral approbation was very loose, as is sufficiently shown by the list of “useful and agreeable” qualities which he considers worthy of approbation. It is therefore hardly surprising that his theory should leave the specific quality of the moral sentiments a fact still needing to be explained. An original and ingenious solution of this problem was offered by his contemporary Adam Smith, in his *Theory of Moral Sentiments* (1759).

Without denying the actuality or importance of sympathetic pleasure in the perceived or inferred effects of virtues and vices he yet holds that the essential part of common moral sentiment is constituted rather by a more direct sympathy with the impulses that prompt to action or expression. The spontaneous play of this sympathy he treats as an original and inexplicable fact of human nature, but he considers that its action is powerfully sustained by the pleasure that each man finds in the accord of his feelings with another’s. By means of this primary element, compounded in various ways, Adam Smith explains all the phenomena of the moral consciousness. He takes first the semi-moral notion of “propriety” or “decorum,” and endeavours to show inductively that our application of this notion to the social behaviour of another is determined by our degree of sympathy with the feeling expressed in such behaviour. Thus the prescriptions of good taste in the expression of feeling may be summed up in the principle, “reduce or raise the expression to that with which spectators will sympathize.” When the effort to restrain feeling is exhibited in a degree which surprises as well as pleases, it excites admiration as a virtue or excellence; such excellences Adam Smith quaintly calls the “awful and respectable,” contrasting them with the “amiable virtues,” which constitute the most fitting effort to sympathize, when exhibited in a remarkable degree. From the sentiment of propriety and admiration we proceed to the sense of merit and demerit. Here a more complex phenomenon presents itself for analysis; we have to distinguish in the sense of merit—(1) a direct sympathy with the sentiments of the agent, and (2) an indirect sympathy with the gratification of those who receive the benefit of his actions. In the case of demerit there is a direct antipathy to the feelings of the misdoer, but the chief sentiment excited is sympathy with those injured by the misdeed. The object of this sympathetic resentment, compelling us to punish, is what we call injustice; and thus the remarkable stringency of the obligation to act justly is explained since the recognition of any action as unjust involves the admission that it may be forcibly obstructed or punished. Moral judgments, then, are expressions of the complex normal sympathy of an impartial spectator with the active impulses that prompt to and result from actions. In the case of our own conduct what we call conscience is really sympathy with the feelings of an imaginary impartial spectator.

Adam Smith gives authority to his moral system by saying that “moral principles are justly to be regarded as the laws of the Deity”; but this he never proves. So Hume insists emphatically on the “reality of moral obligation”; but it is found to mean no more by this than the real existence of the likes and dislikes that human beings feel for each other’s qualities. The fact is that amid the analysis of feelings aroused by the sentimentalism of Shaftesbury’s school, the fundamental questions “What is right?” and “Why?” had been allowed to drop into the background, and the consequent danger to morality was manifest. The binding force of moral rules becomes evanescent if we admit, with Hutcheson, that the “sense” of them may properly vary from man to man as the palate does; and it seems only another way of putting Hume’s doctrine, that reason is not concerned with the ends of action, to say that the mere existence of a moral sentiment is in itself no reason for obeying it. A reaction, in one form or another, against the tendency to dissolve ethics into psychology was inevitable; since mankind generally could not be so far absorbed by the interest of psychological hypothesis as to forget their need of establishing practical principles. It was obvious, too, that this reaction might take place in either of the two lines of thought, which, having been peacefully allied, might diverge: and indeed, while the one line was led by Butler and Hutcheson, it might either fall back on the moral principles commonly accepted, and, affirming their objective validity, endeavour to exhibit them as a coherent and complete set of ultimate ethical truths; or it might take the utility or conduc- tiveness to pleasure, to which Hume had referred for the origin of most sentiments, as an ultimate end and standard by which these sentiments might be judged and corrected. The former is the line adopted with substantial agreement by Price, Reid, Stewart and other members of the still existing Intuitional school; the latter method, with considerably more divergence of view and treatment, was employed independently and almost simultaneously by Paley and Bentham in both ethics and politics, and is at the present time widely maintained under the name of Utilitarianism.

Price’s *Review of the Chief Questions and Difficulties of Morals* was published in 1757, two years before Adam Smith’s treatise. In regarding moral ideas as derived from the “intuition of truth or immediate discernment of the nature of things” by the common sense, Price holds the general view of Cartwright and Clarke; but with several specific differences. Firstly, his conception of “right” and “wrong” as “single ideas, incapable of definition or analysis—the notions “right,” “fit,” “ought,” “duty,” “obligation,” being coincident or identical—at least avoids the confusions into which Clarke and Wollaston had been led by pressing the analogy between ethical and physical truth. Secondly, the emotional element of the moral consciousness, on which attention had been concentrated by Shaftesbury and his followers, though distinctly recognized as accompanying the intellectual intuition, is carefully subordinated to it. While right and wrong, in Price’s view, are “real objective qualities” of actions, moral “beauty and deformity” are subjective ideas; representing feelings which are partly the necessary effects of the perceptions of right and wrong in rational beings as such, partly due to an “implanted sense” or varying emotional susceptibility. Thus, both reason and sense of instinct co-operate in the impulse to virtuous conduct, though the rational element is primary and paramount. Price further follows Butler in distinguishing the perception of merit and demerit in accordance with the perception of right and wrong in actions; the former being, however, only a peculiar species of the latter, since, to perceive merit in any one is to perceive that it is right to reward him. It is to be observed that both Price and Reid are careful to state that the merit of the agent depends entirely on the intention or “formal rightness” of his act; a man is not blameworthy for unintended evil, though he may of course be blamed for any wilful neglect (cf. Aris., *Eth. Nic.*, iii. 1), which has caused him to be ignorant of his real duty. When we turn to the subject matter of virtue, we find that Price, in comparison with More or Clarke is decidedly
ETHICS

laxer in accepting and stating his ethical first principles; chiefly owing to the new antithesis to the view of Shaftesbury and Humeon by which his controversial position is complicated. What Price is specially concerned to show is the existence of ultimate principles beside the principle of universal benevolence. Not that he repudiates the obligation either of rational benevolence or self-love; on the contrary, he takes more pains than Butler to demonstrate the reasonableness of either principle. "There is not anything," he says, "of which we have more undeniably an intuitive notion, than that it is 'right to pursue and promote happiness,' whether for ourselves or for others." Finally, Price, writing after the demonstration by Shaftesbury and Butler of the actuality of disinterested impulses in human nature, is bolder and clearer than Cudworth or Clarke in insisting that right actions are to be chosen because they are right by virtuous agents as such, even going so far as to lay down that an act loses its moral worth in proportion as it is done from natural inclination.

On this latter point Reid, in his Essays on the Active Powers of the Human Mind (1788), states a conclusion more in harmony with common sense, only maintaining that "no act is morally good merely as such, regarded as right, has not some influence.

1 This is partly due to the fact that Shaftesbury builds more distinctly because Price on the foundation laid by Butler; especially in his acceptance of that duality of governing principles which we have noticed as a cardinal point in the latter's doctrine. Reid considers "regard for one's own good on the whole" (Butler's self-love) and "sense of duty" (Butler's conscience) as two essentially distinct and co-ordinate rational principles, though naturally often comprehended under the one term, Reason. The rationality of the former principle he takes pains to explain and establish; in opposition to Hume's doctrine that it is no part of the function of reason to determine the ends which we ought to pursue, or the preference due to one end over another. He urges that the notion of "good on the whole" is one which only a reasoning being can form, involving as it does abstraction from the objects of all particular desires, and comparison of past and future with present feelings; and maintains that it is a contradiction to suppose a rational being to have the notion of its Good on the Whole without a desire for it, and that such desire perfectly regulates its passionate appetites and passions. It cannot readily be subordinate to the moral faculty; in fact, a man who doubts the coincidence of the two—which on religious grounds we must believe to be complete in a morally governed world—is reduced to the "miserable dilemma whether it is better to be a fool or a knave."

As regards the moral faculty itself, Reid's statement coincides in the main with Price's; it is both intellectual and active, not merely perceiving the "right" or "moral obligation" of actions (which Reid conceives as a simple unanalysable relation between act and agent), but also compelling the will to the performance of what is seen to be right. Both thinkers hold that this perception of right and wrong in actions is accompanied by a perception of merit and demerit in agents, and also by a specific emotion; but whereas Price conceives this emotion chiefly as pleasure or pain, analogous to that produced in the mind by physical beauty or deformity, Reid regards it chiefly as benevolent affection, esteem and sympathy (or their opposites), for the virtuous (or vicious) agent. This "pleasurable good-will," when the moral judgment relates to a man's own act, becomes "the testimony of a good conscience—the purest and most valuable of all human enjoyments." Reid is careful to observe that this moral faculty is not "innate" except in germ; it stands in need of "education, training, exercise (for which society is indispensable), and habit," in order to the attainment of moral truth. He does not with Price object to it being called the "moral sense," provided we understand by

"the a source not merely of feelings or notions, but of "ultimate truths." Here he omits to notice the important question whether the premises of moral reasoning are universal or individual judgments; as to which the use of the term "sense" seems rather to suggest the second alternative. Indeed, he seems himself quite undecided on this question; since, though he generally represents ethical method as deductive, he also speaks of the "original judgment that this action is right and that wrong."

The truth is that the construction of a scientific method of ethics is a matter of little practical moment to Reid. Thus, though he offers a list of first principles, by deduction from which these common opinions may be confirmed, he does not present it with any claim to completeness. Besides maxims relating to virtue in general,—such as (1) that there is a right and wrong in conduct, but (2) only in voluntary conduct, and that we ought (3) to take pains to learn our duty, and (4) fortify ourselves against temptations to deviate from it—Reid states five fundamental axioms. The first of these is merely the principle of rational self-love, "that we ought to prefer a greater to a lesser good, though more distinct, and a less evil to a greater,"—the mention of which seems rather inconsistent with Reid's distinct separation of the terms "self-love" and "self-right."
The third is merely the general rule of benevolence stated in the somewhat vague Stoical formula, that "so one is born for himself only."
The fourth, again, is the merely formal principle that "right and wrong must be the same to all in all circumstances," which belongs equally to all systems of objective morality; while the fifth prescribes the religious duty of "veneration or submission to God." Thus, the only principle which ever appears to offer definite guidance as to social duty is the second, "that so far as the intention of nature appears in the constitution of man, we ought to act according to that intention," the vague 8 of which is obvious. (For Reid's views on moral freedom see A. Bain, Mental Science, pp. 422, seq.)

A similar incompleteness in the statement of moral principles is found if we turn to Reid's disciple, Dugald Stewart, whose Philosophy of the Active and Moral Powers of Man (1828) contains the general view of Butler and Reid, and to some extent that of Price,—expounded with much greater clarity and precision, but without important original additions or modifications. Stewart lays stress on the obligation of justice as distinct from benevolence; his notion of justice represents it as essentially impartiality, a virtue which (as was just now said of Reid's fourth principle) must equally find a place in the utilitarian or any other system that lays down universally applicable rules of morality. Afterwards, however, Stewart distinguishes "intelligence or honesty" a branch of justice concerned with the rights of other men, which form the subject of "natural jurisprudence." In this department he lays down the moral axiom "that the labourer is entitled to the fruit of his own labour" as the principle on which complete rights of property are founded; maintaining that occupancy alone would often confer a transient right of possession during use. The only other principles which he discusses are veracity and fidelity to promises, gratitude being treated as a natural instinct prompting to a particular kind of just actions.

It will be seen that neither Reid nor Stewart offers more than a very meagre and tentative contribution to that ethical science by which, as they maintain, the received rules of morality may be rationally deduced from self-evident first principles. A more ambitious attempt to take a similar direction was made by Whewell in his Elements of Morality (1846). Whewell's general moral view differs from that of his Scottish predecessors chiefly in a point where we may trace the influence of Kant—viz. in his rejection of self-love as an independent rational and governing principle, and his consequent refusal to admit happiness, apart from duty, as a reasonable end for

2 E.g. Reid proposes to apply this principle in favour of monogamy, arguing from the proportion of males and females born; without explaining why, if the intention of nature hence inferred excludes occasional polygamy, it does not also exclude occasional celibacy.
In Paley's Principles of Moral and Political Philosophy (1785), the link between general pleasure (the standard) and particular moral motives (the motive) is supplied by the consideration of divine legislation. The God of this age is to be “urged by a violent motive resulting from the command of another”; in the case of moral obligation, the command proceeds from God, and the motive lies in the expectation of being rewarded and punished after this life. The commands of God are to be ascertained “from scripture and the light of nature combined.” Paley, however, holds that scripture is given less to teach morality than to illustrate it by example and enforce it by new sanctions and greater certainty, and that the light of nature makes it clear that God wills the happiness of his creatures. Hence, his method in deciding moral questions is chiefly that of estimating the tendency of actions to promote or diminish the general happiness. To meet the obvious objections to this method, based on the immediate happiness caused by admitted crimes (such as “knocking a rich villain on the head”), he lays stress on the necessity of general rules in any kind of legislation; while, by urging the importance of forming and maintaining good habits, he evades the difficulty of calculating the consequences of particular actions. In this way the utilitarian method is found to be subversive tendencies which Butler and others had discerned in this field. Paley, it merely explains the current moral and jural distinctions, exhibits the obvious basis of expediency which supports most of the received rules of law and morality and furnishes a simple solution, in harmony with common sense, of some perplexing casuistical questions. Thus (e.g.) “natural rights” become rights of which the general observance would be useful apart from the institution of civil government; as distinguished from the no less binding “adventitious rights,” the utility of which depends upon this institution. Private property is in this sense “natural” from its obvious advantages in encouraging

The originality—such as is—of Paley's system (as of Bentham's) lies in its method of working out details rather than in its principles of construction. Paley expressly acknowledges his obligations to the original and suggestive, though diffuse and whimsical, work of Abraham Tucker (Light of National Pursued, 1768-1774). In this treatise, as in Paley's, we find "every man's own satisfaction, the spring that actuates all his motives," connected with "general good, the root whereat all our rules of conduct and sentiments of honour are to branch," by means of natural theology demonstrating the "evangelic goodness of the author of nature," or "God." Tucker is also careful to distinguish the "deciding measure" of "one and the same in kind, however much it may vary in degree, whether a man is pleased with hearing music, seeing prospects, tasting dainties, performing laudable actions, or making ingenuous professions," and again that "all this is no more than 'quantity of happiness,' to which 'every pleasure that we do to our neighbour is an addition.'" There is, however, in Tucker's theological link between private and general happiness a peculiarity in general reasoning on the subject, viz., "by what means men having no free will have really no desert; therefore the divine equity must ultimately distribute happiness in equal shares to all; therefore I must ultimately increase my own happiness most by concern that adds most to the general fund which Providence administers.

But in fact the outline of Paley's utilitarianism is to be found a generation earlier—in Gay's dissertation prefixed to Law's edition of King's Essays on Ethics, in 1691. "The idea of virtue is the conformity to a rule of life, directing the actions of all rational creatures with respect to each other's happiness; to which every one is always obliged. ... Obligation is the necessity of doing or omitting something in order to be happy. ... Full and complete obligation, we shall be able to judge, is arising from the authority of God. ... The will of God [so far as it directs behaviour to others] is the immediate rule or criterion of virtue ... but it is evident from the nature of God that he could not, in any scheme of designing in creating mankind, deprive them of happiness; and therefore he wills their happiness; therefore that my behaviour so far as it may be a means to the happiness of mankind should be such; so this happiness of mankind may be said to be the criterion of virtue, and the reverse of the reverse." In this dissertation, as in no other existing version, the term "virtue" is used to indicate the rule by which actions are directed or inhibited. It may be said that virtue, in the old sense, is the criterion of morality, as happiness is the criterion of virtue.
labour, skill, preservative care; though actual rights of property depend on the general utility of conforming to the law of the land by which they are determined. We observe, however, that Paley's method is often mixed with reasonings that belong to an alien and older manner of thought; as when he supports the claim of the poor to charity by referring to the intention of mankind "when they agreed to a separation of the common fund," or when he infers that monogamy is a part of the divine design from the equal numbers of males and females born. In other cases his statement of utilitarian considerations is fragmentary and unmethodical, and tends to degenerate into loose exhortation on rather trite topics.

In unity, consistency and thoroughness of method, Bentham's utilitarianism has a decided superiority over Paley's. He considers actions solely in respect of their pleasurable and painful consequences, expected or actual; and he recognizes the need of making a systematic register of these consequences, free from the influences of common moral opinion, as expressed in the "eulogistic" and "dyslogistic" terms in ordinary use. Further, the effects that he estimates are all of a definite, palpable, empirically accessible kind; and he does not allow that most men feel and all can observe, so that all his political or moral inferences lie open at every point to the test of practical experience. Every one, it would seem, can tell what value he sets on the pleasures of alimentation, sex, the senses generally, wealth, power, curiosity, sympathy, antipathy (malevolence), the goodwill of individuals or of society at large, and on the corresponding pains, as well as the pains of labour and organic disorders; and can guess the rate at which they are valued by others; therefore if it be once granted that all actions are determined by pleasures and pains, and are to be tried by the same standard, the art of legislation and private conduct is apparently placed on an empirical basis. Bentham, no doubt, seems to go beyond the limits of experience proper in recognizing "religious" pains and pleasures in his fourfold division of sanctions, side by side with the "physical," "political," and "moral" or "social"; but the truth is that he does not seriously take account of them, except in so far as religious hopes and fears are motives actually operating, which therefore admit of being observed and measured as much as any other motives. He does not himself use the will of an omnipotent and benevolent being as a means of logically connecting individual and general happiness. He thus undoubtedly simplifies his system, and avoids the doubtful inferences from nature and Scripture in which Paley's position is involved; but this gain is dearly purchased. For in answer to the question that immediately arises, How then are the sanctions of the moral rules which it will most conduce to the general happiness for men to observe, shown to be always adequate in the case of all the individuals whose observance is required? he is obliged to admit that "the only interests which a man is at all times sure to find adequate motives for consulting are his own." Indeed, in many parts of his work, in the department of legislative and constitutional theory, it is rather assumed that the interests of some men will continually conflict with those of their fellows, unless we alter the balance of prudential calculation by a readjustment of penalties. But on this assumption a system of private conduct on utilitarian principles cannot be constructed until legislative and constitutional reform has been perfected. And, in fact, "private ethics," as conceived by Bentham, does not exactly expound such a system; but rather exhibits the coincidence, so far as it extends, between private and general happiness, in that part of each man's conduct that lies beyond the range of useful legislation. It was not his place, as a practical philanthropist, to dwell on the defects in this coincidence;" and since what men generally expect from a moralist is a completely reasoned account of what they ought to do, it is not surprising that some of Bentham's disciples should have either ignored or endeavoured to supply the gap in his system. One section of the school even maintained that to be a sincere supporter of utilitarianism that a man always gains his own greatest happiness by promoting that of others; another section, represented by John Austin, apparently returned to Paley's position, and treated utilitarian morality as a code of divine legislation; others, with Grote, are content to abate the severity of the claims made by "general happiness" on the individual, and to consider utilitarian duty as practically limited by reciprocity; while on the opposite side an unqualified subordination of private to general happiness was advocated by J. S. Mill, who did more than any other member of the school to spread and popularize utilitarian ethics in and politics.

The fact is that there are several different ways in which a utilitarian system of morality may be used, without deciding whether the sanctions attached to it are always adequate. (1) It may be presented as practical guidance to all who choose "general good" as their ultimate end, whether they do so on religious grounds, or are actuated by a sense of justice (as in impartial sympathy, or because their conscience reacts to any conduct contrary to utilitarian principles, or for any combination of these or any separate reason); or (2) it may be offered as a code to be obeyed not absolutely, but only so far as the coincidence of private and general interest may in any case be judged to extend; or again (3) it may be proposed as a standard by which men may reasonably agree to praise and blame the conduct of others, even though they may not always think fit to act on it. We may regard morality as a kind of supplementary legislation, supported by public opinion, which we may expect the public, when duly enlightened, to frame in accordance with the public interest. Still, even from this point of view, which is that of the legislator or social reformer rather than the moral philosopher, our code of duty must be greatly influenced by our estimate of the degree in which men are normally influenced by self-regard (in its ordinary sense of regard for interests not sympathetic) and by sympathy or benevolence, and of the range within which sympathy may be expected to be generally effective. Thus, for example, the moral standard for what is utilitarian in the sense of self-regard to gain the support of public opinion must be essentially modified according to the social condition of the people in question, according as he holds with Bentham that nothing but self-regard will "serve for diet," though "for a dessert benevolence is a very valuable addition"; or with J. S. Mill that disinterested public spirit should be the prominent motive in the performance of all socially useful work, and that even hygienic precepts should be inculcated, not chiefly on grounds of prudence, but because "by squandering our health we disable ourselves from rendering services to our fellow-creatures."

Not less important is the interval that separates Bentham's polemical attitude towards the moral sense from Mill's conciliatory position, that "the mind is not in a state conformable to utility unless it loves virtue as a thing desirable in itself." Such love of virtue Mill holds to be in a sense natural, though not an ultimate and inexplicable fact of human nature; it is to be explained by the "Law of Association" of feelings and ideas, through which objects originally desired as a means to another end become to be directly pleasant or desirable. Thus the miser first sought money as a means to comfort, but ends by sacrificing comfort to money, and similarly others, to the first promptings to justice (or any other virtue) spring from the non-moral pleasures gained or pains avoided by it, through the link formed by repeated virtuous acts the performance of which ultimately comes to have that immediate satisfaction attached to it which we distinguished as moral. Indeed, the acquired tendency to virtuous conduct may become so strong that the habit of willing it may continue, "even when the reward which

1 It should be observed that Austin, after Bentham, more frequently uses the term "moral" to connote what he more distinctly calls "positive morality," the code of rules supported by common opinion in any society.
the virtuous man receives from the consciousness of well-doing is anything but an equivalent for the sufferings he endures or the pains he may have to renounce; and he is entitled to the before-mentioned self-sacrifice of the moral hero is conceived by Mill to be possible and actual. The moral sentiments, on this view, are not phases of self-love as Hobbes held; nor can they be directly identified with sympathy, either in Hume's way or in Adam Smith's; in fact, though apparently simple they are really derived in a complex manner from self-love and sympathy combined with more primitive impulses. Justice (e.g.) is regarded by Mill as essentially resentment moralized by enlarged sympathy and intelligent self-interest; what we mean by injustice is harm done to an assignable individual by a breach of some rule for which we desire the violator to be punished, for the sake both of the person injured and of society at large, including ourselves. As regards moral sentiments generally, the view suggested by Mill is more definitely given by the chief living representative of the associationist school, Alexander Bain; by whom the distinctive characteristics of conscience are traced to "education under government or authority," though prudence, self-interested sympathy and other emotions combine to swell the mass of feeling vaguely denoted by the term moral. The combination of antecedents is somewhat differently given by different writers; but all agree in representing the conscience of any individual as naturally correlated to the interests of the community of which he is a member, and thus a natural ally in enforcing utilitarian rules, or even a valuable guide when utilitarian calculations are difficult and uncertain.

The substitution of hypothetical history for direct analysis of the moral sense is really older than the utilitarianism of Paley and Bentham, which it has so profoundly modified. The effects of association in modifying mental phenomena were noticed by Locke, and made a cardinal point in the metaphysics of Hume; who also referred to the principle slightly in his account of justice and other "artificial" virtues. Some years earlier, Gay, 1 admitting Hucheson's proof of the actual disinterestedness of moral and benevolent impulses, had maintained that these (like the desires of knowledge or fame, the delight of reading, hunting and planting, &c.) were derived from self-love by "the power of association." But a thorough and systematic application of the principle to ethical psychology is first found in Hartley's Observations on Man (1748). Hartley, too, was the first to conceive association as producing, instead of mere cohesion of mental phenomena, a quasi-chemical combination of these into a compound apparently different from its elements. He shows elaborately how the pleasures and pains of "imagination, ambition, self-interest, sympathy, theophecy, and the moral sense" are developed out of the elementary pleasures and pains of sensation; by the coalescence into really complex but apparently single ideas of the "miniatures" or faint feelings which the repetition of sensations contemporaneously or in immediate succession tends to produce in cohering groups. His theory assumes the correspondence of mind and body, and is based on the "power (1) of the reproduction of ideas from sensations, and of "compound vibrations," 2 or the "dulcification" of these vibrations, and of "compound vibrations (2)"; and on the "dulcification" of these vibrations, and on the "compound vibrations (2)"; and on the "dulcification" of these vibrations, and on the "compound vibrations (2)".

The general view was afterwards developed with much vigour and clearness on the psychical side alone by James Mill in his Analysis of the Human Mind. The whole theory has been persistently controverted by writers of the intuitional school, who (unlike Hartley) have usually thought that this derivation 1 in the before-mentioned dissertation. Cf. note 2 to p. 835. Hartley refers to this treatise as having supplied the starting-point for his own system. 2 It should be noticed that Hartley's sensationalism is far from leading him to exalt the corporeal pleasures. On the contrary, he tries to prove elaborately that they as well as the pleasures of imagination, ambition, self-interest cannot be made an object of primary pursuit without a loss of happiness on the whole—one of his arguments being that these pleasures occur earlier in time, and "which is prior in the order of nature is always less perfect than that which is posterior." of moral sentiments from more primitive feelings would be detrimental to the authority of the former. The chief argument against this theory has been based on the early period at which these sentiments are manifested by children, which hardly allows time for association to produce the effects ascribed to it. This argument has been met in recent times by the application to mind of the physiological theory of heredity, according to which changes produced in the mind (brain) of a parent, by association of ideas or otherwise, tend to be inherited by his offspring; so that the development of the moral sense or any other faculty or susceptibility of existing man may be hypothetically carried back into the prehistoric life of the human race, without any change in the manner of derivation supposed. At present, however, the theory of heredity is usually held in conjunction with Darwin's theory of natural selection; according to which different kinds of living things in the course of a series of generations come gradually to be endowed with organs, faculties and habits tending to the preservation of the individual or species under the conditions of life in which it is placed. Thus we have a new zoological factor in the history of the moral sentiments; which, though it be no way opposed to the older psychological theory of their formation through coalescence of more primitive feelings, must yet be conceived as controlling and modifying the effects of the law of association by preventing the formation of sentiments other than those tending to the preservation of human life. The influence of the Darwinian theory, moreover, has extended from historical psychology to ethics, tending to substitute "preservation of the race under its conditions of existence" for "happiness" as the ultimate end and standard of virtue.

Before concluding this sketch of the development of English ethical thought from Hobbes to the thinkers of the 19th century, it will be well to notice briefly the views held by different moralists on the question of free-will,—so far, that is, as they have been put forward as ethically important. We must first distinguish three meanings in which "freedom" is attributed to the will or "inner self" of a human being, viz. (1) the general power of choosing among different alternatives of action without a motive, or against the resultant force of conflicting motives; (2) the power of choice between the promptings of reason and those of appetites (or other non-rational impulses) when the latter conflict with reason; (3) merely the quality of acting rationally in spite of conflicting impulses, however strong, the non posse peccare of the medieval theologians. 3 It is obvious that "freedom" in this third sense is in no way incompatible with complete determination; and, indeed, is rather an ideal state after which the moral agent ought to aspire than a property which the human will can be said to possess. In the first sense, again, as distinct from the second, the assertion of "freedom" has no ethical significance, except in so far as it introduces a general uncertainty into all our inferences respecting human conduct. Even in the second sense it hardly seems that the freedom of a man's will can be an element to be considered in examining what it is right or best for him to do (though of course the clearest convictions of duty will be fruitless if a man has not sufficient self-control), or against the resultant force of conflicting motives; (2) the power of choice between the promptings of reason and those of appetites (or other non-rational impulses) when the latter conflict with reason; (3) merely the quality of acting rationally in spite of conflicting impulses, however strong, the non posse peccare of the medieval theologians. 3 It is obvious that "freedom" in this third sense is in no way incompatible with complete determination; and, indeed, is rather an ideal state after which the moral agent ought to aspire than a property which the human will can be said to possess. In the first sense, again, as distinct from the second, the assertion of "freedom" has no ethical significance, except in so far as it introduces a general uncertainty into all our inferences respecting human conduct. Even in the second sense it hardly seems that the freedom of a man's will can be an element to be considered in examining what it is right or best for him to do (though of course the clearest convictions of duty will be fruitless if a man has not sufficient self-control), or against the resultant force of conflicting motives; (2) the power of choice between the promptings of reason and those of appetites (or other non-rational impulses) when the latter conflict with reason; (3) merely the quality of acting rationally in spite of conflicting impulses, however strong, the non posse peccare of the medieval theologians. 3
rather than ethical; Clarke's view being that the apparently
arbitrary particularity in the constitution of the cosmos is really
only explicable by reference to creative free-will. In the ethi-
cal discussion of Shaftesbury and sentimental moralists gen-
erally this question drops naturally out of sight; and the cautious
Butler tries to exclude its perplexities as far as possible from the
philosophy of practice. But since the reaction, led by Price and
Reid, against the manner of philosophizing that had culmi-
nated in Hume, free-will has been generally maintained by the
intuitive school to be an essential point of ethics; and, in fact,
it is naturally connected with the judgment of good and ill
desert which these writers give as an essential element in their
analysis of the moral consciousness. An irresistible motive, it is
forcibly said, palliates or takes away guilt; no one can blame
himself for yielding to necessity, and no one can properly be
punished for what he could not have prevented. In answer to
this argument some necessarians have admitted that punishment
can be legitimate only if it be beneficial to the person punished;
others, again, have held that the lawful use of force is to restrain
lawless force; but most of those who reject free-will defend
punishment on the ground of its utility in deterring others from
crime, as much as in correcting or restraining the criminal on
whom it falls.

In the preceding sketch we have traced the course of English
ethical speculation without bringing it into relation with con-
temporary European thought on the same subject. And in fact almost all the systems described, from
Hobbes downward, have been of essentially native
growth, showing hardly any traces of foreign influence.
We may observe that ethics is the only department in which this
result appears. The physics and psychology of Descartes were
much studied in England, and his metaphysical system was
certainly the most important antecedent of Locke's; but
Descartes hardly touched ethics proper. So again the con-
troversy that Clarke conducted with Spinoza, and afterwards
with Leibnitz, was entirely confined to the metaphysical region.
Catholic France was a school for Englishmen in many subjects,
but not in morality; the great struggle between Jansenists and
Jesuits had a very remote interest for them. It was not till near
the close of the 18th century that the impress of the French
revolutionary philosophers began to manifest itself in England;
and even then its influence was mostly political rather than
ethical. It is striking to observe how even in the case of writers
such as Godwin, who were most powerfully affected by the
French political movement, the moral basis, on which the new
social order of rational and equal freedom is constructed, is
almost entirely of native origin; even when the tone and spirit
are French, the forms of thought and manner of reasoning are
still purely English. In the derivation of Benthamism alone—
which, it may be observed, first becomes widely known in the
French paraphrase of Dumont—an important element is supplied
by the works of a French writer, Helvetius; as
Bentham himself was fully conscious. It was from
Helvetius that he learnt that, men being universally and solely
governed by self-love, the so-called moral judgments are really
the common judgments of any society as to its common interests;
that it is therefore futile on the one hand to propose any standard
of virtue, except that of conduciveness to general happiness;
and on the other hand useless merely to lecture men on duty and
solicit them for virtue; that the moralist's proper function is rather
to exhibit the coincidence of virtue with private happiness;
that, accordingly, though nature has bound men's interests
together in many ways, and education by developing sympathy
and the habit of mutual help may much extend the connexion,
still the most effective moralist is the legislator, who by acting
on self-love through legal sanctions may mould human conduct
as he chooses. These few simple doctrines give the ground plan of
Bentham's indefatigable and lifelong labours.

So again, in the modified Benthamism which the persuasive
exposition of J. S. Mill afterwards made popular in England, the
influence of Auguste Comte (Philosophie positive, 1820-1842,
and Système de politique positive, 1851-1854) appears as the chief
modifying element. This influence, so far as it has affected
natural as distinct from political speculation, has been exercised
primarily through the general conception of human
progress; which, in Comte's view, consists in the ever-
growing preponderance of the distinctively human attributes over
the purely animal, social feelings being ranked highest among
human attributes, and highest of all the most universalized
phase of human affection, the devotion to humanity as a whole.
Accordingly, it is the development of benevolence in man,
and of the habit of "living for others," which Comte takes as the
ultimate aim and standard of practice, rather than the mere
increase of happiness. He holds, indeed, that the two are inse-
parable, and that the more altruistic any man's sentiments and
habits of action can be made, the greater will be the happiness
enjoyed by himself as well as by others. But he does not seriously
trouble himself to argue with egoism, or to weigh carefully the
amount of happiness that might be generally attained by the
satisfaction of egoistic propensities duly regulated; a supreme
unquestioning self-devotion, in which all personal calculations
are suppressed, is an essential feature of his moral ideal. Such
a view is almost diametrically opposed to Bentham's conception
of human existence; the newer utilitarianism of Mill
represents an endeavour to find the right middle path between
the two extremes.

It is to be observed that, in Comte's view, devotion to humanity
is the principle not merely of morality, but of religion; i.e. it
should not merely be practically predominant, but should be
manifested and sustained by regular and partly symbolical
forms of expression, private and public. This side of Comte's
system, however, and the details of his ideal reconstruction of
society, in which this religion plays an important part, have
had but little influence either in England or elsewhere. It is
more important to notice the general effect of his philosophy on
the method of determining the particulars of morality as well as
of law (as it ought to be). In the utilitarianism of Paley and
Bentham the proper rules of conduct, moral and legal, are
determined by comparing the imaginary consequences of
different modes of regulation on men and women, conceived as
specimens of a substantially uniform and unchanging type. It is
true that Bentham expressly recognizes the varying influences
of climate, race, religion, government, as considerations which
it is important for the legislator to take into account; but his
own work of social construction was almost entirely independent
of such considerations, and his school generally appear to have
been convinced of their competence to solve all important ethical
and political questions for human beings of all ages and countries,
without regard to their specific differences. But in the Comtian
conception of social science, of which ethics and politics are the
practical application, the knowledge of the laws of the evolution
of society is of fundamental and continually increasing import-
ance; humanity is regarded as having passed through a series of
stages, in each of which a somewhat different set of laws and
institutions, customs and habits, is normal and appropriate.
Thus present man is a being that can only be understood through
a knowledge of his past history; and any effort to construct
for him a moral and political ideal, by a purely abstract and
historical method, must necessarily be futile; whatever modifi-
cations may at any time be desirable in the positive law and morality
can only be determined by the aid of "social dynamics." This
view extends far beyond the limits of Comte's special school or
sect, and has been widely accepted.

When we turn from French philosophy to German, we find
the influence of the latter on English ethical thought almost
insignificant until a very recent period. In the 17th
century, indeed, the treatise of Pufendorf on the Law of
Nature, in which the general view of Grotius was re-
stored with modifications, partly designed to effect a
compromise with the doctrine of Hobbes, seems to have been
a good deal read at Oxford and elsewhere. Locke includes it
among the books necessary to the complete education of a gentle-
man. But the subsequent development of the theory of conduct
in Germany dropped almost entirely out of the cognizance of

German Influence on English ethics.

Englishmen; even the long dominant system of Wolff (d. 1755) was hardly known. Nor had Kant any serious influence in England until the first quarter of the 19th century. We find, however, distinct traces of Kantian influence in Whewell and other writers of the intuitional school, and at a later date it became so strong that its importance on subsequent ethical thought can scarcely be over-estimated.

The English moralist with whom Kant has most affinity is Price; in fact, Kantism, in the ethical thought of modern England, holds a place somewhat analogous to that formerly occupied by the teaching of Price and Reid among English moralists. Kant, like Price and Reid, holds that man as a rational being is unconditionally bound to conform to a certain rule of right, or "categorical imperative" of reason. Like Price he holds that an action is not good unless done from a good motive, and that this motive must be essentially different from natural inclination of any kind; duty, to be duty, must be done for duty's sake; and he argues, with more subtlety than Price or Reid, that though a virtuous act is no doubt pleasant to the virtuous agent, and any violation of duty painful, this moral pleasure (or pain) cannot strictly be the motive to the act, because it follows instead of preceding the recognition of the obligation to do it. 1 With Price, again, he holds that rightness of intention and motive is not only an indispensable condition or element of the rightness of an action, but actually the sole determinant of its moral worth; but with more philosophical consistency he draws the inference—of which the English moralist does not seem to have dreamt—that there can be no separate rational principles for determining the "material" rightness of conduct, as distinct from its "formal" rightness; and therefore that all rules of duty, so far as universally binding, must admit of being exhibited as applications of the one general principle that duty ought to be done for duty's sake. This deduction is the most original part of Kant's doctrine.

The dictates of reason, he points out, must necessarily be addressed to all rational beings as such; hence, my intention cannot be right unless I am prepared to will the principle on which I act to be a universal law. He considers that this fundamental rule of imperative "act on a maxim which thou canst will to be law universal." supplies a sufficient criterion for determining particular duties in all cases. The rule excludes wrong conduct with two degrees of stringency. Some offences, such as making promises with the intention of breaking them, we cannot even conceive universalized; as soon as every one broke promises no one would care to have promises made to him. Other maxims, such as that of leaving persons in distress to shift for themselves, we can easily conceive to be universal laws, but we cannot without contradiction will them to be such; for when we are ourselves in distress we cannot help desiring that others should help us.

Another important peculiarity of Kant's doctrine is his development of the connexion between duty and free-will. He holds that it is through our moral consciousness that we know that we are free; in the cognition that I ought to do what is right because it is right and not because I like it, it is implied that this purely rational volition is possible; that my action can be determined, not mechanically, through the necessity of operating under the maxim, but by a faculty of pleasing myself, in accordance with the laws of my true, reasonable self. The realization of reason, or of human wills so far as rational, thus presents itself as the absolute end of duty; and we get, as a new form of the fundamental practical rule, "act so as to treat humanity, in thyself or any other, as an end always, and never as a means only." We may see, too, that the notion of freedom connects ethics with jurisprudence in a simple and striking manner. The fundamental aim of jurisprudence is to realize external freedom by removing the hindrances imposed on each one's free action through the interferences of other wills. Ethics shows how to realize internal freedom by resolutely pursuing rational ends in opposition to those of natural inclination. If we ask what precisely are the ends of reason, Kant's proposition that "all rational beings as such are ends in themselves for every rational being" hardly gives a clear answer. It might be interpreted to mean that the result to be practically sought is simply the development of the rationality of all rational beings—such as men—who find to be as yet imperfectly rational. But this is not Kant's view. He holds, indeed, that each man should aim at making himself the most perfect possible instrument of reason; but he expressly denies that the perfection of others can be similarly prescribed as an end to each. It is, he says, "a contradiction to regard myself as a dutiful being, to promote the perfection of another, to a contradiction to regard it as my duty to do something for another which no other but himself can do." In what practical sense, then, am I to make other rational beings my ends? Kant's answer is that what each is to aim at in the case of others is not Perfection, but Happiness, i.e. to help them to attain those purely subjective ends that are determined for each not by reason, but by natural inclination. He explains also that to seek one's own happiness cannot be prescribed as a duty, because it is an end to which every man is inevitably impelled by natural inclination: but that just because each inevitably desires his own happiness, and therefore desires that others should assist him in time of need, he is bound to make the happiness of others his ethical end, since he cannot morally demand aid from others, without accepting the obligation of aiding them in like case. The exclusion of private happiness from the ends at which it is a duty to aim contrasts strikingly with the view of Butler and Reid, that man, as a rational being, is under a "manifest obligation" to seek his own interest. The difference, however, is not really so great as it seems; since in another part of his system Kant fully recognizes the reasonableness of the individual's regard for his own happiness. Though duty, in his view, excludes regard for private happiness, the summum bonum is not duty alone, but happiness combined with moral worth; the demand for happiness as the reward of duty is so essentially reasonable that we must postulate a universal connexion between the two as the order of the universe; indeed, the practical necessity of this postulate is the only adequate rational ground that we have for believing in the existence of God.

Before the ethics of Kant had begun to be seriously studied in England, the rapid and remarkable development of metaphysical view and method of which the three chief stages are represented by Fichte, Schelling and Hegel respectively had already taken place; and the system of the latter was occupying the most prominent position in the philosophical thought of Germany. Hegel's ethical doctrine (exposured chiefly in his Philosophie des Rechts, 1821) shows a close affinity, and also a striking contrast, to Kant's. He holds, 2

1 Singly sufficiently, the English writer who approaches most nearly to Kant is the Quakers in the latter part of the 18th century. In his Politics and Justice. Godwin's view, reason is the proper motive to acts conducing to general happiness; reason shows me that the happiness of a number of other men is of more value than my own; and the perception of this truth affords me the clue to the latter. And supposing it to be replied that the motive is really the moral uneasiness involved in choosing the selfish alternative, Godwin answers that this uneasiness, though a "constant step," in the process of volition, is a merely "accidental" step. I feel pain in the neglect of an act of benevolence, because benevolence is judged by me to be conduct which it becomes me to adopt.

2 In Kantism, as we have partly seen, the most important ontological beliefs—in God, freedom and immortality of the soul—are based on necessities of ethical thought. In Fichte's system the connexion of ethics and metaphysics still more intimate; indeed, we may compare it in this respect to Platonism: as Plato blends the most fundamental notions of each of these studies into the one idea of good, so Fichte blends them in the one idea free-will. Freedom, in his view, is once the foundation of all being. At the end of all mental action. In the systems of Schelling and Hegel, ethics again into a subordinate place; indeed, the ethical view of the former is rather suggested than completely developed. Neither Fichte nor Schelling has exercised more than the faintest and most indirect influence on ethical philosophy in England; it therefore seems best to leave the ethical doctrines of each to be explained in connexion with the rest of his system.
with Kant, that duty or good conduct consists in the conscious realization of the free reasonable will, which is essentially the same in all rational beings. But in Kant's view the universal content of this will is only given in the formal condition of "only acting as one can desire all to act," to be subjectively applied by each rational agent to his own volition; whereas Hegel conceives the universal will as objectively presented to each man in the laws, institutions and customary morality of the community of which he is a member. Thus, in his view, not merely natural inclinations towards pleasures, or the desires for selfish happiness, require to be morally resisted; but even the prompting of the individual's conscience, the impulse to do what seems to him right, if it comes into conflict with the common sense of his community. It is true that Hegel regards the conscientious effort to realize one's own conception of good as a higher stage of moral development than the mere conformity to the jural rules establishing property, maintaining contract and allotting punishment to crime, in which the universal will is first expressed; since in such conformity this will is only accomplished accidentally by the outward concurrence of individual wills, and is not essentially realized in any of them. He holds, however, that this conscientious effort is self-deceived and futile, is even the expression of a pathological vice, and requires to be subordinated to the objective social relations in which the individual finds himself placed. Of these relations the first grade is constituted by the family, the second by civil society, and the third by the state, the organization of which is the highest manifestation of universal reason in the sphere of practice.

Hegelianism appears as a distinct element in modern English ethical thought; but the direct influence of Hegel's system is perhaps less important than that indirectly exercised through the powerful stimulus which it has given to the study of the historical development of human thought and human society. According to Hegel, the essence of the universe is a process of thought from the abstract to the concrete; and a right understanding of this process gives the key for interpreting the evolution in time of European philosophy. So again, in his view, the history of mankind is a history of the necessary development of the free spirit through the different forms of political organization: the first being that of the Oriental monarchy, in which freedom belongs to the monarch only; the second, that of the Graeco-Roman republic, in which all citizens are free and equal in civil and political rights; the third is subjected to the rule of the family; while finally in the modern societies, sprung from the Teutonic invasion of the decaying Roman empire, freedom is recognized as the natural right of all members of the community. The effect of the lectures (posthumously edited) in which Hegel's "Philosophy of History" and "History of Philosophy" were expounded, has extended far beyond the limits of his special school; indeed, the predominance of the historical method in all departments of the theory of practice is not a little due to their influence. (H. S.; X.)

D. Ethics since 1879.—Ethical controversies, like most other speculative disputes, have, during the latter part of the 19th and the beginning of the 20th century, centred round Darwinian theories. The chief characteristic of English moral philosophy in its previous history has been its comparative isolation from great movements, sometimes contemporary movements, of philosophical or scientific thought. Ethics in England no less than on the continent of Europe suffered until the time of Bacon from the excessive domination of theological dogma and the traditional scholastic and Aristotelian philosophy. But the moral science of the 19th century, freed from scholastic trammels, was a genuine native product, arising out of the real problem of conduct and reaching its conclusions, at least ostensibly, by an analysis of, and an appeal to, the facts of conduct and the nature of morality. Even at the beginning of the 19th century, when the main interest of writers who belonged to the Utilitarian school was mainly political, the influence of political theories upon contemporary moral philosophy was upon the whole an influence of which the moral philosophers themselves were unconscious; and from the nature of things moral and political philosophy have a tendency to become one and the same inquiry. Mill, it is true, and Comte both encouraged the idea that society and conduct alike were susceptible of strict scientific investigation. But the attempt not only to treat ethics scientifically, but actually to subordinate the principles of conduct to the principles of existing biological science or group of sciences biological in character, was reserved for post-Darwinian moral philosophers. That attempt has not, in the opinion of the majority of critics, been successful, and perhaps what is most permanent in the contribution of modern times to ethical theory will ultimately be attributed to philosophers antagonistic to evolutionary ethics. Nevertheless the application of the historical method to inquiries concerning the facts of morality and the moral life—i.e., part of the great movement of thought to which Darwin gave the chief impetus—has caused moral problems to be presented in a novel aspect; while the influence of Darwinism upon studies which have considerable bearing upon ethics, e.g., anthropology or the study of comparative religion, has been incalculable.

The other great movement in modern moral philosophy due to the influence of German, and especially Hegelian, idealism, followed naturally for the most part from the revival of interest in metaphysics noticeable in the latter half of the 19th century.

The philosophies of Schopenhauer and Nietzsche, both discussed in England, and, while the increased interest in ultimate issues of philosophy has enormously deepened and widened men's appreciation of moral problems and the issues involved in conduct, the actual advance in ethical theory produced by such speculations has been comparatively slight. What is of lasting importance is the affirmation upon metaphysical grounds of the right of the moral consciousness to state and solve its own difficulties, and the successful repudiation of the claims of particular sciences such as biology to include the sphere of conduct within their scope and methods. And both evolutionary and idealistic ethics agree in repudiating the standpoint of narrow individualism, unlike insist upon the necessity of regarding the self as social in character, and regard the end of moral progress as only realizable in a perfect society.

It is perhaps too much to hope that the long-continued controversy between hedonists and anti-hedonists has been finally settled. But certainly few modern moral philosophers would be found in the present day ready to defend the crudities of hedonism. Certain moral philosophers, such as Mill, and certain social critics, such as Sidgwick, have arrived at a somewhat common agreement has been reached concerning the possibility of regarding pleasure as the sole motive criterion and end of moral action, though different opinions still prevail as to the place occupied by pleasure in the sumum bonum, and the possibility of a hedonistic calculus.

The failure of "laissez-faire" individualism in politics to produce that common prosperity and happiness which its advocates hoped for caused men to question the egoistic basis upon which its ethical counterpart was constructed. Similarly the comparative failure of science to satisfy men's aspirations alike in knowledge and, so far as the happiness of the masses is concerned, in practice has been largely instrumental in producing that revolt against material prosperity as the end of conduct which is characteristic of idealist moral philosophy. To this revolt, and to the general tendency to find the principle of morality in an ideal good present to the consciousness of all persons capable of acting morally, the widespread recognition of reason as the ultimate court of appeal alike in religion or politics, and latterly in economics also, has no doubt contributed largely. In the main, the revolt to which has followed the traditional course of such movements in ethics, and has reaffirmed in the light of fuller reflection the moral principles implicit in the ordinary moral consciousness. It is only in the present day that there are noticeable signs of dissatisfaction with current morality itself, and a tendency to substitute or advocate a new morality based ostensibly upon conclusions derived from the facts of scientific observation.

Darwin himself seems never to have questioned, in the sceptical direction in which his followers have applied his principles, the absolute character of moral obligation. What interested
him chiefly, in so far as he made a study of morality, was
the development of moral conduct in its primitive stages.

Darwin. He was principally concerned to show that in morality,
as in other departments of human life, it would be
necessary to accommodate a complete and abrupt gap between
human and merely animal existence, but that the instincts and
habits which contribute to survival in the struggle for existence
among animals develop into moral qualities which have a
similar value for the preservation of human and social life.

Regarding the social tendency as originally itself an instinct
developed out of parental or filial affection, he seems to suggest
that natural selection, which was the chief cause of its development
in the earlier stages, may very probably influence the
transition from purely tribal and social morality into morality
in its later and more complex forms. But he admits that natural
selection is not necessarily the only cause, and he refrains from
identifying the fully developed morality of civilized nations with
the "social instinct." Moreover, he recognizes that
qualities, e.g. loyalty and sympathy, which may have been of
great service to the tribe in its primitive struggle for existence,
may become a positive hindrance to physical efficiency (leading
as they do to the preservation of the unfit) at a later stage.

Nevertheless to check our sympathy would lead to the "deteriora-
tion of the noblest part of our nature," and the question, which
is obviously of vital importance, whether we should obey the
dictates of reason, which would urge us only to such conduct
as is conducive to natural selection, or remain faithful to the
noblest part of our nature at the expense of reason, he leaves
unsolved.

It was in Herbert Spencer, the triumphant "buccinator novi
temporis," that the advocates of evolutionary ethics found
their protagonist. Spencer looked to ideas derived
from the biological sciences to provide a solution of all the
enigmas of morality, as of most other departments of life;
and he conceived it "to be the business of moral science to
deduce from the laws of life and the conditions of existence what
kinds of action necessarily tend to produce happiness and
what kinds to produce unhappiness." It is clear, therefore,
that any moral science which is to be of value must wait until
the "laws of life" and "conditions of existence" have been
satisfactorily determined, presumably by biology and the allied
sciences; and there are few more melancholy instances of
failure in philosophy than the paucity of the actual results
attained by Spencer in his lifetime in his application of the so-
called laws of evolution to human conduct—a failure recognized
by Spencer himself. His own contribution to ethics was vitiated
at the outset by the fact that he never shook himself free from
the trammels of the philosophy which his own system was
intended to supersede. He began by disclaiming any affinity
to Utilitarianism on the part of his own philosophy. He pointed
out that the principle of the greatest happiness of the greatest
number is a principle without any definite meaning, since men
are nowhere unanimous in their standard of happiness, but
regard the conception of happiness rather as a problem to be
solved than a test to be applied. Universal happiness would
require omniscience to legislate for it and the "normal" or, as
some would say, "perfect" man to desire it; neither of these
conditions of its realization is at present in existence. Further,
the principle that "everybody is to count for one, nobody for
more than one," is equally unsatisfactory. It may be taken to
imply that the useless and the criminal should be entitled to
as much happiness as the useful and the virtuous. While it
gives no rule for private as distinct from public conduct, it
provides no real guidance for the legislator. For neither happi-
ness, nor the concrete means to happiness, nor finally the condi-
tions of its realization can be distributed; and in the end
"not general happiness becomes the ethical standard by which
legislative action is to be guided, but universal justice." Yet
the implications of this latter conclusion Spencer never fully
thought out. He accepted bodily without further questioning
the hedonistic psychology by which the Utilitarians sought to
justify their theory while he rejected the theory itself. Good,
e.g. defined by him "as conduct conducive to life," is also further
defined as that which is "conducive to a surplus of pleasures
over pains." Happiness, again, is always regarded as consisting
in feeling, as being in pleasant feeling, and there is no attempt
by the same principles of criticism which he has applied to
the Utilitarians' "happiness" to the conception of "pleasure." And, though he maintains as against the Utili-
tarians the existence of certain fundamental moral intuitions
which have come to be quite independent of any present conscious
experience of their utility, he yet holds that they are the results
of accumulated racial experiences gradually organized and
inherited. Finally, side by side with a theory of the nature of
moral obligation thus fundamentally empirical and a posteriori
in its outlook, he maintains in his account of justice the existence
of the idea of justice as distinct from a mere sentiment, carrying
with it an a priori belief in its existence and identical in its
a priori and intuitive character with the ultimate criterion of
Utilitarianism itself. The fact is that any close philosophical
analysis of Spencer's system of ethics can only result in the
discovery of a multitude of mutually conflicting and for the most
part logically untenable theories. It is frequently impossible to
discover whether he wishes by an appeal to evolutionary prin-
ciples to reinforce the sanctions and emphasize the absolute
character of the traditional morality which in the main he
accepts without question from the current opinions about con-
duct of his age, or whether he wishes to discredit and disprove
the validity of that morality in order to substitute by the aid
of the biological sciences a new ethical code. The argument
for instance, that intuitive and a priori beliefs gain their absolute
character from the fact that they are the result of continued
transmission and accumulation of past nervous modifications
in the history of the race would, if taken seriously, lead us to the
belief that ultimate ethical sanctions are to be sought, not by an
appeal to the moral consciousness, but by the investigation
of brain tissue and the relation of man's bodily organism to its
environment. Yet such a view would be totally at variance
with much that Spencer says (especially in his treatment of
justice) concerning the trustworthiness and inevitable character
of men's constant appeal to the intuitions of their moral conscious-
ness. Moreover, the very fact itself of the possibility of inheriting
acquired moral characteristics is still hotly debated by those
biologists with whom should rest the ultimate verdict. Again,
the argument that "conduct is good or bad according as its
total effects are pleasurable or painful," and that ultimately
"pleasure-giving acts are life-sustaining acts," seems to involve
Spencer in a multitude of unverified assumptions and con-
tradictory theories. In the first place it is never clear whether
Spencer regards the fact that a particular course of conduct is
accompanied by a feeling of pleasure as a test of its life-preserv-
ing and life-sustaining character, or whether he wishes us to use
as our criterion of what is pleasant in conduct the fact that the
conduct in question seems conducive to the continued existence
of man's organic life. He apparently passes from one criterion
to the other as best suits the purpose of the moment. He does
not prove the coincidence of life-sustaining and pleasant activities.
He assumes throughout that the pleasant is the opposite of what
is painful, and seems unaware of the difficulty of determining
by means of terms so highly abstract the specific character of
moral action. We find in his theory no satisfactory attempt
to discriminate between the pleasure aimed at by the altruist
and the immediate pleasure of egotistic action. Similarly he
disregards the distinction between pleasant feeling as an im-
mediate motive of conduct and the idea of the attainment of
future pleasure whether by the race or by the individual. Spencer
is involved in effect in most of the confusions and contradictions
of hedonistic psychology.

Nor is his attempt to construct a scientific criterion out of data
derived from the biological sciences productive of satisfactory
results. He is hampered by a distinction between "absolute"
and "relative" ethics definitely formulated in the last two
chapters of The Data of Ethics. Absolute ethics would deal with
such laws as would regulate the conduct of ideal man in an ideal

society, i.e. a society where conduct has reached the stage of complete adjustment to the needs of social life. Relative ethics, on the other hand, is concerned only with certain conduct as it is advantageous for that society which has not yet reached the end of complete adaptation to its environment, i.e. which is at present imperfect. It is hardly necessary to say that Spencer does not tell us how to bring the two ethical systems into correlation. And the actual criteria of conduct derived from biological considerations are almost ludicrously inadequate. Conduct, e.g., is said to be more moral in proportion as it exhibits a tendency on the part of the individual or society to become more "definite," "coherent" and "heterogeneous." Or, again, we should recognize as a test of the "authoritative" character of moral ideas or feelings the fact that they are complex and representative, referring to a remote rather than to a proximate good, remembering the while that "the sense of duty is transitory, and will diminish as fast as moralization increases." In fact, no acceptable scientific criterion emerges, and the outcome of Spencer's attempt to ascertain the laws of life and the conditions of existence is either a restatement of the dictates of the moral consciousness—vague and confusing as such—under a phraseology, or the substitution of the meaningless test of "survivability" as a standard of perfection for the usual and intelligible standards of "good" and "right."

A similar criticism might fairly be passed upon the majority of philosophers who approach ethics from the standpoint of evolution. Sir Leslie Stephen, for instance, wishes to substitute the conception of "social health" for that of universal happiness, and considers that the conditions of social health are to be discovered by an examination of the "social organism" or of "social tissue," the laws of which can be studied apart from those laws by which the individuals composing society regulate their conduct. "The social evolution means the evolution of a strong social tissue; the best type is the type implied by the strongest tissue." But on the important question as to what constitutes the strongest social tissue, or to what extent the analogy between society as at present constituted and organic life is really applicable, we are left without certain guidance. The fact is that with few exceptions evolutionary moral philosophers evade the choice between alternatives which is always presented to them. They begin, for the most part, with a belief that in ethics as in other departments of human knowledge "the more developed must be interpreted by the less developed"—though frequently in the sequel complexity or posteriority of development is erected as a standard by means of which to judge the process of development itself. They are not content to write a history of moral development, applying to it the principles by which Darwinians seek to explain the development of animal life. But the search of origins frequently leads them into theories of the nature of that moral conduct whose origin they are anxious to find quite at variance with current and accepted beliefs concerning its nature. The discovery of the so-called evolution of morality out of non-moral conditions is very frequently an unconscious subterfuge by which the evolutionist hides the fact that he is making a priori judgments upon the products of a materialistic philosophy which has still to be evolved. To say that such theories of the origin of morality would carry with it the conviction that we took for "moral" conduct was in reality something very different, and has been so throughout its history.

The legitimate inference which should follow would be the denial of the validity of those moral laws which have hitherto been regarded as absolute in character, and the substitution for all customary moral terms of an entirely new set based upon biological considerations. But it is precisely this, the only logical inference, which most evolutionary philosophers are unwilling to draw. They cannot give up their belief in customary morality. Professor Huxley maintained, for example, in a famous lecture that "the ethical progress of society depends not on imitating the cosmic process, still less in running away from it, but in combating it" (Romances Lecture, ad fin.). And very frequently arguments are adduced by evolutionists to prove that men's belief in the absolute character of moral precepts is one of the necessary means adopted by nature to carry out her designs for the social welfare of mankind. Yet the other alternative, to which such reasoning points, they are reluctant to accept. For the belief that moral obligation is absolute in character, that it is alike impossible to explain its origin and transcend its laws, would make the search for a scientific criterion of conduct to be deduced from the laws of life and conditions of existence meaningless, if not absurd.

Perhaps the one European thinker who has carried evolutionary principles in ethics to their logical conclusion is Friedrich Nietzsche. Almost any system of morality or immorality might find some justification in Nietzsche's writings, which are extraordinarily chaotic and full of the wildest exaggerations. Yet it has been a true instinct which has led popular opinion as testified to by current literature to find in Nietzsche the most orthodonx exponent of Darwinian ideas in their application to ethics. For he saw clearly that to be successful evolutionary ethics must involve the "transvaluation of all values," the "demoralization" of all ordinary current morality. He accepted frankly the glorification of brute strength. "Superiority among and all the qualities necessary for success in the struggle for existence, to which the ethics of evolution necessarily tend. He proclaimed himself, before everything else, a physiologist, and looked to physiology to provide the ultimate standard for everything that has value; and though his own ethical code necessarily involves the disappearance of sympathy, love, toleration and all existing altruistic emotions, he yet in a sense finds room for them in such altruistic self-sacrifice as prepares the way for the higher man of the future. Thus, after a fashion, he is able to reconcile the conflicting claims of egoism and altruism and succeed where most apostles of evolution fail. The Christian virtues, sympathy for the weak, the suffering, &c., represent a necessary stage to be passed through in the evolution of the Übermensch, i.e. the stage when the weak and suffering combine in revolt against the strong. They are to be superseded, not so much because all social virtues are to be scorned and rejected, as because in their effects, i.e. in their tendency to perpetuate and prolong the existence of the weak and those who are less well equipped and endowed by nature, they are anti-social in character and injurious to the survival of the strongest and most vigorous type of humanity. Consequently Nietzsche in effect maintains the following paradoxical position: he explains the existence of altruism upon egoistical principles; he advocates the total abolition of all altruism by carrying these same egoistical principles to their logical conclusion; he nevertheless appeals to that moral instinct which makes men ready to sacrifice their own narrow personal interests to the higher good of society—an instinct profoundly altruistic in character—as the ultimate justification of the ethics he enunciates. Such a position is a reduction ad absurdum of the attempt to transcend the ultimate character of those intuitions and feelings which prompt men to benevolence. Thus, though incidentally there is much to be learned from Nietzsche, especially from his criticism of the ethics of pessimism, or from the strictures he passes upon the negative morality of extreme asceticism or quietism, his system inevitably degenerates into a perfectly logical absolute egoism. The real course of history and distorts the moral facts is likely to commend itself to the sober judgment of mankind however brilliant be its exposition or ingenious its arguments. Finally, the conceptions of strength, power and masterfulness by which Nietzsche attempts to determine his own moral ideal, become, when examined, as relative and unsatisfactory as other criteria of moral action said to be deduced from evolutionary principles. Men desire strength or power not as ends but as means to ends beyond them; Nietzsche is most convincing when the Ubermensch is left undefined. Imagined as ideal man, i.e. as morality depicts him, he becomes intelligible; imagined as Nietzsche describes him he reeks back into the brute, and that distinction which chiefly separates man from the animal world out of which he has emerged, viz. his unique power of self-consciousness and self-criticism, is obliterated.

It was upon this crucial difficulty, i.e. the transition in the
evolution of morality from the stage of purely animal and unconscious action to specifically human action,—i.e. action directed by self-conscious and purposive intelligence to an end conceived as good,—that the polemic of T. H. Green and his idealistic followers fastened. It is perhaps unfortunate that metaphysical doctrines enunciated chiefly for the purposes of criticism not in themselves vitally necessary to the theory of morality proposed should have been regarded as the main contribution to ethical theory of idealist writers, and as such treated severely by hostile critics. Green's principal objection to evolutionary moral philosophy is contained in the argument that no merely "natural" explanation of the facts of morality is conceivable. The knowing consciousness,—i.e. so far as conduct is concerned the moral consciousness,—can never become an object of knowledge in the sense in which natural phenomena are objects of scientific knowledge. For such knowledge implies the existence of a knowing consciousness as a relating and uniting intelligence capable of distinguishing itself from the objects to which it relates. And more particularly the existence of the moral consciousness implies "the transition from mere want to consciousness of wanted object, from impulse to satisfy the want to effort for the realization of the wanted objects, implies the presence of the want to a subject which distinguishes itself from it." Consequently the facts of moral development imply with the emergence of human consciousness the appearance of something qualitatively different from the facts with which physiology for instance deals, imply a stratum as it were in development which no examination of animal tissues, no calculation of consequences with regard to the preservation of the species can ever satisfactorily explain. However far back we go in the history of humanity, if the presence of consciousness be admitted at all, it will be necessary to admit also the presence to consciousness of an ideal which can be accepted or rejected, of a power of looking before and after, and aiming at a future which is not yet fully realized. But this is a preliminary exigency of criticism made it necessary for Green to emphasize the metaphysic of the self, i.e. to insist upon the necessity of a critical examination of the pre-requisites of any form of self-consciousness and especially of the knowing consciousness, to such an extent that critics have lost sight of the real dependence of his metaphysic upon the direct evidence of the moral consciousness. The philosophic value, the sincerity, the breadth and depth of his treatment of moral facts and institutions have been fully recognized. What has not been adequately realized is that the metaphysical basis of his system of ethics—the argument, for example, contained in the introduction to the Prolegomena—is unfairly treated if divorced from his treatment of morals as a whole, and that it can be justly estimated only if interpreted as much as the conclusion as the starting-point of moral theory. The doctrine of the eternity of the self, for instance, against which much criticism (e.g. Taylor, The Problem of Conscience, chap. ii.) has been directed, though it is chiefly expressed in the language of epistemology, has its roots nevertheless in the direct testimony of moral experience. For morality implies a power in the individual of rising above the interests of his own narrower self and identifying himself in the pursuit of a universal good with the true interests of all other selves. Similarly the conception of the self as a moral unity arises naturally out of the impossibility of finding the sumnum bonum in a succession of transient states of consciousness such as hedonism for example postulates. Good as a true universal can only be realized by a true self, and both imply a principle of unity not wholly expressible in terms of the particulars which it unifies. But whether the idealistic interpretation of the nature of universal good be the true one, i.e. whether we are justified in identifying that self-consciousness which is capable of grasping the principle of unity with the principle of unity which it grasps is a metaphysical and theistic problem comparatively irrelevant to Green's moral theory. It would be quite possible to accept his criticisms of naturalism and hedonism while rejecting many of the metaphysical inferences which he draws. A somewhat similar answer might be returned
to those critics who find Green's use of the term "self-realization" or "self-development" as characteristic of the moral ideal unsatisfactory. It is quite easy to exhibit the futility of such a conception if understood formally for the practical purposes of moral philosophy. If the phrase be understood to mean the realization of some capacities of the self it does not appear to discriminate sufficiently between the good and bad capacities; while the realization under present conditions of all the capacities of a self is impossible. And to aim so far as is possible at all-round development would again ignore the distinction between vice and virtue. But used in the sense in which Green habitually uses it self-realization implies, as he puts it, the fulfilment by the good man of his rational capacity or the idea of a best that is in time, i.e. the distinction between the good and the bad self is never ignored, but is the fundamental assumption of his theory. And if it be urged that the expression is in any case tautological, i.e. that the good is defined in terms of self-realization and self-realization in terms of the good, it may be doubted whether any rational system of ethics can avoid a similar imputation. Green would admit that in a certain sense the conception of "good" is indefinable, i.e. that it can only be recognized in the particulars of conduct of which it is the universal form. Only, therefore, to those philosophers who believe in the existence of a criterion of morality, i.e. a universal test such as that of pleasure, happiness and the like, by which we can judge of the worth of actions, will Green's position seem absurd; since, on the contrary, such conceptions as those of "self-development" or "self-realization" seem to have a definite and positive value if they call attention to the metaphysical implications of morality and accurately characterize the moral facts. What ambiguity they possess arises from the ambiguity of morality itself. For moral progress consists in the actualization of what is already potentially in existence. The striking merit of Green's moral philosophy is that the idealism which he advocates is rooted and grounded in moral habits and institutions: and the metaphysic in which it culminates is but the idealism of the thought of the moral consciousness of the ordinary man. Nothing could be farther from Green's teaching than the belief that constructive metaphysics could, unaided by the intuitions of the moral consciousness, discover laws for the regulation of conduct.

But although Green's loyalty to the primary facts of the moral consciousness prevented him from constructing a rationalistic system of morals based solely upon the conclusions of metaphysics, it was perhaps inevitable that the revival of interest in metaphysics so prominent in his own speculations should lead to a more daring criticism of ethical first principles in other writers. Bradley's Ethical Studies had presented with great brilliancy an idealist theory of morality not very far removed from that of Green's Prolegomena. But the publication of Appearance and Reality by the same author marked a great advance in philosophical criticism of ethical postulates, and a growing dissatisfaction with current reconciliations between moral first principles and the conclusions of metaphysics. Appearance and Reality was not primarily concerned with morals, yet it inevitably led to certain conclusions affecting conduct, and it was not very long time before these conclusions were elaborated in detail. Professor A. E. Taylor's Problem of Conduct (1901) is one of the most noteworthy and independent contributions to Moral Philosophy published in recent years. But it nevertheless follows in the main Bradley's line of criticism and may therefore be regarded as representative of his school. There are two principal positions in Professor Taylor's work:—(1) a refusal to base ethics upon metaphysics, and (2) the discovery of an irreconcilable dualism in the nature of morality which takes many shapes, but may be summarized roughly as consisting in an ultimate opposition between egoism and altruism. With regard to the first of these Taylor says (op. cit. p. 4) that his object is to show that "ethics is as independent of metaphysical speculation for its principles and methods as any of the so-called 'natural sciences'; that its real basis must be sought not in philosophical theories about the nature of the Absolute or the ultimate constitution of the Universe,
but in the empirical facts of human life as they are revealed to us in our concrete everyday experience of the world and mankind, and fitted to systematize by the sciences of psychology and sociology. . . . Ethics should be regarded as a purely 'positive' or 'experiential' and not as a 'speculative' science.' With regard to the second position one quotation will suffice (op. cit. p. 183). "Altruism and egoism are divergent developments from the common psychological root of primitive ethical sentiment. Both developments are alike unavoidable, and each is ultimately irreconcilable with the other. Neither egoism nor altruism can be made the sole basis of moral theory without mutilation of the facts, nor can any higher category be discovered by the aid of which their rival claims may be finally adjusted."

Professor Taylor expounds these two theories with great brilliance of argument and much ingenuity, yet neither of them will perhaps carry complete conviction to the minds of the majority of his critics. It is curious, in the first place, to find the independence of moral philosophy upon metaphysics supported by metaphysical arguments. For whatever may be the real character of the interrelation of moral and metaphysical first principles it is obvious that Taylor's own dissatisfaction with current moral principles arises from an inability to believe in their ultimate rationality, i.e. a belief that they are untenable from the standpoint of ultimate metaphysics; and perhaps the most interesting portion of his book is the chapter entitled "Beyond Good and Bad," in which the highest and final form of the ethical consciousness of mankind is subjected to searching criticism. But further, it is becoming increasingly apparent that psychology (upon which Taylor would base morality) itself involves metaphysical assumptions; its position in fact cannot be stated except as a metaphysical position, whether that of subjective idealism or any other. And the need which most philosophers have felt for some philosophical foundation for morality arises, not from any desire to subordinate moral insight to speculative theory, but because the moral facts themselves are inexplicable except in the light of first principles which metaphysics alone can criticize.

Taylor himself attempts to find the roots of ethics in the moral sentiments of mankind, the moral sentiments being primarily feelings or emotions, though they imply and result in judgments of approval and disapproval upon conduct. But it may be doubted whether he succeeds in clearly distinguishing ethical feelings from ethical judgments, and if they are to be treated as synonymous it seems difficult to avoid the conclusion that the implications of moral "judgment" must involve a reference to metaphysics.

Moreover, it is obvious that a great part of Taylor's quarrel with current moral ideals arises from the fact that they do not commend themselves to the moral judgment, i.e. from the standpoint of real goodness they are unsatisfactory, being tainted with evil. Hence it appears difficult to reconcile what is in effect a belief in the validity of the judgments of the moral consciousness with a belief that the real source and justification of that consciousness are to be found in the very sentiments and vague moral feelings upon which it pronounces. So far it seems to be the only possible result of such a position. Taylor's polemic against metaphysical systems of ethics is based throughout upon an alleged discrepancy and separation between the facts of moral "experience," the judgments of the moral consciousness, and theories as to the nature of these which the philosophers whom he attacks would by no means accept. There is no doubt a distinction between morality as a form of consciousness and reflection upon that morality. But such a distinction neither corresponds to, nor testifies to, the existence of a distinction between morality as "experience" and morality as "theory" or "idea."

Taylor is more persuasive when he is developing his second main thesis—that of the alleged existence of an ultimate dualism in the nature of morality. His accounts of the genesis of the conceptions of obligation and responsibility as of most of the ultimate conceptions with which moral philosophy deals will be accepted or rejected to the extent to which the main contention concerning the psychological basis of ethics commends itself to the reader. But in his exposition of the fundamental contradiction involved in morality elaborated with much care and illustrative argument he appeals for the most part to facts familiar to the unphilosophical moral consciousness. He begins by finding an ultimate opposition between the instincts of self-assertion and instincts which secure the production and protection of the coming generation and even the infra-ethical world with which biology deals. He traces this opposition into the forms in which it appears in the social life of mankind (as, e.g., in the difficulty of reconciling the conflicting claims of individual self-development and self-culture and social service), and finds "a hidden root of insincerity and hypocrisy beneath all morality" (p. 243). Progress is illusory; there is no satisfactory goal to which moral development inevitably tends; religion in which some take refuge will be disowned by the inexplicable contradictions of moral conduct itself "contains and rests upon an element of make believe" (p. 48).

With Taylor's presentation of the difficulties with which morality is expected to grapple probably few would be found seriously to disagree, though they might consider it unduly pessimistic. But when he turns what is in effect a statement of certain forms of moral difficulty into an attack upon the logical and coherent character of morality itself, he is not so likely to command assent. For the difficulty all men meet with in realizing goodness, or in being moral, is not in itself evidence of an inherent contradiction in the nature of goodness as such. And what perhaps would first strike an unprejudiced critic in Taylor's examples of conflicting ideals or antagonistic yet ultimate moral judgments would be the perception that they are not necessarily moral ideals or judgments at all, and hence necessarily not ultimate.

The claims of self-culture and of social service may when considered in the abstract or in some hypothetical case appear antagonistic and irreconcilable. But when they present themselves to the individual moral consciousness it may be safely asserted (1) that there can be only one moral choice possible, i.e. that their opposition (where they are opposed) involves no conflict of duties; and (2) that whichever ideal is in the end preferred, opportunities will nevertheless be provided within its realization for the concurrent realization of activities and capacities ordinarily associated with the ideal alleged to be contradictory. For just as there is no self-realization which does not involve self-sacrifice, so there is no room for that species of egoism within the confines of morality which is incompatible with social service.

It will be clear from the foregoing account of Taylor's work that the tendency of his thought, as of that of Bradley, is by no means directed to the confirmation or re-establishment of those principles of conduct, recognized as such in the moral consciousness. Psychology or metaphysics tend in their systems to usurp the place of authority formerly assigned to ethics proper. It would be true on the whole to assert that evolutionary systems of ethics such as those of Herbert Spencer, Sir Leslie Stephen or Professor S. Alexander (Moral Order and Progress, 1890), together with the metaphysical theories of morals of which T. H. Green and Bradley and Taylor are the chief representatives, have dominated the field of ethical speculation since 1870. Nevertheless it is only necessary to mention such a work as Martineau's Types of Ethical Theory to dispel the notion that the type of moral philosophy most characteristically English, i.e. consisting in the patient analysis of the form and nature of the moral consciousness itself, has given way or is likely to give way to more ambitious and constructive efforts. Martineau's chief endeavour was, as he himself says, to interpret, to vindicate, and to systematize the moral sentiments, and if the actual exhibition of what is involved, e.g., in
moral choice is the vindication of morality Martineau may be said to have been successful. It is with his interpretation and systematization of the moral sentiments that most of Martineau's critics have found fault. It is impossible, e.g., to accept his ordered hierarchy of "springs of action" without perceiving that the real principle upon which they can be arranged in order at all must depend upon considerations of circumstances and consequences, of stations and duties, with which a strict intuitionism such as that of Martineau would have no dealing. Similarly the notion of Conscience as a special faculty giving its pronouncements immediately and without reflection cannot be maintained in the face of modern psychological analysis and is untrue to the nature of moral judgment itself. And Martineau is curiously unsympathetic to the universal and social aspect of morality with which evolutionary and idealist moral philosophers are so largely occupied. Nevertheless there have been few moral philosophers who have, apart from the idiosyncrasies of their special prepossession, set forth with clearer insight or with greater nobility of language the essential nature of the moral consciousness.

Equal in importance to Martineau's work is Professor Sidgwick's *Methods of Ethics* which appeared in 1874. The two works are alike in lofthiness of outlook and in the fact that they are devoted to the re-examination of the moral consciousness to the exclusion of alien branches of inquiry. In most other respects they differ. Martineau is much more in sympathy with idealism than Sidgwick, whose work consists in a restatement from a new and independent standpoint of the Utilitarian position. And Sidgwick has been far more sympathetic than any other moral philosopher with the exceptions of T. H. Green and Bradley in founding a school of thought. Many of his most acute critics would be the first to admit how much they owe to his teaching. Chief among the more recent of these is G. E. Moore, whose book *Principia Ethica* is an important original contribution to ethical thought. And although Dr. Hastings Rashdall (The *Theory of Good and Evil*, Oxford, 1907) is not in agreement with Sidgwick's own particular type of hedonistic theory in his own philosophical position, he occupies a point of view somewhat similar to that of Sidgwick's main attitude of Rational Utilitarianism. Rashdall's two volumes exhibit also a welcome return on the part of English thought to the proper business of the moral philosopher—the examination of the nature of moral conduct. Other works, such as Professor L. T. Hobhouse's *Morals in Evolution* or Professor E. A. Westermarck's *Origin and Development of the Moral Ideas*, testify to a continued interest in the history of morality and in the anthropological inquiries with which moral philosophy is closely connected.

Much that is of importance for moral philosophy has recently been written upon topics that more properly belong to the philosophy of religion and the theory of knowledge. J. F. McTaggart's *Studies in Hegelian Cosmology*, and his later work, *Some Dogmas of Religion*, contain interesting contributions to the theory of pleasure and of the problem of free will and determinism. A notable instance of this tendency is seen in the developments of the theory of pragmatism (q.v.), for which F. C. S. Schiller has proposed the general term "humanism." Such aspects as concern ethics include, for example, the limited indeterminism involved in the theory, the attitude of the religious consciousness expressed by William James (*Will to Believe and Pragmatism*), and the pragmatic conception of the good. And the widespread interest in social problems has produced a revival of speculation concerning questions partly political and partly ethical in character, e.g., the nature of justice. Finally it has become apparent that many problems hitherto left for political economy to solve belong more properly to the moral philosopher, and it may be confidently expected that with the increased complexity of social life and the disappearance of many sanctions of morality hitherto regarded as inviolable, the future will bring a renewed and practical interest in the theory of conduct likely to lead to fresh developments in ethical speculation.

**BIBLIOGRAPHY.**—The literature of the subject is so large in all languages that only a small selection can be given here. For further works reference may be made to subsidiary articles. See also Baldwin's *Dict. of Philos. and Psychol.* vol. iii. (1905), pp. 812 foll. (bibliography).

**HISTORY**

---

**ETHIOPIA, or AETHIOPIA (Gr. Ἀθηηαία),** the ancient classical name of a district of northern Africa, bounded on the N. by Egypt and on the E. by the Red Sea. The application of the name has varied at different times. In the Homeric poems the *Aethyopes* are the furthest of mankind both eastward and westward; the gods go to their banquets and probably the Sun sets in their country. With the growth of scientific geography they came to be located somewhat less vaguely, and indeed their name was employed as the equivalent of the Assyrian and Hebrew Cush (q.v.), the Kesh or Ekhosh of the Hieroglyphics (first found in Stele of Senwosret I., i.e. a country extending from about the 24th to the 10th degree of N. lat., while its limits to the E. and W. were doubtful. The etymology of the name, which to a Greek ear meant "swarthy-faced," is unknown, nor can we say why in official inscriptions of the Axumite dynasty the word is used as the equivalent of Habashat (whence the

2 For the topography and later history see Sudan and Abyssinia.
modern Abyssinia), which, from the context would appear to denote a tribe located in S. Arabia, whose name was rendered by the Greeks as *Abessin* and *Abiss*.

The inhabitants of Ethiopia, partly perhaps owing to their honourable mention in the Homeric poems, attracted the attention of many Greek researchers, from Democritus onwards. Herodotus divides them into two main groups, a straight-haired race and a woolly-haired race, dwelling respectively to the East and West, and this distinction is confirmed by the Egyptian monuments. From his time onwards various names of tribes are enumerated, and to some extent geographically located, most of these appellations being Greek words, applied to the tribes by strangers in virtue of what seemed to be their leading characteristics, e.g. "Long-lived," "Fish-eaters," "Troglodytes," &c.

The bulk of our information is derived from Egyptian monuments, whence it appears that, originally occupied by independent tribes, who were raided (first by Senefru or Snerfu, first king of the 11th or last of the IIIrd Dynasty) and gradually subjected by Egyptian kings (the steps in this process are traced by E. W. Budge, *The Egyptian Sudan*, 1907, i. 505 sqq.), under the XVIIIth Dynasty, Egypt was united, and governed Egypt. Three kings, administered by a viceroy (at first the Egyptian king's son), called prince of Kesh, and paying tributes in negroes, oxen, gold, ivory, rare beads, hides and household utensils. The inhabitants frequently rebelled and were as often subdued; records of these repeated conquests were set up by the Egyptian kings in the shape of stelae and temples; of the latter the temple of Amenehopt (Amenophis) III. at Soleb or Sulub seems to have been the most magnificent. Ethiopia became independent towards the 11th century B.C., when the XXIst Dynasty was reigning in Egypt. A state was founded, having for its capital Napata (mod. *Merawi*) at the foot of Jebel Barkal, "the sacred mountain," which in time became formidable, and in the middle of the 8th century conquered Egypt; an Egyptian campaign is recorded in the famous stela of King Fankhi. The fortunes of the Ethiopian (XXVth) Dynasty belong to the history of Egypt (g.e.). After the Egyptian yoke had been shaken off Egypt, about 660 B.C., Ethiopia continued independent, under kings of whom not a few are known from inscriptions. Besides a number whose names have been discovered in cartouches at Jebel Barkal, the following, of whom all but the third have left important stelae, can be roughly dated: Tandamane, son of Tirhaka (667–650), Aspera (650–600), Pankharer (600–590), Harsiof (590–535), Nastase (525–500). From the evidence of the stelae of the second (the Coronation Stele) and that of the fifth it has been inferred that the sovereignty early in this period became elective, a deputation of the various orders in the realm being (as Diodorus states), when a vacancy occurred, sent to Napata, where the chief god Amen selected out of the members of the royal family the person who was to succeed, and who became officially the god's son; and it seems certain that the priestly caste was more influential in Ethiopia than in Egypt both before and after this period. Another stela (called the Stele of Excommunication) records the expulsion of a priestly family guilty of murder (H. Schäfer, *Klio*, vi. 213), and three of the members of this family being massacred. The stela of Harsiof contains the record of nine expeditions, in the course of which the king subdued various tribes south of Meroe and built a number of temples. The stela of the last of these sovereigns, now in the Berlin Museum, and edited by H. Schäfer (Leipzig, 1901), contains valuable information concerning the state of the Ethiopian kingdom in its author's time. Shortly after his accession he was threatened with invasion by Cambyses, the Persian conqueror of Egypt, but (according to his own account) destroyed the fleet sent by the invader up the Nile, while (as we learn from Herodotus) the land-force succumbed to famine (see *Cambyse*s). It further appears that in this time and that of his immediate predecessors the capital of the kingdom had been removed from Napata, where in the time of Harsiof the temples and palaces were already in ruins, to Merê at a distance of 60 camel-hours to the south-east. But Napata retained its importance as the religious metropolis; it was thither that the king went to be crowned, and there too the chief god delivered his oracles, which were (it is said) implicitly obeyed. The local names in Nastase's inscription, describing his royal circuit, are in many cases obscure. A city named Pupps (Hierogl. Pa-Nebes) appears to have constituted the most northerly point in the empire. These Ethiopian kings seem to have made no attempt to reconquer Egypt, though they were often engaged in wars with the wild tribes of the Sudan. For the 5th and 4th centuries B.C. the history of the country is a blank. A fresh epoch was, however, inaugurated by Ergamenes, a contemporary of Ptolemy Philadelphus, who is said to have massacred the priests at Napata, and destroyed sacerdotal influence, till then so great that the king might at the priests' order be compelled to destroy himself; Diodorus attributes this measure to Ergamenes' acquaintance with Greek culture, which he introduced into his country. A temple was built by this king at Pselsis (Dakka) to Thoth. Probably the sovereignty again became hereditary. Occasional notices of Ethiopia occur from this time onwards in Greek and Latin authors, though the special treatises by Agatharchides and others are lost. According to Ptolemy, the country came to be ruled by queens named Candace. One of them was involved in war with the Romans in 24 and 23 B.C.; the land was invaded by C. Petronius, who took the fortress Premis or Ibrim, and sacked the capital (then Napata); the emperor Augustus, however, ordered the evacuation of the country without even demanding tribute. The stretch of land between Assuan (Syene) and Maharraka (Hiera Sycamnus) was, however, regarded as belonging to the Roman empire, and Roman cohorts were stationed at the latter place. To judge by the monuments it is possible that there were queens who reigned alone. Pyramids were erected for queens as well as for kings, and the position of the queens was little inferior to that of their consorts, though, so far as monumental representations go, they always yielded precedence to the latter. Candace appears to be found as the name of a queen for whom a pyramid was built at Meroë. A great builder was Netekamane, who is represented with his queen Amenatari on temples of Egyptian style in both Nubia, and at Napata, as well as at Meroë, Benaga and Naga in the distant Isle of Meroë. He belongs, probably, to the Ptolemaic age. Later, in the Roman period, the type in sculpture changed from the Egyptian. The figures are obese, especially the women, and have pronounced negro features, and the royal person is loaded with bulging gold ornaments. Of this period also there is a royal pair, Netekamane and Amenatari, imitating the names of their conspicuous predecessors. In the 4th century B.C. the state of Meroë was ravaged by the Nubas (?) and the Abyssinians, and in the 6th century its place was taken by the Christian state of Nubia (see *Dongola*).

Contrary to the opinion of the Greeks, the Ethiopians appear to have derived their religion and civilization from the Egyptians. The royal inscriptions are written in the hieroglyphic character and the Egyptian language, which, however, in the opinion of experts, steadily deteriorate after the separation of Ethiopia from Egypt. All these inscriptions have been interpreted by experts (see *Literature*) before, a vernacular came to be employed in inscriptions, written in a special alphabet of 23 signs in parallel hieroglyphic and cursive forms. The cursive is to be read from right to left, the hieroglyphic, contrary to the Egyptian method, in the direction in which the figures face. The Egyptian equivalents of six characters have been made out by the aid of bilingual cartouches. Words are divided from each other by pairs of dots, and it is clear that the forms and values of the signs are largely based on Egyptian writing; but as yet decipherment has not been attained, nor can it yet be stated to what group the language should be assigned (F. Ll. Griffith in D. R. Maciver's *Arete*, Oxford, 1909, and later researches).

Languages (October 1908), and the work of E. W. Budge cited above. A description of the chief ruins and the results of Dr. D. R. MacIver's researches in northern Nubia, begun in 1907, will be found under Sudan: Anglo-Egyptian.

The Axumite Kingdom.—About the 1st century of the Christian era a new kingdom grew up at Axum (q.v.), of which a king Zosaces is mentioned in the Periplus Maris Erythraei. Fragments of the history of this kingdom, of which there is no authentic chronicle, have been made out chiefly by the aid of inscriptions, of which the following is a list:—(1) Greek inscription of Adulis, copied by Cosmas Indicopleustes in 545, the beginning, with the king's name, lost. (2) Sabaean inscription of Ela Amida in two halves, discovered by J. Theodore Bent at Axum in 1893, and completed by E. Littmann in 1906. (3) Ethiopic inscription probably of the same king, imperfect (Littmann). (4) Trilingual inscription of Aeizanes, the Greco-Arabian version discovered by Henry Salt in 1809, for the Sabaean by Bent, and the Ethiopic by Littmann. (5) Ethiopic inscription of Aeizanes (so Littmann), son of Ela Amida, discovered by Eduard Rüppell in 1833. (6) Ethiopic inscriptions of Hetana-Danel, son of Dabra Efrem. These are all long inscriptions giving details of wars, &c. The sixth is later than the rest, which are to be attributed to the most flourishing period of the kingdom, the 4th and 5th centuries A.D. The fourth is pagan, the fifth Christian, Aeizanes having in the interval embraced Christianity. It was to this king that the emperor Constantius addressed a letter in 356 A.D.

Aeizanes and his successors style themselves kings of the Axumites, Homerites (Himyar), Raidan, the Ethiopians (Habasaq), the Sabaean, Sile, Tiamo, the Bugaites (Bega) and Kasu. This style implies considerable conquests in South Arabia, which, however, must have been lost to the Axumites by A.D. 378. They claim to rule the Kasu or Merotic Ethiopians; and the fifth inscription records an expedition along the Athbara and the Nile to punish the Nuba and Kasu, and a fragment of a Greek inscription from Meroë was recognized by Abyssinia commemorating a king of Axum. Except for these inscriptions Axumite history is dark. The rank of the sixth century we find the Axumite king sending an expedition to break the Jewish state then existing in S. Arabia, and reducing that country to a state of vassalage: the king is styled in Ethiopian chronicles Caleb (Kaleb), in Greek and Arabic documents El-Esbaa. In the 7th century a successor to this king, named Abraha or Abraham, gave refuge to the persecuted followers of Mahomet at the beginning of his career (see Arabia: History, ad init.). A few more names of kings occur on coins, which were struck in Greek characters till about A.D. 700, after which time language seems definitely to have been displaced in favour of Ethiopic or Geez; the condition of the script and the coins renders them all difficult to identify with the names preserved in the native lists, which are too fanciful and mutually contradictory to furnish of themselves even a vestige of history. For the period between the rise of Islam and the beginning of the modern history of Abyssinia there are a few notes in Arabic writers; so we have a notice of a war between Ethiopia and Nubia about 567 (C. C. Rossini in Giorn. Soc. Asiat. Ital. x. 144), and of a letter to George king of Nuba from the king of Abyssinia sometime between 580 and 642, when a Jewish queen Judith was opposing the Christian population (I. Guidi, ibid. iii. 179, 7).

The Abyssinian chronicles, it may be noted, attribute the foundation of the kingdom to Menelik (or Ibn el-Hakim), son of Solomon and the queen of Sheba. The Axumite or Menelik dynasty was driven from northern Abyssinia by Judith, but soon after another Christian dynasty, that of the Zagouë, obtained power. In 1268 the reigning prince abdicated in favour of Yekunus Amlak, king of Shoa, a descendant of the monarch overthrown by Judith (see Abyssinia).

*Ethiopic Literature*

The employment of the Geez or Ethiopic language for literary purposes appears to have begun no long time before the introduction of Christianity into Abyssinia, and its pagan period is represented by two Axumite inscriptions (published by D. H. Müller in J. T. Bent's *Sacred City of the Ethiopians*, 1894), and an inscription at Mataara (published by C. C. Rossini, *Rendicòl. Accad. Lincei*, 1896). As a literary language it survived its use as a vernacular, but it is unknown at what time it ceased to be the latter. In Sir W. Cornwallis Harris's *Highlands of Aethiopia* (1844) there is a list of rather more than 100 works extant in Ethiopic; subsequent research has chiefly brought to light fresh copies of the same works, but it has contributed some fresh titles. A conspectus of all the MSS. known to exist in Europe (over 1200 in number) was published by C. C. Rossini in 1899 (Rendicòl. Accad. Lincei, ser. v. vol. vii.); of these the largest collection is that in the British Museum, but others of various sizes are to be found in the chief libraries of Europe. R. E. Littmann (in the *Zeitschrift für Assyriologie*, xv. and xvi.) describes two collections at Jerusalem, one of which contains 385 MSS.; and Rossini (Rendicòl., 1904) a collection of MSS. of the Old Testament in the Coptic and in the Ethiopic, &c.

Other collections exist in Abyssinia, and many MSS. are in private hands. In 1893 besides portions of the Bible some 40 Ethiopic books had been printed in Europe (enumerated in L. Goldschmidt's *Bibliotheca Aethiopia*), but many more have since been published.

Geez literature is ordinarily divided into two periods, of which the first dates from the establishment of Christianity in the 5th century, and ends somewhere in the 7th; the second from the re-establishment of the Salomonic dynasty in 1268, continuing to the present time. It consists chiefly of translations, made in the first period from Greek, in the second from Arabic. It has no authors of the first or even of the second rank. Its character as a sacred and literary language is due to its translation of the Bible, which, because it is a sacred and literary language, is not made to contain 80 books, 46 of the Old Testament, and 35 of the New. These figures are most probably obtained by adding to the ordinary canonical books *Maccabees*, *Tobit*, *Judith*, *Wisdom*, *Ecclesiasticus*, *Baruch*, *Jubilees*, *Enoch*, the *Ascension of Isaiah*, *Esa IV*, *Shepherd of Hermes*, the *Syriac* or *Ancient* (Canon of the Apocalypse, the Book of Adam and Eve, and the *Antiqua*). For the distinction between canonical and apocryphal appears to be unknown to the Ethiopic Church, whose chief service to Biblical literature consists in its preservation of various apocryphal works which other parts of Christendom have lost or possess only in an imperfect form (see *Enoch*, *Jubilees*, *Book of Enoch*, &c.). It should be observed that the *Maccabees* of the Ethiopic Bible is an entirely different work from the books of that name included in the Septuagint, of which, however, the Abyssinians have a recent version made from the Vulgate; specimens of their own *Maccabees* have been published by J. Horovitz in the *Zeitschrift für Assyriologie*, vol. xx. The MSS. of the Biblical books vary very much, and none of them can claim any great antiquity; the oldest extant MS. of the four Books of Kings appears to be one in the Museo Borgian, presented by King Ameda Sion (1314) to the Virgin Mary in Jerusalem (described by N. Rouppe, *ibid.* x. 296-342). Hence P. de Lagarde supposed the Ethiopic version to have been made from the Arabic, which indeed is in accordance with a native tradition. This opinion is held by few; C. P. A. Dillmann distinguished in the case of the *Psalms* between the Old Testament and the Psalter, made from the Septuagint (probably in the Hesychian text), a class revised from Greek MSS., and a class revised from the Hebrew (probably through the medium of an Arabic version). An examination of ten chapters of St Matthew by L. Hacksch (ibid. vii. 444) led to the result that the Ethiopic version of the Gospels was made about A.D. 500, from a Syro-occidental text, and that this original translation is represented by Cod. Paris. Aeth. 32; whereas most MSS. and all printed editions contain a text influenced by the Alexandrian Vulgate, and show traces of Arabic. Rossini (*ibid.* x. 232) has made it probable that the
Abba Salâmâ, whom the native tradition identifies with Frumentius, evangelist of Abyssinia, to whom the translation of the Bible was ascribed, was in reality a Metropolitan of the early 4th century, who revised the corrupt text then current. Of the ancient translation the latest book is said to be Ecclesiasticus, translated in the year 678. The New Testament has been published repeatedly (first in Rome, 1548–1549; some letters about its publication were edited by I. Guidi in the Archivio della Soc. Rom. di Storia Patria, 1886), and C. F. A. Dillmann edited a critical text of most of the Old Testament and Apocrypha, but did not live to complete it; portions have been edited by J. Bachmann and others.

Other translations thought to belong to the first period are the Sherâta Makhbâr, ascribed to S. Pachomius; the Kerílos, a collection of homilies and tracts, beginning with Cyril of Alexandria De recta fide; and the Physiologus, a fanciful work on Natural History (edited by F. Hommel, Leipzig, 1877).

Of the works belonging to the second period much the most important are those which deal with Abyssinian history. A court official, called sahâf le'ezãsenet (secretary), having under him a staff of scribes, was employed to draw up the public annals year by year; and on these official compositions the Abyssinian histories are based. The earliest part of the Axum chronicle preserved is that recording the reign of Iyasu I. (848–854) against the Moslems; it is doubtful, however, whether even this exists in its original form, as some scholars think; according to its editor (J. Perruchon in the Journ. Asiat. for 1889) it is preserved in a recension of the time of King Zar'a Yâ'kûb. Under King Lebna Dengel (1508–1540) the annals of his four predecessors, Zar'a Yâ'kûb, Baeda Maryam, Eskender and Na'o'd (1434–1508) were drawn up; those of the first two were published by J. Perruchon (Paris, 1893); in the Journ. Asiat. for 1894 the same scholar published a further fragment of the history of Baeda Maryam, written by the tutor to the king's children, and the history of Eskender, Amda Sion II. and Na'o'd as compiled in Lebna Dengel's time. The history of Lebna Dengel was published by the same scholar (Journ. Semit. i. 274) and Rossini (Rendiconti, 1894, v. p. 617); that of his successor Claudius (1540–1559) by Conzelmann (Paris, 1895); that of his successor Minas (1550–1563) by F. M. E. Pereira (Lisbon, 1888); those of the three following kings, Sharsa Dengel, Zâ Dengel, and Yâ'kûb, by Rossini (Rendiconti, 1893). The history of the next king Sysenius (1600–1632) by Abba Merkha Dengel and Tekla Shelase was edited by Oomens (Lisbon, 1894); the manuscripts of Iyasu I., Iyasyi I., and Bâkêfia (1682–1730) by I. Guidi, with a French translation (Paris, 1903–1905); all are contemporary, and the names of the chroniclers of the last two kings are recorded. Besides these we have the partly fabulous chronicle of Lalibela (of uncertain date, but before the Salomonian dynasty was restored), edited by Perruchon (Paris, 1892); and a brief chronicle of Abyssinia, drawn up in the reign of Iyasu II. (1729–1753), embodying materials abridged, and often enlivened, was published by R. Basset, in the Journ. Asiat. for 1882 (cf. Rossini in the Rendiconti, 1893–1894, p. 668), and has since formed the basis for Abyssinian history. Many compilations of the sort exist in MS. in libraries, and great praise is bestowed on the one which E. Rüppell, when travelling in Abyssinia, ordered to be drawn up for his use. It is now in the collection of his MSS. at Frankfurt. Ethiopic scholars speak of a special "historical style" which comes from the mixture of the styles of different periods, and the admixture of Amharic phrases and idioms. The historian of the wars of Amda Sion is credited with some literary merit; most of the chroniclers have little.

The remaining literature of the second period is thought to begin somewhat earlier than these chronicles. To the time of King Yekunô Amlâk (1686–1283) the historical romance called Kôbra Nagażat (Glory of Kings) is assigned by its editor, C. Bezdol (Bavarian Academy, 1904); other scholars gave it a somewhat later date. Its purpose is to glorify the Salomonian dynasty, whence, in spite of a colophon which declares it to be a translation, it was regarded as an original work; since, however, it shows evident signs of having been translated from Arabic, Bezdol supposes that its author, Ishakh, who was one whose native language was Arabic, in which therefore he would naturally write the first draft of his book. To the time of Ysegae Sion (ob. 1594) belongs the Vision of the Prophet Habakkuk in Kartash, as also the works of Abba Salâmâ, regarded as the founder of the Ethiopic renaissance, one of whose sermons is preserved in a Cheren MS. With his name are connected the Acts of the Passion, the Service for the Dead and the translation of Philotheus, i.e. Philexenus. King Zar'a Ya'kûb composed or had composed for him as many as seven books; the most important of these is the Book of Light (Mashafa Berhân), paraphrased as Kirchenordnung, by Dillmann, who gave an analysis of its contents (Über die Regierung des Königs Zar'a Ya'kob, Berl. Acad., 1884). He also organized the compilation of the Miracles of the Virgin Mary, one of the most popular of Ethiopic books; a magnificent edition was printed by E. W. Budge in the Meux collection (London, 1900). In the same reign the Arabian chronicle of al-Makhîn was translated into Geez. Under Lebna Dengel (ob. 1540), besides the above-mentioned collection of chronicles, we hear of the translation from the Arabic of the history and martyrdom of St George, the Commentary of J. Chrysostom on the Epistle to the Hebrews, and the ascetic works of J. Saba called Arağâ' manfassâtî. Under Claudius (1540–1559) Maba Sion is said to have been inspired from the Arabic The Fast of the Fathers, a vast compilation, including the Didascalia, Apostology of Alexander, edited by Platt, London, 1834), and the Cred of Jacob Baradseus (published by Corrill, ZDMG, xxx. 417-466), and to the same reign belong the Book of Extreme Union (Mashafa Kande), and the religious romance Barlaam et Josaph, also paraphrased from the Arabic (partly edited by A. Zotenbg in Notices et Extraits, vol. xxviii.). The Confession of Faith of King Claudius has been repeatedly printed. The reign of Sharsa Dengel (ob. 1593) was marked by many literary monuments, such as the religious and controversial compilation called Mazmura Chrestos, and the translation, by a certain Solik, of the religious encyclopaedia (Mashafa Hâ’â) of the monk Nikon; an Arab merchant from Yemen, who took on conversion the name Anbâkhuk (Habakkuk). Under Ya'kûb (ob. 1603) the valuable chronicle of John of Nikiou was translated from Arabic (edited by A. Zotenbg with French translation in Notices et extraits, vol. xxvii.). Under John, about 1677, the Spiritual Medicine of Michael, bishop of Adtrit and Malig, was translated. The literature that is not accurately dated consists largely of liturgies, prayers and hymns; Ethiopic poetry is not numerous, but represents the last and most popular of the kind being an ode in praise of the Virgin, called Weddase Maryam (edited by K. Fries, Leipzig, 1892). Various hymn-books bear the names Deygos, Zemmar and Mawat'el (Antiphones); there is also a biblical history in verse called Mashafa Madbal or Metstra Zamân. Homilies also exist in large numbers, both original and translated, sometimes after the Arabic fashion in rhymed prose. Hagiography is naturally an important department in Ethiopic literature. In the great collection called Synaxar (translated originally from Arabic, but with large additions) for each day of the year there is the history of one or more saints; an attempt has been made by H. Dünnerg (1900) to derive some actual history from it. Many texts containing lives of individual saints have been issued. Such are those of Maba Sion and Gabra Chrestos, edited by Budge in the Meux collection (London, 1893); the Acts of S. Mercurius, of which a fragment was edited by Rossini (Rome, 1904); the unique MS. of the original, one of the most extensive works in the Geez language, was burned by thieves who set fire to the editor's house. The same scholar began a series of Vite Sanctorum anticoensium, while Monumenta Aethiopica hagiologica and Vite Sanctorum indigenarum have been edited by B. Turaiyev (Leipzig and St Petersburg, 1902, and Rome, 1903). Other lives have been edited by Pereira, Guidi, &c. Similar in historical value to these works is the History of the Exploits of Alexander, of which various recensions have been edited by Budge (London, 1895). See further Alexander the Great, section on the legends, ad fin.

Of Law the most important monument is the Fatha Nagażet
ETNOLOGY AND ETHNOGRAPHY

(Judgment of Kings), of which an official edition was issued by I. Guidi (Rome, 1890), with an Italian translation; it is a version probably made in the early 16th century of the Arabic code of Ibn 'Assal, of the 12th century, whose work, being meant for Christians living under Moslem rule, was not altogether suitable for an independent Christian kingdom; yet the need for such a code made it popular and authoritative in Abyssinia. The translator was not quite equal to his task, and the Brit. Mus. MS. 800 exhibits an attempt to correct it from the original.

Science can scarcely be said to exist in Gezz literature, unless a medical treatise, of which the British Museum possesses a copy, comes under this head. Philosophy is mainly represented by mystical commentaries on Scripture, such as the Book of the Mystery of Heaven and Earth, by Ba-Hailu Michael, probably of the 15th century, edited by Perruchon and Guidi (Paris, 1903). There is, however, a translation of the Book of the Wise Philosophers, made by Michael, son of Abba Michael, consisting of various aphorisms; specimens have been edited by Dillmann in his Chrestomathy, and J. Cornill (Leipzig, 1872). There is also a translation of Secundus the Silent, edited by Bachmann (Berlin, 1888).

Far more interesting is the treatise of Zara' Yaa'ku'b of Axum, composed in the year 1660 (edited by Littman, 1904), which contains an endeavour to evolve rules of life according to nature. The author reviews the codes of Moses, the Gospel and the Koran, and decides that all contravene the obvious intentions of the Creator. He also gives some details of his own life and his occupation of scribes. A less original treatise by Walda Haywat accompanies it. Epistology is represented by the diplomatic correspondence of some of the kings with the Portuguese and Spanish courts; some documents of this sort have been edited by Ce. Becchi, Documenti inediti per la storia d'Etiope (Rome, 1903); lexicography, by the vocabulary called Sawaiye. The first Ethiopic book printed was the Psalter (Rome, 1513), by John Potken of Cologne, the first European who studied the language.

See also C. C. Rossini, "Note per la storia letteraria Abissina," in Rendiconti della R. Accad. dei Lincei (1899); Fumagalli, Bibliografia Etiope (1893); Baschet, Etudes sur l'histoire de l'Ethiopie (1882); Catalogues of various libraries, especially British Museum (Wright, Paris, Zoologen, Oxford and British Museum, London). The Basset of Hamburg (Gopfschmidt). Plates illustrating Ethiopic paleography are to be found in Wright's Catalogue: an account of the illustrations in Ethiopic MSS. is given by Budge in his Life of Maba Siow; and a collection of inscriptions in the church of St. Stefano dei Monti, Rome, by Gallina in the Archivio della Soc. Rom. di Storia Patria (1888).

(D. S. M.)*

ETNOLOGY and ETHNOGRAPHY (from the Gr. θνθος, race, and λόγος, science, or γράμματες, to write), sciences which in their narrowest sense deal respectively with man as a racial unit (mankind), i.e. his development through the family and tribal stages into national life, and with the distribution over the earth of the races and nations thus formed. Though the etymology of the words permits in theory of this line of division between ethnology and ethnography, in practice they form an indivisible study of man's progress from the point at which anthropology (q.v.) leaves him.

Ethnology is the general name for investigations of the widest character, including subjects which in this encyclopædia are dealt with in detail under separate headings, such as Archaeology, Art (and allied articles), Commerce, Geography (and the headings for countries and tribes), Family, Name, Ethics, Law, Mythology, Folk-Lore (and allied articles), Philology (and allied articles), Agriculture, Architecture, Religion, Sociology, &c., &c. It covers generally the whole history of the material and intellectual development of man, as it has passed through the stages of (a) hunting and fishing, (b) sheep and cattle tending, (c) agriculture, (d) industry. It investigates his food, his weapons, tools and implements, his housing, his social, economic and commercial organization, forms of government, language, art, literature, morals, superstitions and religious systems. In this sense ethnology is the older term for what now is called sociology. At the present day the progress of research has in practice, however, restricted the "ethnologist" as a rule to the study of one or more branches only of so wide a subject, and the word "ethnology" is used with a somewhat vague meaning for any ethnological study: each country or nation has thus its own separate ethnology. It becomes more convenient, therefore, to deal with the ethnology as a special subject in each case. "Ethnography," in so far as it has a distinctive province, is then conveniently restricted to the scientific mapping out of different racial regions, nations and tribes; and it is only necessary here to refer the reader to the separate articles on continents, &c., where this is done. The only fundamental problem which need here be referred to is that of the whole question of the division of mankind into separate races at all, which is consequential on the earlier problem (dealt with in the article Anthropology) as to man's origin and antiquity.

If we assume that man existed on the earth in remote geological time, the question arises, was this pleistocene man specifically one? What evidence is there that he represented in his different habitats a series of varieties of one species rather than a series of species? The evidence is of three kinds, (1) anatomical, (2) physiological, (3) cultural and psychological.

1. Dr Robert Maudslay in his address to the Anthropological section of the British Association in 1803, said: "All the osseous remains of man which have hitherto been collected and examined point to the fact that, during the longer portion of the quaternary period, if not, indeed, from its very commencement, he had already acquired his human characteristics." By "characteristics" is here meant those anatomical ones which distinguish man from other animals, not the physical criteria of the various races. Do, then, these anatomical characteristics of pleistocene man show such differences among themselves and between them and the types of man existing to-day as to justify the assumption that there has ever been more than one species of man?

The undoubted "osseous remains" of pleistocene man are few. Burial was not practised, and the few bones found are for the most part those which have by mere chance been preserved in caves or rock-shelters. Of these the three chief "finds," in order of probable age, are the Trinil (Java) brain-cap, the lowest human skull yet described, characterized by depressed cranial arch, with a cephalic index of 70; the Neanderthal (Germany) skull, remarkable for its flat retreating curve with an index of 75–76; and the two nearly perfect skeletons found at Spel (Belgium), the skulls of which exhibit enormous brow ridges with cranial indices of 70 and 75. All these skulls, taken in conjunction with other well-authenticated human remains such as those found at La Naulette (Belgium), Shipka (Balkan Peninsula), Olmo (Italy), Predmert (Bohemia) and in Argentina and Brazil, make it possible to reconstruct anatomically the varying types of pleistocene man, and to establish the fact that in essential features the same primitive type has persisted through all time. The skeleton bones show differences so slight as to admit of pathological or other explanation. What Professor Kollmann says of man to-day was true in the remotest ages. Referring to Cuvier's statement that from a single bone it is possible to determine the very species to which an animal belongs, he says, "Precisely on this ground I have mainly concluded that the existence of several human species cannot be recognized, for we are unacquainted with a single tribe from a single bone of which we might with certainty determine to what species it belonged." Such differences as the bones exhibit are progressive modifications towards the higher neolithic and modern types, and are in themselves entirely incapable of supporting the theory that the owner of the Trinil skull, say, and the "man of Spel" belonged to separate species. All these "osseous remains" belong to the palaeolithic period, and from the cranial indices it is thus clear that palaeolithic man was long-headed. Neolithic man is, speaking generally, round-headed, and it has been urged that round-headedness is entirely synchronous with the neolithic age, and that the long-headed palaeolithic species of mankind gave place all at once to the round-headed neolithic species. The point thus raised involves the physiological as well as, indeed more than, the anatomical proofs of man's specific unity.
2. All physiologists agree that species cannot breed with species. Darwin himself laid it down as a fundamental principle. If then the palaeolithic and neolithic types represented separate species, they would be found to remain distinct through all time. This is not the case. There is evidence that extreme dolichocephaly continued into neolithic times, and was only slowly modified into brachycephaly. In the neolithic caves of Italy, Austria, Belgium, and the barrows of Great Britain, skulls of all types are found. The later cave-dwellers and early dolmen builders of Europe were at first long-headed, then of medium type, and finally in some places exclusively round-headed. In England the round-heads appear to be synchronous with the metal age, as shown by the contents of the barrows, and, as on the continental mainland, the two types gradually blended. Permanent fertility between them in prehistoric Europe is thus proved. And this is the case throughout the inhabitable globe. An examination of the osseous remains of American man supports the view that the human species has not varied since quaternary times. The palaeolithic type is to be found among modern European populations. Certain skulls from South Australia seem cast in almost the same mould as the Neanderthal. After thousands of years nearly pure descendants of quaternary man are found among living races. And man's mutual fertility in prehistory is repeated throughout historic times: strict racial purity is almost unknown. Thus the unity of the species man is preserved through the union of fertility.

3. The works of early man everywhere present the most startling resemblance. The palaeolithic implements all over the globe are all of one pattern. "The implements in distant lands," writes Sir J. Evans, "are so identical in form and character with the British specimens that they might have been manufactured by the same hands. . . . On the banks of the Nile, many hundreds of feet above its present level, implements of the European types have been discovered; while in Somaliland, in an ancient river-valley at a great elevation above the sea, Sir H.W. Seton-Karr has collected a large number of implements formed of flint and quartzite, which, judging from their form and character, might have been dug out of the drift-deposits of the Somme and the Seine, the Thames or the ancient Solent." This identity in the earliest arts is repeated in the later stages of man's culture; his arts and crafts, his manners and customs, exhibit a similarity so close as to compel the presumption that all the races are but divisions of one family. But perhaps the greatest psychological proof of man's specific unity is his common possession of language. Theodore Waits writes: "Inasmuch as the possession of a language of regular grammatical structure and fixed barbs, the man of the one race, at the same time a near relationship between all people in psychological respects. . . In the presence of this common feature of the human mind, all other differences lose their import" (Anthropology, p. 273). As Dr. J. C. Frischard urged, "the same inward and mental nature is to be recognized in all races of men. When we compare this fact with the observations, fully established, as to the specific instincts and separate psychical endowments of all the distinct tribes of sentient beings in the Universe we are entitled to draw confidently the conclusion that all human races are of one species and one family." It has been argued that stock languages imply stock races, but this assumption is untenable. There are some fifty irreducible stock languages in the United States and Canada, yet, taking into consideration the physical and moral homogeneity of the American Indian races, he would be a reckless theorist who held that there were therefore fifty separate human species. If it were so, how have they descended? There are no anthropoid apes in America, none of the ape family higher than the Cebidae, from which it is impossible to trace men. Again, in Australia there is certainly one stock language, yet there are not even Cebidae. In Caucasus there are many distinct forms of speech, yet all the peoples belong to the Caucasian division of mankind.

Man, then, may be regarded as specifically one, and thus he must have had an original cradle-land, whence the peopling of the earth was brought about by migration. The evidence tends to prove that the world was peopled by a generalized proto-human form. Each division of mankind would thus have had its pleistocene ancestors, and would have become differentiated into races by the influence of climatic and other surroundings. As to the man's cradle-land there have been many theories, but the west, or synchronous, is identical with Indio-Malaysia.

Of all animals man's range alone coincides with that of the inhabitable globe, and the real difficulty of the "cradle-land" theory lies in explaining how the human race spread to every land. This problem has been met by geology, which proves that the earth's surface has undergone great changes since man's appearance, and that continents, long since submerged, once existed, making a complete land connection from Indo-Malaysia. The evidence for the Indo-African continent has been summed up by R. D. Oldham, and proofs no less cogent are available of the former existence of an Euramerican continent, while the extension of Australia in the direction of New Guinea is more than probable. Thus the ancestor of man was free to move in all directions over the eastern hemisphere. The western hemisphere was more than probably connected with Europe and Asia, in Tertiary times, by a continent, the existence of which is evidenced by a submarine bank stretching from Scotland through the Faeroes and Iceland to Greenland, and on the other side by continuous land at what is now the Behring Straits.

Acclimatization has been urged as an argument against the cradle-land theory, but the peopling of the globe took place in inter-Glacial if not pre-Glacial ages, when the climate was much milder everywhere, and thus pleistocene man met climatic difficulties in his migrations.

Probably before the close of Palaeolithic times all the primary divisions of man were specialized in their several habitats by the influence of their surroundings. The profound effect of climate is seen in the relative culture of races. Thus, tropical countries are inhabited by savage or semi-savage peoples, while the higher races are confined to temperate zones. The primary divisions of mankind, Ethiopic, Mongolic, Caucasian, were certainly differentiated in neolithic times, and these classes had almost certainly occurred not consecutively in one area but simultaneously in several areas. A Negro was not metamorphosed into a Mongol, not the latter into a White, but the several semi-simian precursors under varying environments developed into generalized Negro, generalized Mongol, generalized Caucasian.

Taking, then, these three primary divisions as those into which human beings have been distributed, we come to consider the forms which have developed out of these stock races: the various people of Europe, Asia, and Africa, and then those of the other world.
which it is most reasonable broadly to divide mankind they may be analysed as to their racial constituents and their habitats as follows:

1. Caucasian or White Man is best divided, following Huxley, into (a) Xanthochroii or "fair whites" and (b) Melanochroii or "dark whites." (a) The first—tall, with almost colourless skin, blue or grey eyes, hair from straw colour to chestnut, and skulls varying as to proportionate width—are the prevalent inhabitants of Northern Europe, and the type may be traced into North Africa and eastward as far as India. On the south and west it mixes with that of the Melanochroii and on the north and east with that of the Mongoloids. (b) The "dark whites" differ from the fair whites in the darkening of the complexion to brownish and olive, and of the eyes and hair to black, while the stature is somewhat lower and the frame lighter. To this division belong a large part of those classed as Celts, and of the populations of Southern Europe, such as Spaniards, Greeks and Arabs, extending as far as India, while endless intermediate grades between the two white types testify to ages of intermingling.

Besides these two main types, the Caucasian division of mankind has been held with much reason to include such aberrant types as the Eskimo, the Polynesian races of the southern Pacific, Samoans, Hawaiians, Maori, and the present Malayan tribes of the archipelago, sometimes termed Indonesians, represented by the Dyaks of Borneo and the Battaks of Sumatra, the Todas of India and the Ainus of Japan.

2. Mongolic or Yellow Man predominates over the vast area lying east of a line drawn from Lapland to Siam. His physical characteristics are a short squat body, a yellowish-brown or coppery complexion, hair lank, straight and black, flat small nose, broad skull, usually without prominent brow-ridges, and black oblique eyes. Of the typical Mongolic races the chief are the Chinese, Tibetans, Burmese, Siamese; the Finnic group of races occupying Northern Europe, such as Finns, Lapps, Samojedes and Ostyaks, and the Arctic Asiatic group represented by the Chukchis and Kamchadales; the Tunguses, Gilyaks and Golds north of, and the Mongols proper west of, Manchuria; the pure Turkish peoples and the Japanese and Koreans. Less typical, but with the Mongolic elements so predominant as to warrant inclusion, are the Malay peoples of the eastern archipelago. Lastly, though differentiated in many ways from the true Mongol, the American and Australian aborigines, the Neolithic Fuegians must be reckoned in the Yellow division of mankind.

3. Negroid or Black Man is primarily represented by the Negro of Africa between the Sahara and the Cape district, including Madagascar. The skin varies from dark brown to brown-black, with eyes of the same colour, and hair usually black and always crisp or woolly. The skull is narrow, with orbital ridges not prominent, the jaws protrude, the nose is flat and broad, and the lips thick and everted. Two important families are classed in this division; some authorities hold, as special modifications of the typical Negro to-day, others as actually nearer the true generalized Negroid type of neolithic times. First are the Bushman of South Africa, diminutive in stature and of a yellowish-brown colour; the neighbouring Hottentot is believed to be the result of crossing between the Bushman and the true Negro. Second are the large Negrito family, represented in Africa by the dwarf races of the equatorial forests, the Akkas, Batwas, Wochaus and others, and beyond Africa by the Andaman Islanders, the Aetas of the Philippines, and probably the Senungs and other aboriginal tribes of the Malay peninsula. The Negroid type seems to have been the earliest predominant in the South Sea islands, but it is impossible to say certainly whether it is itself derived from the Negrito, or the latter is a modification of it, as has been suggested above. In Melanesia, the Papuans of New Guinea, of New Caledonia, and other islands, represent a more or less Negroid type, as did the now extinct Tasmanians.

Excluded from this survey of the group of Man are the aborigines of Australia, whose ethnical affinities are much disputed. Probably they are to be reckoned as Dravidians, a very remote blend of Caucasian and Negro man. For a detailed discussion of the branches of these three main divisions of Man the reader must refer to articles under race headings, and to NEGRO; NEGROES; MALAYS; INDIANS, NORTH AMERICAN; AUSTRALIA; AFRICA; &c., &c.

ETHYL, in chemistry, the name given to the alkyl radical CH₃. The compounds containing this radical are treated under other headings; the hydrine is better known as ethane, the alcohol, C₂H₅OH, is the ordinary alcohol of commerce, and the oxide (C₂H₅)₂O is ordinary ether.

ETHYL CHLORIDE, or Hydrochloric Ether, C₂H₅Cl, a chemical compound prepared by passing dry hydrochloric acid gas into absolute alcohol. It is a colourless liquid with a sweetish burning taste and an agreeable odour. It is extremely volatile, boiling at 2.5 °C. (54.5 °F.), and is therefore a gas at ordinary room temperatures; it is stored in glass tubed fitted with screw-capped nozzles. The vapour burns with a smoky green-edged flame. It is largely used in dentistry and slight surgical operations to produce local anaesthesia (q.v.), and is known by the trade-name kelene. More volatile anaesthetics such as anestyle or anaestyl and caryl are produced by mixing with methyl chloride; a mixture of ethyl and methyl chlorides with ethyl bromide is known as somnon.

ETHYLENE, or Ethene, C₂H₄, or H₂C=CH₂, the first representative of the series of olefine hydrocarbons, is found in coal gas. It is usually prepared by heating a mixture of ethyl alcohol and sulphuric acid. G. S. Newth (Journ. Chem. Soc., 1901, 79, p. 915) obtains a purer product by dropping ethyl alcohol into syrupy phosphoric acid (sp. gr. 1.75) warmed to 200 °C., subsequently raising the temperature to 220 °C. It can also be obtained by the action of sodium on ethylidene chloride (B. Tollens, Ann., 1866, 137, p. 311); by the reduction of copper acetylide with zinc dust and ammonia; by heating ethyl bromide with an alcoholic solution of caustic potash; by passing a mixture of carbon bisulphide and sulphurised hydrogen over red-hot copper; and by the electrolysis of a concentrated solution of potassium succinate,

\[(\text{CH}_2\text{C}O\text{COOH})_2 + 2\text{H}_2\text{O} = \text{C}_2\text{H}_4 + 2\text{CO}_2 + 2\text{KOH} + \text{H}_2\text{O}\]

It is a colourless gas of somewhat sweetish taste; it is slightly soluble in water, but more so in alcohol and ether. It can be liquefied at -118 °C., under a pressure of 423 atmos. It solidifies at -181 °C. and melts at -169 °C. (K. Olszewski); it boils at -105 °C. (L. P. Cailllet), or -106 °C. to -108 °C. (K. Olszewski). Its critical temperature is 13 °C., and its specific gravity is 0.6784 (air = 1). The specific gravity of liquid ethylene is 0.386 (3 °C.). Ethylene burns with a bright luminous flame, and forms a very explosive mixture with oxygen. For the combustion of ethylene see FLAME. On strong heating it decomposes, giving, among other products, carbon, hydrogen and acetylene (M. Berthelot, Ann., 1866, 137, p. 311). Ethylene, being a free radical, is capable of forming addition products, e.g. it combines with hydrogen in the presence of platinum black, to form ethane, C₂H₆, with sulphur trioxide to form carbyl sulphate, C₂H₄(SO₃), with hydrobromic and hydriodic acids at 100 °C. to form ethyl bromide, C₂H₅Br, and ethyl iodide, C₂H₅I, with sulphuric acid at 160-170 °C. to form ethyl sulphuric acid, C₂H₅SO₃H, and with hypochlorous acid to form glycol chlorhydrin, CH₂CH₂OH. Dilute potassium permanganate solution oxidises it to ethylene glycol, HO-CH₂CH₂OH, whilst fuming nitric acid converts it into oxalic acid. Several compounds of ethylene and metallic
ETIENNE—ETNA

chlorides are known; e.g. ferric chloride in the presence of ether at 150° C. gives \( \text{C}_2\text{H}_5\text{FeCl}_3\cdot 2\text{H}_2\text{O} \) (J. Kachtler, *Ber.*, 1899, 2, p. 510), while platinum bichloride in concentrated hydrochloric acid solution absorbs ethylene, forming the compound \( \text{C}_2\text{H}_5\text{PtCl}_3 \) (K. Birnbaum, *Ann.*, 1868, 145, p. 60).

**ÉTIENNE, CHARLES GUILLAUME** (1778-1845), French dramatist and miscellaneous writer, was born near Saint Dizier, Haute Marne, on the 5th of January 1778. He held various municipal offices under the Revolution and came in 1796 to Paris, where he produced his first comedy, *Le Rêveur*. He continued his collaboration with Antoine Frédéric Gresnick. Although Étienne continued to write for the Paris theatres for twenty years from that date, he is remembered chiefly as the author of one comedy, which excited considerable controversy. *Les Deux Gendres* was represented at the Théâtre Français on the 11th of August 1810, and procured for its author a seat in the Academy. A rumour was put in circulation that Étienne had drawn largely on a manuscript play in the imperial library, entitled *Conaxa, ou les gendres dupes*. His rivals were not slow to take up the charge of plagiarism, to which Étienne replied that the story was an old one (it existed in an old French fabliau) and had already been treated by Alexis Piron in *Les Fils ingrats*. He was, however, driven later to make admissions which at least showed a certain lack of candour. The bitterness of the attacks made on him was no doubt in part due to his position as editor-in-chief of the official *Journal de l'Empire*. His next play, *L'Etrangrante* (1812), hardly maintained the high level of *Les Deux Gendres*; the patriotic opera *L'Oriflamme* and his lyric masterpiece *Joconde* date from 1814. Étienne had been secretary to *Le Rêveur*. In 1815 he announced that it had accompanied Napoleon throughout his campaigns in Italy, Germany, Austria and Poland. During these journeys he produced one of his best pieces, *Brueys et Paladar* (1807). During the Restoration Étienne was an active member of the opposition. He was seven times returned as deputy for the department of Meuse, and was in full sympathy with the revolution of 1830, but the reforms actually carried out did not fulfill his expectations, and he gradually retired from public life. Among his other plays may be noted: *Les Deux Mères, Le Pacha de Suresnes, et La Petite École des pères*, all produced in 1802, in collaboration with his friend Gaugirand de Nanteuil (1778-1830). With Alphonse Dieudonné Martinville (1779-1839) he wrote *Histoire du Théâtre Français* (4 vols., 1802) during the revolutionary period. Étienne was a bitter opponent of the romanticists, one of whom, Alfred de Vigny, was his successor and peguyrist in the Academy. He died on the 13th of March 1845.

His *Œuvres* (6 vols., 1845-1853) contain a notice of the author by L. Thiers.

**ETIQUETTE.** A term for ceremonial usage, the rules of behaviour observed in society, more particularly the formal rules of ceremony to be observed at court functions, &c., the procedure, especially with regard to precedence and promotions in an organized body or society. Professions, such as the law, medicine, observe a code of etiquette, which the members must observe as protecting the dignity of the profession and preventing injury to its members. The word is French. The O. Fr. *estiquet* or *estiquet* meant a label, or "ticket," the true English derivative. The ultimate origin is Teutonic, from *sticken*, to post up, stick, affix. Cotgrave explains the word in French as a billet for the benefit or advantage of him that receives it, a form of introduction and also a notice affixed at the gate of a court of law. The development of meaning in French from a label to ceremonial rules is not difficult in itself, but, as the *New English Dictionary* points out, the history has not been clearly established.

**ETNA** (Gr. *Aetn*, from *alēa*, burn; Lat. *Aetna*), a volcano on the east coast of Sicily, the summit of which is 18 m. N. by W. of Catania. Its height was ascertained to be 10,758 ft. in 1900, having decreased from 10,870 ft. in 1867. It covers about 450 sq. miles, and by rail the distance round the base of the mountain is 86 m., though, as the railway in some places travels high, the correct measurement is about 91 m. The height cannot have been very different in ancient times, for the so-called Torre del Filosofo, which is only 1188 ft. below the present summit, is a building of Roman date. The shape is that of a truncated cone, interrupted on the west by the Valle del Bove, a huge sterile abyss, 3 m. wide, bounded on three sides by perpendicular cliffs (2000 to 4000 ft.). Its south-west portion, which is the deepest, was perhaps the original crater. There are also some 200 subsidiary cones, some of them over 3000 ft. high, which have risen over lateral fissures. On the slopes of the mountain there are many outcrops of volcanic rock, distinguished by Straza (vi. p. 273 ft.). The lowest, up to about 6000 ft., consist of white alabaster (*Biot alba*). A few oaks and red beeches occur, while chestnut trees grow anywhere between 1000 and 3500 ft. In the third and highest zone the vegetation is stunted, and there is a narrow zone of sub-Alpine shrubs, but no Alpine flora. In the last 2000 ft. five phanerogamous species only are to be found, the first three of which are peculiar to the mountain: *Seneo elitensis* (which is found quite close to the crater), *Anthemis elitensis*, *Robortia taraxacoides*, *Tanacetum vulgare* and *Astragalus siculus*. No trace of animal life is to be found in this zone; for the greater part of the time it is a land of snow. At the end of summer this has almost all melted, except for that preserved in the covered pits in which it is stored for use for cooling liquors, &c., in Catania and elsewhere. The ascent is best undertaken in summer or autumn. From the village of Nicolosi, 9 m. to the N.W. of Catania, about 7 or 8 hours are required to reach the summit.

Thucydides mentions eruptions in the 8th and 5th centuries B.C., and others are mentioned by Livy in 125, 121 and 43 B.C. Catania was overwhelmed in 1169, and many other serious eruptions are recorded, notably in 1669, 1830, 1852, 1865, 1879, 1886, 1892, 1899 and March 1910.

According to Lyell, Etna is rather older than Vesuvius—perhaps of the same geological age as the Norwich Crag. At Trezza, on the eastern base of the mountain, basaltic rocks occur associated with fossiliferous Pliocene clays. The earliest eruptions of Etna are older than the Glacial period in Central and Northern Europe. If all the minor cones and monticules could be stripped from the mountain, the diminution of bulk would be extremely slight. Lyell concluded that, although no approximation can be given of the age of Etna, "its foundations were laid in the earliest, if not in the very commencement of the earth's history. From the slope of the strata from one central point in the Val del Bue he further concluded that there once existed a second great crater of permanent eruption. The rocks erupted by Etna have always been very constant in composition, viz. varieties of basaltic lava and tuff containing little or no olivine—the rock type known as labradorite. At Acireale the lava has assumed the prismatic or columnar form in a striking manner; at the rock of Acì it is in parts spheroidal. The Grotte des Chèvres has been regarded as an enormous gas-bubble in the lava. The remarkable stability of the mountain appears to be due to the innumerable dikes which penetrate the lava flows and tuff beds in all directions and thus bind the whole mass together.

From the earliest times the mountain has naturally been the subject of legends. The Greeks believed it to be either the mountain with which Zeus had crushed the giant Typhon (so Pindar, *Pyth.* i. 34 seq.; *Aeschylus, Prometheus Vinctus*, 351 seq.; Strabo xiii. p. 626), or Enceladus (Virgil, *Georg.* i. 471; Oppian, *Cygn. i.* 273), or the workshop of Hephaestus and the Cyclopes (*Cic. de divin.* ii. 19; cf. Lucil., *Aetna*, 41 seq., Solin, in *De fure* (?7) 7, 21, 61., &c.). From the 1879 eruption, attempts were made to explain the phenomena which it presented by natural causes (e.g. Lucretius vi. 639 seq.; Lucilius, *Aetna*, 511 seq.). Ascents
of the mountain were not infrequent in those days—one was made by Hadrian.

See Sartorius von Waltershausen, Atlas des Ätna (Leipzig, 1880); E. Chais, Carta Volcannografica e topografica dell'Etne (showing lava streams up to 1882); G. de Lorenzo, L'Etne (Bergamo, 1907).

ETNA, a borough of Allegheny county, Pennsylvania, U.S.A., in the western part of the state, on the W. bank of the Allegheny river (about 5 m. from its junction with the Monongahela), and about 2 m. N. of the city of Pittsburgh, of which it is a suburb. Pop. (1880) 2334; (1890) 3767; (1900) 5384 (1702 foreign-born) (1910) 5830. It is served by the Pennsylvania railway and by electric lines. Among its industrial establishments are rolling mills, tube and pipe works, furnaces, steel mills, a brass foundry, and manufactories of railway supplies, boxes, asbestos coverings, enamel work and ice. The city's industrial history dates from 1820, when a small factory for the manufacture of scythes and sickles was set up. Natural gas, piped from Butler county, was early used here as a fuel in the iron mills. Etna, formerly called Steuart's Town, was incorporated as a borough in 1869.

ETON, a town of Buckinghamshire, England, on the north (left) bank of the river Thames, opposite Windsor, within which parliamentary borough it is situated. Pop. of urban district (1911) 3301. The town is noted for its college, the British public school of the ancient English public schools. The "King's College of Our Lady of Eton beside Windsor" was founded by Henry VI. in 1440-1441, and endowed mainly from the revenues of the alien priories suppressed by Henry V. The founder followed the model established by William of Wykeham in his foundations of Winchester and New College, Oxford. The original foundation at Eton consisted of a provost, 10 priests, 4 clerks, 6 choristers, a schoolmaster, 25 poor and indigent scholars, and the same number of poor men or bedsemen. In 1443, however, Henry considerably altered his original plans; the number of scholars was increased to 70, and the number of bedsemen reduced to 13. A connection was then established, and has been maintained ever since, though in a modified form, between Eton and Henry's foundation of King's College, Cambridge. One of the king's chief advisors was William of Wykeham, who had been master of Winchester College, and was appointed provost of Eton in 1443. Among further alterations to the foundation in this year was the establishment of commensales or commoners, distinct from the scholars; and these under the name of "opipada" now form the principal body of the college. The college, founded at the beginning of the Henry VII period at the close of Henry's reign; while Edward IV. curtailed its possessions, and was at first desirous of amalgamating it with the ecclesiastical foundation of St. George, Windsor Castle. In 1506 the annual revenue amounted to £652; and through benefactions and the rise in the value of property the college has grown to be very richly endowed. In 1570 commissioners under an act of 1588 appointed the governing body of the college to consist of the provost of Eton, the provost of King's College, Cambridge, five representatives nominated respectively by the university of Oxford, the university of Cambridge, the Royal Society, the lord chief justice and the masters, and four representatives chosen by the rest of the governing body. By this body the foundation was in 1872 made to consist of a provost and ten fellows (not priests, but merely the members of the governing body other than the provost), a headmaster of the school, and a lower master, at least seventy scholars (known as "collegers"), and not more than two chaplains or conductors. Originally it was necessary that the scholars should be born in England, of lawfully married parents, and be between eight and sixteen years of age; but according to the statutes of 1872 the scholarships are open to all boys who are British subjects, and (with certain limitations as to the exact date of birth) between twelve and fifteen years of age. A number of foundation scholarships for King's College, Cambridge, are open for competition amongst the boys; and there are besides several other valuable scholarships and exhibitions, most of which are tenable only at Cambridge, some at Oxford, and some at either university. The teaching embraces the customary range of classical and modern subjects; but until the first half of the 19th century the nominal course of instruction remained almost wholly classical; and although there were masters for other subjects, they were unconnected with the general business of the school, and were attended at extra hours.

The school buildings were founded in 1441, but the whole original structure was not completed till fifty years later. The older buildings consist of two quadrangles, built partly of freestone but chiefly of brick. The outer quadrangle, or school-yard, is enclosed by the chapel, upper and lower schools, the original scholars' dormitory ("long chamber"), now transformed, and masters' chambers. It has in its centre a bronze statue of the royal founder. The buildings enclosing the inner or lesser quadrangle contain the residence of the fellows, the library, hall and various offices. The chapel, on the south side of the school-yard, represents only the choir of the church which the founder originally intended to build; but as this was not completed Waynflete added an ante-chapel. The chapel was built upon a raised platform of stone, as was the hall, in order to lift it above the flood-level of the Thames. It contains some interesting monuments of provosts of the college and others, and at the west end of the ante-chapel is a fine marble statue of the founder in his royal robes, by John Bacon. A chantry or donation-house of Ralph Lipton (provost 1505-1535), whose most notable monument is the fine tower between the school-yard and the cloisters to the east; though other parts of his building also remain. The space enclosed by two buttresses on the north side of the chapel, at the point where steps ascend to the north door, is the model of the peculiar form of court for the game of files which takes name from Eton, with its "buttress" (represented by the projecting balustrade), the ledges round the walls, and the step dividing the floor into two levels. From the foundation of the college the chapel was used as the parish church until 1854, and not until 1875, after the alteration of the ancient constitution which had secularized the foundation, was the parish of Eton created into a separate vicarage. The chapel does not accommodate the whole school; and a new chapel, from the designs of Sir Arthur Blomfield, is used by the lower school. The library contains many manuscripts (notably an Oriental and Egyptian collection) and rare books; and there is also a library for the use of the boys. The college in modern times has far outgrown its ancient buildings, and new buildings, besides the lower chapel, include the new schools, with an observatory, a chemical laboratory, science schools and boarding-houses. In 1908 King Edward VII opened a fine range of buildings erected in honour of the Old Etonians who served in the South African War, and in memory of those who fell there. The architect was Mr. L. K. Ball, an old Etonian. The buildings include a school hall, a domed octagonal library, and a classical museum.

The principal annual celebration is held on the 4th of June, the birthday of King George III., who had a great kindness for the school. This is the speech-day; and after the ceremonies in the school a procession of boats takes place on the Thames. In the sport of rowing Eton occupies a unique position among the public schools, and a large proportion of the oarsmen in the annual Oxford and Cambridge boat-race are alumni of the school. Another annual celebration is the occasion of the contest between collegers and oppidans at a peculiar form of football known as the wall game, from the fact that it is played against a wall bordering the college playing-field. This game takes place on St. Andrew's Day, the 30th of November. The field game of football commonly played at Eton has also peculiar rules. The annual cricket match between Eton and Harrow schools, at Lord's ground, London, is always attended by a large and fashionable gathering. A singular custom termed the "Monem," of unknown origin, but first mentioned in 1561, was observed here triennially on Whitt-Tuesday. The last celebration took place in 1844, the ceremony being abolished just before it fell due in 1847. It consisted of a procession of the boys in a kind of military order, with flags and music, headed by their "captain," to a small mound called Salt Hill, near the Bath road, where they levied contributions,
ÉTRETAT—ETRURIA

or “salt,” from the passers-by and spectators. The sum collected sometimes exceeded £1000—the surplus, after deducting certain expenses, became the property of the captain of the school.

The average number of pupils at Étretat exceeds 1000.

See E. S. Creasy, Memoirs of Eminent Etruscans, with Notices of the Early History of the College (1850); Sketches of Étretat (1873); Sir H. C. Maxwell Lyte, History of Étretat College from 1450 to 1875 (1875); J. Heneage Jesse, Memoirs of Celebrated Etruscans (1875); The Étretat Portrait Gallery, by a Barrister of the Inner Temple (1875); A. C. Benson, Pictes Etrusciens (1899); L. Cost, History of Étretat College (1899).

ÉTRETAT, a watering-place of France, in the department of Seine-Inférieure, on the coast of the English Channel, 16½ m. N. by E. of Havre by road. Pop. (1906) 1982. It is situated between fine cliffs in which, here and there, the sea has worn archways, pinnacles and other curious forms. The small stream traversing the valley, at the extremity of which Étretat lies, flows underground for some distance but rises to the surface on the beach. A Roman road and aqueduct and other Roman and Gallic remains have been discovered. The church of Notre-Dame, a Romanesque building, with a nave of the 11th century and a central tower and choir of the 12th century, is a fine example of the Norman architecture of those periods. Fishing is carried on, though there is no port and the fishermen haul their boats up to the beach; this old bulks (caloge) serve as sheds and even as dwellings. Étretat sprang into popularity during the latter half of the 19th century, largely owing to the frequent references to it in the novels of Alphonse Karr.

ETRURIA, an ancient district of Italy, the extent of which varied considerably, and, especially in the earliest periods, is very difficult to define (see section Language). The name is the Latin equivalent of the Greek Τυρρηνία or Τυρρηνοί, which is used by Latin writers also in the forms Tyrrhenia, Tyrrenii; the Romans also spoke of Tusci, whence the modern Tuscany (q.v.). In early times the district appears to have included the whole of N. Italy from the Tiber to the Alps, but by the end of the 5th century B.C. it was considerably diminished, and about the year 100 B.C. its boundaries were the Arno (Arno), the Apennines and the Tiber. In the division of Italy by Augustus it formed the seventh regio and extended as far north as the river Macra, which separated it from Liguria.

History.—The authentic history of Etruria is very meagre, and consists mainly in the story of its relations with Carthage, Greece and Rome. At some period unknown, prior to the 6th century, the Etruscans became a seafaring people and extended their commerce and navigation by sea far and wide over Manius, Felix, Melpum, and perhaps Hadria and Ravenna (Etruria Circumpadana), but also southwards into Latium and Campania. The chronology of this expansion is entirely unknown, nor can we recover with certainty the names of the cities which constituted the two leagues of twelve founded in the conquered districts on the analogy of the original league in Etruria proper (below). In the early history of Rome the Etruscans play a prominent part. According to the semi-historical tradition they were the third of the constituent elements which went to form the city of Rome. The tradition has been the subject of much controversy, and is still an unsolved problem. It is practically certain, however, that there is no foundation for the ancient theory (cf. Prop. iv. [v.] 1. 31) that the third Roman tribe, known as Luceres, represented an Etruscan element of the population, and it is held by many authorities that the tradition of the Tarquin kings of Rome represents, not an immigrant wave, but the temporary domination of Etruscan lords, who extended their conquests some time before 600 B.C. over Latium and Campania. This theory is corroborated by the fact that during the reign of the Tarquin kings Rome appears as the mistress of a district including part of Etruria, several cities in Latium, and the whole of Campania, whereas our earliest picture of republican Rome is that of a small state in the midst of enemies. For this problem see further under Rome: History, section "The Monarchy."

After the expulsion of the Tarquins the chief events in Etruscan history are the vain attempt to re-establish themselves in Rome under Lars Porsena of Clusium, the defeat of Octavius Mamillius, son-in-law of Tarquinius Superbus, at Lake Regillus, and the treaty with Carthage. This last event shows that the Etruscan power was formidable, and that by means of their fleet the Etruscans held under their exclusive control the commerce of the Tyrrenhian Sea. By this treaty Corsica was assigned to the Etruscans while Carthage obtained Sardinia. Soon after this, decay set in. In 474 the Etruscan fleet was destroyed by Hiero I. (q.v.) of Syracuse; Etruria Circumpadana was occupied by the Gauls, the Campanian cities by the Samnites, who took Capua (see CAMPIAN) in 425, and in 396, after a ten years' siege, Veii fell to the Romans. The battle of the Vadimonian Lake (309) finally extinguished Etruscan independence, though for nearly two centuries still the prosperity of the Etruscan cities far exceeded that of Rome itself. Henceforward Etruria is finally merged in the Roman state.

ETRUSCAN ANTIQUITIES

The large recent discoveries of Etruscan objects have not materially altered the conclusions arrived at a generation ago. It is not so much our appreciation of the broad lines of the manners and arts of the Etruscans that has altered as our understanding of the geographic and social causes which made them what they were. One great difficulty in the study of the remains is that a very large portion of them have been found by unofficial excavators who have been naturally unwilling to tell whence they came, and that certain other excavations, such as those carried out by Comm. Barnabei for the Villa Giulia museum, have been carried out under conditions which help but little towards increasing our knowledge. The increase has, however, been steady, even if not all one could wish.

Ethnology.—The origin of the Etruscans will most likely never be absolutely fixed, but their own tradition (Tacitus, Ann. iv. 55) that they came out of Lydia seems not impossible. Herodotus (i. 94) and Strabo (v. 220) tell of Lydians landing at the mouth of the Po and crossing the Apennines into Etruria. Thus it seems certain that though the earliest immigrants, known to the later Etruscans as the Rasena, may have come down from the north, still they were joined by a migration from the east before they had developed a civilization of their own, and it is this double race that became the Etruscans as we know them in tradition and by their works. To give a date to the migration of the Rasena from the north, for which the only evidence is the fact that the Etruscan language is found in various parts of north Italy, is impossible, but we can perhaps give an approximate one to the coming of the Lydians or Tyrrenhians (Thuc. iv. 109; Herod. i. 57). We know that there was a great wave of migration from Greece to Italy about 1000 B.C., and as the earliest imported Greek objects found in the tombs cannot be dated many generations later than this, this year may be considered as giving us roughly the time when the real Etruscan civilization began.

It has been, and still is, a common mistake to speak of the Etruscans as though they were closely confined to that part of Italy called Etruria on the maps, but it is quite certain that in the early stages of their development they were differentiated from the Umbrians on the north-east and the Latins on the south in ways due rather to the locality than to race or essential character. To primitive peoples open seas or deserts are a greater hindrance to intercourse than mountains or rivers, and even these did not cut off Etruria from the neighbouring regions of Italy. The Apennines that separated her from Umbria were not difficult to cross, and the Tiber which formed the boundary was crossed with ease at many points.

1 For Barnabei's excavations see Fausto Benedetti, Gli Scavi di Nardone e il Museo di Villa Giulia (1900).
2 For a further discussion see ad fin., section Language. See also Paulus, Alltässische Forschungen, vol. i.; also sect. Language (below).
3 Cf. the contents of the graves found by Boni in the Roman Forum (Notizie degli Scavi, 1902, 1903, 1905) with the objects represented in the plates of Montellus, La Civilisation primitive en Italie, pl. 13. For the cemeteries at Novilara cf. Brizio, Monumenti antichi, vol. v.
ETRURIA and such the laws. The people were a warrior stock with little
commercial skill. Much of their wealth was due to trade, but they
were not the restless, conquering blood that goes in search
of new markets. They waited for the buyers to come to them.
That their wealth and consequent power were gathered contem-
poraneously with that of Greece is shown by various facts.
One of these is that Dionysius of Phocaea settled in Sicily after
the Ionian revolt (in which his native city took part) had been
quelled by Darius, and thence harried the Etruscans (Herod.
vi. 17). Their power is also shown by the fact that they made
an alliance with the Carthaginians, with the result that they
obtained control of Corsica (Herod. i. 166), and this union con-
tinued for many generations. That this treaty was no excep-
tional one is shown by Aristotle (Pol. iii. 96, Op. ii. 261),
who says that there were numerous treaties, concerning their alliances
and mutual rights, between the two peoples. That the Greeks
held the Etruscans in considerable dread is suggested by the
fact that Hesiod (Theog. 1011 foll.) names one of their leaders
Agrios, "the Wild Man," and by the fear they had of the straits
of Messina, where they imagined Scylla and Charybdis, which,
unless the whirlpools were of very different character than they,
were as likely to be the pirate bands of Carthaginians and
Etruscans who guarded the channel. And this explanation
is strengthened by Euporides (Med. 1342, 1359), whose Modea
compares herself to "Scylla, who dwells on the Tyrrhenian
shore." The wealth that was the source of this power of the
Etruscans must in the main have been drawn from agriculture
and forestry. The rich land with its many streams could scarcely
be surpassed for the raising of crops and cattle, and the
hills were heavily timbered. That it was such material as this,
which leaves no trace with the passing of time, that they sold
cannot be doubted, for there is plenty of evidence that their
country was visited by foreign traders of many lands, and that
they bought largely of them, especially of metals. Metals also
suggest that another source of their wealth was that of the
middleman. Their towns were the centres of exchange, where
the north and west met the south and east. They had no mines
of gold or tin, but the carriers of tin, iron or amber from the
northern side of the Mediterranean, the Phoenician and Greek
merchants bringing gold and ivory and the other luxuries of
the East. The quantities of gold, silver and bronze found in
Etruscan tombs prove that every one of them was found in workings
in unworked form, in what are practically pigs, is bronze.
This in the form of aes rude has frequently been found in
considerable quantities, and the larger and better formed bits
of metals known as "aes signatum" are not rare. Both forms
are usually spoken as of the earliest forms of money, but as
the aes rude generally bears no marks of valuation or of any mint,
and as the aes signatum is far too large and heavy for ordinary
circulation, it is probable that these shapes of metal are not to
be considered strictly or alone as coins, but as forms given to
the alloy of tin and copper made and sold by the Etruscans to
the foreigners for purposes of manufacture. This of course does
not exclude their use as money. Where the copper for this bronze
came from is not certain, but probably a great part was from
the mines of Volterra. Still another proof that what the Etruscans
sold was the product of their fields or crude metals imported
from the north, is the fact that though in the museum at Carthage
and elsewhere there are a few vases and other objects which
probably come from Etruria, still such objects are extremely
rare. On the other hand, the amber especially imported from
the East are by no means uncommon in Etruria. Such are the
ostriph shells from Volci, the Phoenician cups from

Natural Resources and Commerce.—Such was the country

855

between her and Latium has been a far greater element of
separation in the minds of modern authors than it ever was in
reality. Narrow, not particularly swift, often shallow, such a
stream can never have caused more than a moment's delay to
the hardy Etruscans. When Rome was founded, the river of
course could be used like a moat round a castle as a means of
defence, but that is very different from its being a permanent
bar to the spread of a given culture. The fact that the alphabets
used in other parts of Italy besides Etruria are derived from the
Etruscan or from similar Greek sources, that Rome was ruled
by Etruscan kings, that the temple of Jupiter on the Capitoline
was decorated by Etruscan artists (Liv. x. 23; Pliny, H.N.
xxxv. 157), that the decorations of the temple found by Signor
Mazzoleni near Conca (Notizie degli scavi, 1896) are of the same
kind as others found in Etruria, show that the influences which
grew to their closest development in the region west of the Tibre
had a marked effect over a broader region than is usually
admitted. This too was the belief of the Greek historians, many
of whom considered Rome as a Tyrrhenian city.
Cities and Organisation.—The chief cities of Etruria proper
were Arretium, Veii, Volsci, Volaterrae (Volterra), Rusellae,
and others. The country was thickly settled is made plain by
the ruins that have been found. It was governed by kings who were
elected for life, but whose powers depended largely on the
leaders (lucumones) of the separate states or regions and on the
aristocracy (Censorinus, De die natali, iv. 13). Later the office of king was abolished and
replaced by annual magistrates (Liv. v. 1). Below the aristocracy came the free people, who were divided into curiae (Serv. ad Aen.
xx. 202), and then the slaves. There can be little doubt that the early
organization of the people at Rome was typical of Etruria
(Niebuhr, Röm. Gesch. 2nd ed. i. 386).
A league of twelve cities is mentioned by the ancients (Livy
iv. 23), whose delegates met at the temple of Volturnum, but we are
not told which cities formed the league, and there can be
little doubt that the list changed from time to time. A glance
at the map makes clear some of the general relations of these
cities to one another and to the outer world. They are well
spread all over the country, and by no means one along the coast.
None of the important ones is among the mountains.
This means that the earliest inhabitants of the country were not
roving traders like the Mycenaean Greeks, and that the cities
drew their wealth and strength from agricultural pursuits, for
which the country was well suited, as the three rivers, Arno,
Umbrus and Tiber, with their feeders (not to mention several lesser streams), channel it in all directions. We get a hint to the
government of the cities from that fact that many of the
Roman forms and apanages of office were derived from the
Etruscans (Dion. Hal. iii. 61); for instance, the diadem worn
by those honoured with a triumph, the ivory sceptre and the
embroidered toga (Tertull. De Cor. 13), and so too the golden bulla
and the praetexta (Festus, s.v. "Sardi"). Such things give us an
idea as to the aristocratic basis of the government. Of the
actual laws we know something also.
Cicero (Div. ii. 23) tells the story of the miraculous uncovering by a
ploughboy of a child who had the wisdom of a sage, and how the child's words
were written down by the amazed folk, and became the
source of their law. Coming down to historic times we find
the "libri depositae Etrusci," consisted of various parts (Festus, s.v. "Ritualis"). There
were the libri haruspici (Cic. Div. i. 33, 72), which dealt
with the interpretation of the will of the gods by means of
sacrifice; the libri fulgurales, which explained the
messages of the gods in the thunder and lightning; and finally
the libri rituales, which held the rules for the conduct of daily
life—how to found cities, where to place the gates, how to take
the census, and the general ordering of the people both in peace
and war.

1 For the wars of the Greeks against the Carthaginians and the
Etruscans see Busolt, Griechische Geschichte, ii. 218 ff.
2 See (H.N. xxxv. 157). The amber was brought by the Germans
down the valley of the Po. Thence the trade-route crossed the Apennines to Pisa (Scylax in Geographia minores, ed.
Didot, i. p. 25). In the consideration of problems suggested by
amber it is too often forgotten that a very beautiful dark amber is
found in Sicily.
3 Montelius, Civilisation primitive in Italie, ii. p. 265; cf. Petrie,
Naukratis, i. p. 20, fig. 15, and Perrot-Chipiez, Histoire de l'art, iii.
Palestrina, the Egyptian glazed vases and scarabs found on more than one site. All this goes to show that the Etruscans lacked in their earlier days skilful workers in the arts and crafts.

Habits and Customs.—The lack of literary remains of the Etruscans does not cramp our knowledge of their habits as much as might be supposed, owing to the numerous paintings that are left. These paintings are on the walls of the tombs at Veii, Corneto, Chiusi (Clusium), and elsewhere, and give a varied picture of the dress, utensils and habits of the people. The evidence of many ancient authors cannot be questioned that as a race the Etruscans in historic times were much given to luxurious living. So much so in fact that Virgil (Georg. ii. 193) speaks of the *pinguis Tyrrenus* (a trumpeter at the altar) and Catullus (xxxix. 11) of the *obesus Etruscus*. Diodorus (v. 40) gives a succinct account in which he says that "their country was so fertile they derived therefrom not only sufficient for their needs but enough to supply them with luxuries. Twice a day they partook of elaborate repasts at which the tables were decked with embroidered cloths and vessels of gold and silver. The servants were numerous and noticeable for the richness of their attire. The houses, too, were filled with valuable and costly furniture. In fact, giving themselves up to sensuous enjoyments they had naturally lost the glorious reputation their ancestors had won in war." This last remark shows that Diodorus recognized the important difference between the early Etruscans who built up the country and the later ones who merely enjoyed it. Naturally courtesans flourished in such a community. Timaeus and Theopompus tell how the women lived and ate and even exercised with the men ( Athen. xii. 14; cf. i. 38), habits which of course gave the Roman satirists many openings for attack (Plaut. Cist. ii. 3. 363; cf. Herod. i. 98; Strabo xi. 14). In dress they differed but little from the Romans, both wearing the toga and the tunic. Hats too, often of pointed form, were common (Serv. ad Aen. ii. 683), as the paintings show, but it was their shoes for which they were particularly famous. One author (Lydus, de Magistr. i. 17. 36) suggests that Romulus borrowed from Etruria the type of shoe he gave the senators, and this may well be true, though the form mentioned, the *kampagus*, is of later origin. At any rate σαθηδα Τυρρηνικα are frequently mentioned. From the pictures and remains we know that the Etruscan women were fond of tights and headdresses, and that the uppers were of leather and bound with thongs.

Their occupations of trade and agriculture have been already mentioned. For their leisure hours they had athletic games including gladiatorial shows ( Athen. iv. 153; cf. Livy ix. 40. 7; Strabo v. 250.), hunting, music and dancing. All these are shown in the tomb pictures, and all, with the exception of the hunting, developed first as a part of religious service, and their importance is shown by the strictness of the rules that governed them (Cicero, De harusp. resp. ii. 23). Did a dancer lose step, or an attendant lift his hand from the chariot, the games lost their value as a religious service. An idea of the splendour of the triumphs that accompanied victorious generals and of the parades at the games is given by Appian (De reb. Punici. viii. 66) and Dionysius (vii. 92). The music that was an accompaniment of all their occupations, even of hunting (Aelian, De natur. anim. xii. 46), was mainly produced by the single or double flute, the mastery of which by the Etruscans was known to all the world. They also had small harps and trumpets.

For the legalization of all these duties and pleasures there was a calendar and time-division for the day. It is noteworthy that the beginning of the day was for them the moment when the sun was at the zenith (Serv. ad Aen. v. 738). In this they differed from the Greeks, who began their day with the sunset, and the Romans, who reckoned theirs from midnight. The weeks were of eight days, the first being market day and the sunset, and the people could appeal to the king, and the months were lunar.

The years were kept numbered by the annual driving of a nail into the walls of the temple of Nortia at Volstini (Livy vii. 3. 7), a custom later adopted by the Romans, who used the Capitoline temple for the same purpose. In Rome this rite was performed at the Ides of September, and it is likely that it took place in Etruria on the same date, the natural end of the year among an agricultural folk. A still longer measure of time was the *saeculum*, which was supposed to be the length of the longest life of all those born in the year in which the preceding oldest inhabitant died (Censorinus, De die natalis, 17. 5; cf. Zosimus ii. 1). According to later writers the Etruscan race was to last ten *saecula*, and the emperor Augustus in his memoirs (Serv. ad Bucol. iv. 47) says that the comet of the year 44 B.C. was said by the priests to betoken the beginning of the tenth *saeculum*. The earliest *saecula* had been, according to Varro, 100 years long. The later ones varied in length from 105 to 123 years. The round number 100 is obviously an ex post facto approximation, and the accuracy of the others is probably more apparent than real, but if we reckon back some 900 years from the date given by Augustus we arrive at just about the time when the archaeological evidence leaves us to believe that the Etruscans in Italy were beginning to recognize the religious development.

Religion.—To retrace the religious development of the Etruscans from its mystic beginnings is beyond our power, and it is unlikely that any future discoveries will help us much. We are, however, able to draw a clear, if not a detailed, picture of the worship paid to the various divinities, partly from the direct information we have concerning them and partly from the analogies which may safely be drawn between them and the Romans.

The frequency of sacrifice among them and their belief in the short duration of the race show clearly their belief in a good and a bad principle, and the latter seems to have been predominant in their minds. Storms, earthquakes, the birth of deformities, all gave evidence of evil powers, which could be appeased sometimes only by human sacrifice. We miss here the Greek joy in human life and the beauties of earth. The gods (aesar) were divided into two main groups, the Dii Consentes and a vaguer set of powers, the Dii Involuti (Seneca, Quaest. Nat. ii. 41), to whom even Jupiter bowed. They all dwell in various parts of the heavens (Martianus Capella, De nupt. Phil. i. 41 ff.). Of the Dii Consentes the most important were:

1. Cons. *Tynthia*, Juno (Uni) and Minerva (Menrva).

In some towns, such as Veii and Falerni, Juno was the chief deity, and at Perusa she was worshipped like the Greek Aphrodite in conjunction with Vulcan (the Greek Hephæastus). This shows that though in exterior form the Etruscan gods were influenced by the Greeks, still their character and powers betoken different beliefs. An interesting point to note about Minerva (Menrva) is that she was the goddess of the music of flutes and horns.

The myth of Athena and Marsyas probably originated in Asia Minor, and a Pelasgian Tyrrenian founded in Argos the temple of Athena Salpinx (Paus. ii. 21. 3). The evident connexion between Asia Minor and Etruria in these facts cannot be overlooked. Besides these deities there were Venus (Turan), Bacchus (Bacchos), Mercury (Tumur), Vulcan (Sateles). Of these, Sethlans is in a way the most important, for he shows a connexion in prehistoric times between Etruria and the East. Other deities of Greek origin there were—Ares, Apollo, Heracles, the Dioscuri; and, in fact, as the centuries passed, the Greek divinities were adopted almost without exception. Besides these there were also many gods of Latin or Sabine origin, of whom little is known but their names; these may often be local appellations for the same god. Among these were Volumnia at Volstini and Vertumnus at Rome, Janus, Nortia, goddess of Fortuna, Feronia, whose temple was at a town of the same name at the foot of Soraceti, Mantus, Pales, Vejovis, Elethiayia and Ceres.

Censorinus, De Dii Nat. 17.

See Paullus, Röm. Myth., s.v. "Volcanus." Opposed to this see Wissowa, Religion u. Kultus der Römer, who seems to misinterpret the evidence.

Strabo v. 2. 39; cf. Livy i. 10; Dion. Hal. ii. 32.
ETRURIA

Such were the leading gods; in addition there was the world of spirits whom we know in Rome as the Manes, Latres and Penates. The latter were of four classes, pertaining to Jove, Neptune, the gods of the lower world, and to men. The Latres too were of various sorts (familiares, compitales, viales), and with them the souls of the dead, after the performance of due expiatory rites, took their place as dis animales (Serv. ad Aen. iii. 168 and 302). The Manes are the vaguest group of all and were confined almost wholly to the lower world (Festus, s.v. "Mundus"); Apuleius, De deo Socratis). Over all these ruled Mantus and Mania, the counterparts of Pluto and Persephone in Greece. As a result of this complete hierarchy of divine powers the priesthood of Etruria was large, powerful, and of such fame that Etruscan haruspices were sent for from distant places to interpret the sacrifices and the oracles (Livy v. i. 6, xxvii. 37. 6).

Art. — The evidence drawn from tradition and custom which we have so far considered in relation to the origin and beliefs of the Etruscans has taken us into the prehistoric times much earlier than those when the handicrafts developed into true fine arts. The contents of the earliest graves show but few traces of any feeling for art either in architecture or in the lesser forms of household and personal decoration. Gradually, however, as one comes down towards the more fixed historic periods, certain objects, obviously imported from the eastern Mediterranean, occur, and these are the first signs of an interest in the beauty or curiosity of things, an interest that local workmen could not yet satisfy, but which stirred them to endeavour. It was probably during the 9th century that this began, not long after the period when foreign trade began to flourish.

The history of Etruscan art has usually been wrongly estimated as owing to the widespread delusion that objects found in Etruria were in the true sense products of native artists and indicative of native-born culture. It is only recently, and not even yet completely, that the term "Etruscan" has been given up as the name for the terra-cotta vases (which were found in the 10th century by the earlier archaeologists of the modern scientific school in great quantities in the Etruscan tombs); these are now known to have been made in Greek potters. There are few books on the subject of Etruscan art. The best known is Jules Martha's L'Ari artisque (2nd ed., 1860), a book which, though full of accurate data, shows absolute lack of discrimination between those works that are of Etruscan fabric, and those that were brought from foreign lands, particularly Greece and the Greek colonies of Magna Graecia and Sicily. These latter are too generally forgotten in the study both of Greek and of Etruscan art, and all works which show the Greek spirit are vaguely supposed to have been produced on the Greek mainland. As much of the following must be to some extent controversial in character, a concrete illustration may serve to prevent misconception as to this important distinction. The beautiful throne in the Ludovisi collection representing the birth of Aphrodite is commonly spoken of as though made by some sculptor in Greece. It seems at least as likely that it comes from Sicily. Not only is the character of the modelling similar to what we find on Sicilian sculptures and coins, and not quite so sharp as on most works from Greece, but there is a lyrical feeling for nature in the pose of the figures and in the pebbled soil on which the main group stands, which seems to answer to the Sicilian feeling as we know it in poetry rather than to the Greek.

The houses of the earliest times were, to judge by the burial urns known from their shape as hut-urns, small single room constructions of rectangular plan similar to certain types of the capanna used by the shepherds to-day. Probably the walls were wattled and the roofs were certainly thatched, for the urns show plainly the long beams fastened together at the top and hanging from the ridge down each side. Tombs cut in the rock offer other and later models of house construction, but give no suggestion that the Etruscans had any artistic sense in architecture. Such tombs are mostly later than the 4th century B.C., and show the most simple form of wood construction. Posts or columns hold up the walls and the sloping roofs, the latter made of beams with boards laid lengthwise, covered by others from ridge to eave, the intervening space forming a coffers, sometimes decorated. Though the walls of such tombs are often covered with paintings, the relation of the various parts (and, let it be remembered, these tombs represent the houses of the living) shows but the coarsest sense of proportion. The elements of the decoration, such as capitals, mouldings, rosettes, patterns, are borrowed from Greece, Egypt, or elsewhere, and are used redundantly and with no refinement.

The temples did not differ from those in Greece in any essential principal of construction except that they were generally square, from the desire to make them answer to the templum or quadrilateral division of the heavens elaborated by the priests. In Roman times the Etruscan style was the term used for colonnades with wide intercolumniations, and this shows how the early builders used wood with its possibility of long architrave beams rather than stone as in Greece. The interior arrangements of the temple also varied from the Greek models, for owing to the fact that the gods Etruria were often worshipped in groups of three the temple was divided into three chambers. The decoration —metopes, friezes, acroteria, &c.— was of terra-cotta fastened by nails to the wooden walls.

Though we know that the Etruscans were famous for their games, still there are no remains of circi, and so too, though the satyrists were well known, no theatres are left. They were obviously a race of no literary taste or culture. The theatre at Fiesole which is often referred to as Etruscan unquestionably dates from Roman times.

Underground tombs have already been mentioned in their relation to house-architecture, but there are the tumuli such as that called la Cucumella at Volci, that of the Curiaii at Alban, or that of Porsona at Clusium, which Pliny describes as one of the wonders of Italy (H.N. xxxvi. 10). These great walled-in mounds with their complex of interior chambers are interesting as reminiscent of tombs in Lydia, but architecturally they are barbaric and show no developed skill.

There remains one monument which has always been supposed to show a real advance made by the Etruscans in the art of architecture, the so-called Temple of Diana in Rome. This round-arched drain was supposed to have been built by Etruscans, and it was only in 1903 that Commendatore Boni in excavating the Forum proved that the drain was originally uncovered, and that the arch was built at the end of the Republic. Thus the honour, not of discovering the arch, for it was known to the East, but of popularizing its use, does not belong to the Etruscans, though they did use it at a comparatively late time for city gates, as at Volterra. The false arch and dome of the Mycenaean seems to have been familiar to them, though there are but few cases of its use on a large scale. The best-known instances are the Tullium or Mamertine prison in Rome, the Regolini-Galassi tomb at Cervetri, one at Sesto Fiorentino near Florence, at Cortona, at Chiusi, and also those in Latium.

Although there was, therefore, but little development in the greater arts of literature and architecture among the Etruscans, it is evident enough that there was much desire to possess the products of the lesser arts, such as sculpture, jewelry and household ornaments. But here too the study has been made difficult by the failure to distinguish between native and imported products. Before studying the objects themselves it is well to recall the legendary character of Etruscan chronology as having been described by Metelius, C. Viv. primi. ii. 172.

For an illustration of the Corneto tomb see ARCHITECTURE, vol. ii. p. 559.

recounted in *rascola*. Helbig showed that we cannot consider any of the traditional dates as being accurate until about 644 B.C., the date that is, of the fifth *xaeulum*. This is probably about one hundred years after the introduction of the Chalcidian (Ionic) alphabet into the country. One of the earliest examples of the use of it is on a vase found in the Regolini-Galassi tomb.

In considering the trade of the country it has been pointed out that its chief political connexions were with Carthage, but the artistic sense of Carthaginians or other Phoenicians was not more developed than that of the Etruscans. They were traders, and doubtless brought the Etruscans some of the Egyptian and Eastern objects which have been found in their tombs, articles that date from the 7th and 6th centuries B.C. But beside the Phoenicians the Ionian Greeks from the 9th century had been trading and colonizing in Sicily and Italy. Herodotus (i. 163) tells how the Phoenicians were the first of the Greeks to take long voyages, and that they discovered the Adriatic and Tyrrhenian seas and Iberia. Thucydides (vi. 3. 1) says that it was Chalcidians from Eubea who first settled in Sicily. Pliny (*Hist. Nat.* xlv. 12. 43) writes in the same sense, for he tells of Demaratus who came from Corinth and the artist Eucheir, Diopus, Eugrammus, who were Etruscan and had settled in Italy. The traditions of the coming of Ionian Greeks to Italy are completely borne out by the archaeological remains found in Ionian lands and in Etruria, and it is agreed that a great part of what has hitherto been considered Etruscan is no more Etruscan than the Moorish plates of the 15th century found in Italy are Florentine. The best works in most of the smaller arts are almost without exception Greek, the earlier Ionian, the later Attic; the remnants are made with the distinct intention of imitating Greek models, and should be considered as Greek, inasmuch as they do not show a natural, original expression of feeling on the part of the Etruscan workman. The Etruscans were dull artists in all lines. They were skillful copyists, nothing more, as is absolutely proved by the simple fact that we know of no Etruscan artist by name. If one takes the articles which are of obviously local manufacture, such as the burial urns or the ordinary bronze mirrors, or the pottery, it would be hard to find a similar quantity of work by any other race so lacking in originality of conception or high excellence of technique.

In the study of the monuments a division must be made distinguishing between the obviously Greek works, the works done with a desire to copy Greek models and the work of native artists. To separate the objects in the way suggested required a very considerable familiarity with Greek art, and though in many cases the result may be doubtful, still so much must be taken from the Etruscans that they are shown to have little more artistic feeling than the Romans. In the earlier centuries a strong eastern influence appears in the copying of sphinxes and similar eastern motives, but this soon gave way to the stronger Greek influence, as was natural, for the intercourse with the Phoenicians was spasmodic whereas that with the Greeks was constant. But even with the Greeks to kindle their imaginations, the Etruscans produced no school of art; no steady progression is traceable. In various towns there were various fashions of pottery or jewelry, but good, bad and indifferent constantly occur together in a way possible only among a people who possessed no natural artistic capacities and had no widespread standards of cultivated taste. The Ionians have been mentioned as having strongly affected the arts in Etruria, and, though in the later centuries Athens undoubtedly exported heavy consignments to Italy, the taste of the Etruscans seems generally to have preferred the rather heavy loose style of the Ionians, even when direct contact with them was lost and its place taken by direct relations with Athens and her colonies.

Pottery practised enormously by the Etruscans shows as clearly as possible their essential strength and weakness as artists. Even the black ware called bucchero is now known to have been manufactured in other lands and not to be an exclusively Etruscan style. In the earlier tombs this ware is present in greater numbers than any other, and the vases exhibit considerable dexterity of manufacture so far as form goes. But it is evident from comparisons with early Ionian vases that the better proportioned of the shapes are direct copies of the Ionian. The decoration of the *buccero* is either engraved, in which case it is almost always extremely rude, or formed by figures modelled or pressed by a mould on to the body of the vase. In these two last cases the figures are often suggestive of the farther East (Egyptian and Mesopotamia), but still more frequently they are taken from Greek originals, and the natural tendency of the Etruscan artist to be a copyist is very marked. Whence the moulds for these vases came is not known, but analogy with other classes of work makes it practically certain that some were imported and some made by the imitating workmen. There are other classes of vases which at first sight look as though they were imported from Greece, but by the nature of their clay are recognized to be Etruscan imitations of Greek originals. The imitation is often very exact, the only difference being that the vases imitated were of terra cotta, which the Greeks, in the form of the *Topia*, were the first to use.

Athen. i. 28.
ETRURIA

one technical matter the Etruscans seem to have made a discovery: it was in the use of granulated ornament, that is, ornament made by soldering on to the gold object infinitely small globules of the same metal laid in various designs and patterns, each globule soldered by itself. Though this style of ornament occurs in Egypt, Cyprus, Rhodes and Magna Graecia, nowhere is it accomplished with such extraordinary minuteness as in Etruria. That they should do this was natural. The difficulty of it seems to have pleased them, for it is commoner than the earlier filigree work made of wire soldered on to the gold base. Reference has been made to the scarab sets as ornament in the gold necklaces, and similarly we find amber used and, in the later work, precious stones and pearls.

As in Greece the Etruscans first carved their figures out of wood, but what these figures were like we can only imagine. The earliest known figures in the round are even less successful than the contemporary Greek work. An attempt at a female bust 7 is made not by casting but by riveting plates of bronze together. A half life size bust in the Tyszkievicz collection 8 made probably about 600 B.C. is cast solid. Later they learned the art of hollow-casting, but their attempts to reproduce figures in the round are generally lacking in skill. One reason for this was the lack of good marble, the quarries at Carrara not having been used till Roman times. Terra-cotta was the material most commonly used, and their skill in modelling and colouring this was great. The earlier statues of large size have perished; but there are three famous sarcophagi which show the work of Ionia Etruscan artists; 9 one is in the British Museum, one in the Louvre and one in the Villa di Papa Giulio at Rome. The elaborate detail and careful work, the types of the figures and the style of their dress all point to the same Ionic origin as that of the bronze chariots already mentioned. The type of sarcophagus illustrated by these examples became very common, and in the figures that decorate the covers can be traced the various influences that affected the whole of Etruscan art. In an example from Volci 10 the later Attic influence is strongly marked. Such work shows little power of origination, but much of the interest taken by careful workmen by copying carefully, and the tendency that such workmen almost invariably display of overloading the subject with too much ornament and detail. The small ash-urns, either of stone or terra-cotta, are in certain ways more interesting than the more elaborate sarcophagi, for on these urns the heads of the figures reclining on one elbow which form the usual decoration of the covers are often obvious attempts at portraiture. Single busts 11 show this same desire for accurate likeness of the person represented, and in this one line of art the Etruscans showed a new feeling, one that found its finest expression in the hands of the later Roman portraitors. The main difference between such portraits and the Greek ones is that the Greek artist thought of his subject as illustrating character that showed itself in ways of repose and thought—the essential, lasting individuality. The Etruscan and Roman portraitor thought, on the other hand, of his subject as illustrating character in ways of action; hence pure Etruscan and Roman portraits are much more tense in line, and the expression of the eye is not dreamy but distinctly focussed. They are different, but, as art, one is as fine as the other. The scenes on the sides of these urns are, as in the case of the gems and mirrors, very frequently taken from Greek story, and often are scenes of battle. 12 Work in relief for the friezes and the other decorations of temples was very common, and shows remarkable skill in the mere processes of modelling and baking the slabs of terra-cotta that were fastened by nails to the beams.

So far as the figures themselves are concerned, they seem to have but little meaning in connection with the building they decorate.

Satyrs and maenads, chariot-races and such scenes taken over from Greek models are perhaps the commonest. In none of the obviously native work is there any more instinctive feeling for the greater qualities of sculpture than in the gems. Little is original, almost everything dependent on earlier masters. There is no absorption of the artist by his work which produces great work, great because the beholder thinks rather of the work produced than of the artist who produces it. For this reason such figures as the bronze chimaira or the bronze Athena in the Florence museum are presumably not Etruscan but Greek.

There is no evidence that the Etruscan had easel-paintings like the Greeks, but their skill in painting is well illustrated by the pictures with which they frequently covered the inner walls of their tombs. The wall was prepared with a coating of fine white stucco on which the figures were painted with a large variety of tints. The best of them have been found at Tarquinii, Chiusi, Volci, Caere, Veii. The paintings exhibit the usual Greek influences. They show a certain ponderous realism, but as works of art they are of little value. As pictures of the life and customs of the people they are of great importance.

As works of art their coins are the worst efforts of the Etruscans. Gold, silver and bronze were used, but no examples can be dated earlier than the beginning of the 4th century B.C. The coins are struck according to four different standards of weight, due perhaps to different trade-connexions. The bronze coinage shows a distinct scale of reduction in weight due to the increasing use of the precious metals. Many examples show a design only on one side. The designs of the majority of the types are taken from Greek models, but strangely enough the die-cutters show no such skill as that of the makers of gems.

**Arms and Armour.**—In the early periods the chief weapons (besides bows and arrows which bore flint or bronze heads) were few and simple, and were of bronze. Iron ones have been found, and their rarity is doubtless partly due to their having rusted away. Spears of very various weights were common and also swords and daggers. These latter had straight two-edged blades with the handle either of the same piece or of some other material fastened on with rivets. The blades of the daggers are generally engraved with lines and zigzags. Shields were of circular and oval shape. These two were of bronze, the round ones decorated in Homeric fashion with concentric circles of ornament, the motives being geometric patterns or an animal repeated endlessly. Breastplates with overlapping shoulder-straps and belts, broader in front than behind, with decoration of the same kind as the bucchero vases, are not uncommon. Greaves and helmets completed their equipment. The former seem to have been less ornate than those the Greeks wore; the latter were of various shapes, the commonest being round caps with a knob on the top, or a deeper shape with a crest from front to back. Some are shown with side-pieces raised like wings, but these are perhaps more likely white-pieces raised on hinges. In later times they had trumpets and axes, and their arms became practically the same as the Roman, as one sees from the representations in the tombs.

(R. N.)

**Language**

1. By “Etruscan” is meant the language spoken by the people called Etrusci (more commonly Tuscii) by the Romans, Turskum nomen (i.e. Tuscean nomen) by their neighbours the Umbrians of Iguvium (q.v.), and Tupsynoi later, e.g. in Strabo’s time, Tuppsynai by the Greeks. Their own name for themselves was Rastena (or Rasteia), according to Dionysius Halic. (i. 30), but it seems now to be fairly probable that this was no more than the name of a leading house (represented later on in Pisa and elsewhere) dominant at some fairly early date in some one locality (see below). Niebuhr attempted on slender grounds (Rom. Hist. ed. 3 [Eng. trans.], i. p. 42) to distinguish between the Tuppsynai and the Tuscii in order to accept the strongly supported tradition of a Lydian origin for the “Tyrhenian” (see below), while rejecting it for the “Tuscans,” but no one has since attempted to maintain the distinction (Dittenberger, Hermes, 1906, p. 85, footnote, regards the form in Tuppsynai as a “Gracized form of a local name” equivalent to Tusci), and we now know enough of the morphology of Etruscan names to recognize Tur-s-co and Tur-s-eño as closely parallel Etrusco-Latin stems, cf. Venu-cius: Venu-senus both from Etr. Venu (Schulze, Lat. Eigennamen, p. 405) and Ras-enas: Ras-enius (ibid. p. 92); or Voluscas, Voluscan: Volusenus (where the formative suffixes in each word are Etrusco-Latin whether the root be the same or not). But the analysis of the names cannot be entirely satisfactory until the first syllable of Etrusci—in Greek writers sometimes Ἐτρουσκος, e.g. in Strabo—ed. Meineke—has been explained.

3. The extent of territory over which this language was spoken varied considerably at different epochs, but we have only a few fixed points of chronology. From two separate sources, both traditionally and probably sound (Dion. Hal. i. 26, and Phutarch, Sulla, 7; cf. Varro, quoted by Censorinus c. 17, 6), we should ascribe the first appearance of the Etruscans in Italy to the 12th century B.C. The intimate connexion in form between the names Roma, Romulus and the Etruscan gentes rumate, rumulna (Romatia, Romilla, &c.), and the fact that many of the early names in Rome (e.g. Raturnena, Capena, Tities, Luceres, Romnes) are characteristically Etruscan, justifies the conclusion that the foundation of the city, in the sense at least of its earliest fortification, was due to Etruscans (Schulze, p. 580). The most likely interpretation of Cato’s date for the Etruscan “foundation” of Capua is 558 B.C. (Conway, Italic Dialetts, pp. 99 and 83). In 524 B.C. (Dion. Hal. vii. 2) the Etruscans were defeated by Aristodemus of Cumae, and in 474 by Hiero of Syracuse in a great naval battle off Cumae. Between 445 and 425 (It. Dic. l.c. 1) they were driven out of Capua by the Samnites, but they lingered in parts of Campania (as far south as Salernum) till at least the next century, as inscriptions show (ib. pp. 94 ff., 53), as at Praeneste and Tusculum (ib. p. 310 ff.) till the 3rd century or later. In Etruria itself the oldest inscriptions (on the stele of Faesulae and Volaterrae) can hardly be later than the 6th century B.C. (C. Pauli, Allital. Forsch. ii. part 2, 24 ff.) the Romans had become dominant early in the 3rd century (C.I.L. xi. 1 passim), but the bulk of the Etruscan inscriptions show later forms than those found in the old town of Volsini destroyed by the Romans in 280 B.C. (C. Pauli, ib. i. 127). In the north of Italy we find Etruscan written in two alphabets (of Sondrio and Bozen) between 300 and 150 B.C. (ib. pp. 63 and 126). The evidence of an Etruscan linen book wrapped round a mummy (see below) suggests that there was some Etruscan colony at Alexandria in the period of the Ptolemies. At least one Etruscan suffix has passed into the Romance languages, -lar- or -larto in Etr. launthia (from launhh “familiaris,” or “libertas”), and Etr.-Lat. laluita, which became Ital.-elto, Fr.-Eng. elle.

3. Finally must be mentioned the remarkable pre-Hellenic epitaph discovered on the island of Lemnois in 1885 (Pauli, Allital. Forsch. ii. i and 2), the language of which offers remarkable resemblances to Etruscan, especially in the phrase sialvyea avis (?) “fifty years old”); cf. Etr. cealyas avis (“twenty years old’’); and the pair of endings -aei, -ale in consecutive words; cf. Etr. larbale hulignesti; the style of the sculptural figure has also parallels in the oldest type of Etruscan monuments. The alphabet of this inscription is identical (Kirchhoff, Stud. Griech. Alphab., 4th ed., p. 54) with that of the older group of Phrygian inscriptions, which mention King Midas and are therefore older than 620 B.C. With this should be combined the fact that a marked peculiarity of the South-Etruscan alphabet (7=ph, but earlier = the Greek digamma) has demonstrably arisen out of Ẹ on Phrygian soil, see Class. Rev. xi. 1868, p. 462. Despite the remarkable but not unsalvable difficulty of Kretschmer (Einleitung in d. Geschichte d. griech. Sprache, 1896, p. 240), the
weight of the evidence appears to be distinctly in favour of the Etruscan character of the language, and Pauli's view is now generally accepted by students of Etruscan; hence the inclusion of the inscription in the Corpus Insct. Etruscarum.

4. The first attempt to interpret Etruscan inscriptions was made by Phil. Buonarroti (Explic. et conjunct. ad monum. &c., Florence, 1726), who, as was almost inevitable at that epoch, tried to explain the language as a dialect of Latin. But no real study was possible before the determination of the alphabet by Lepsius (Insc. Umbr. et Oscæ, Leipzig, 1841), and his discovery that five of the Tables of Iguvium (q.v.), though written in Etruscan alphabet, contained a language akin to Latin but totally different from Etruscan, though some of the non-Italic peculiarities of Etruscan had been already pointed out by Ottfried Müller (Die Etrusker, Breslau, 1838). The earliest inscriptions, e.g. the terra-cotta stele of Capua of the 5th century B.C., are written in "serpentine bouroeshedon," but in its common form of the 3rd century B.C. the alphabet is retrograde, and has the following nineteen letters:

\[
\begin{align*}
\text{A} & \text{C} \text{E} \text{I} \text{O} \text{S} \text{T} \text{V} \\
\text{B} & \text{D} \text{F} \text{G} \text{H} \text{L} \text{M} \text{P} \text{R} \text{U} \text{x} \text{y} \text{z}
\end{align*}
\]

On older monuments \( \gamma \) = \( \kappa \) occurs as an archaic form of \( \epsilon \); \( \phi \) is a, a sibilant of some kind; and \( \epsilon \) is \( \kappa \), this last mostly in foreign words. In the earlier monuments the cross-bars of \( \epsilon \) and \( \kappa \) have a more decidedly oblique inclination, and \( \kappa \) is often angular (\( \gamma \)). The mediae \( b, g, d \), though they often occur in words handed down by writers as Etruscan, are never found in the Etruscan inscriptions, though the presence of the mediae in the Umbrian and Oscean alphabets and in the abecedaria shows that they existed in the earliest form of the Etruscan alphabet, \( O \) is very rare. The form \( \Upsilon \) (earlier \( \Upsilon \)) = \( \Upsilon \) in south Etruscan and Faliscan inscriptions should also be mentioned. Its combination with \( \Pi \) shows that it had once served to denote the sound of digamma just as Latin \( F \). The varieties of the alphabet in use between the Apennines and the Alps was first examined by Mommsen (Inschriften nord-etruskischen Alphabets, 1853), and have since been discussed by Pauli (Altitalische Forschungen, 1885-1894, esp. vol. iii., Die Veneter, p. 218, where other references will be found, see also Veneti).

\( \text{C} \) is the determination of the alphabet was followed by a large number of different attempts to explain the Etruscan forms from words in some other language to which it was supposed that Etruscan might be akin; Scandinavian and Basque and Semitic have been tried among the rest. These attempts, however ingenious, have all proved fruitless; even the latest and least fanciful (Remarques sur le parenté de la langue étrusque, Copenhagen, 1899; Bulletin de l'Académie Royale des Sciences et des Lettres de Danemark, 1899, p. 373), in which features of some living dialects of the Caucasus are cautiously compared by Prof. V. Thomson (as independently by Pauli, see \( \S \)), is at the best premature, and as the numerals probably misleading. Worst of all was the effort of W. Corssen (Die Sprache der Etruskern, 1873), in whom learning and enthusiasm were combined with loose methods of both epigraphy and grammar, to revive the view of Buonarroti. The only solid achievement in the period of Corssen's influence (1860-1880) was the description of the works of art (tombs, vases, mirrors and the like) from the different centres of Etruscan population; Dennis's Cities and Cemeteries of Etruria (1st ed., 1848; 2nd, 1878) contributes something even to the study of the language, because many of the figures in the scenes sculptured or engraved bear names in Etruscan form (e.g. usis, "sun"; or "of the sun," on the temple of Placentia; sufftut, "Bacchus"; tufiaxu, a demon or fury; see Dennis, Cities, 2nd ed., frontispiece, and p. 354).

6. The reaction against Corssen's method was led first by W. Buckecke, Corssen's Die Sprache der Etruskier (1876), Altitalische Forschungen (1875-1880), and continued by Carl Pauli at first jointly with Deecke and afterwards singly with greater power (Etruskische Studien, 1893), Etr. Forschungen u. Studien (Göttingen-Stuttgart, 1881-1884), Altitalische Studien (Hanover, 1883-1887); Altitalische Forschungen (Leipzig, 1883-1894). Of the work achieved during the last generation by him and the few but distinguished scholars associated with him (Danielsson, Schaefer, Skutsch and Torp) it may perhaps be said that, though the positive knowledge yet reaped is scanty, so much has been done in other ways that the prospect is full of promise. In the first place, the only sound method of dealing with an unknown language, that of interpreting the records of the language by their own internal evidence in the first instance (not by the use of imaginary parallels in better known languages whose kinship with the problematic language is merely assumed), has been finally established and is now followed even by scholars like Ella Lattes, who still retain some affection for the older point of view. By this means enough certainty has been obtained on many characteristic features of the language to bring about a general recognition of the fact that Etruscan, if we put aside its borrowings from the neighbouring dialects of Italy, is in no sense an Indo-European language. In the second place, the great number of finds—of terra-cotta from S. Maria di Capua already cited, published by Buecheler in Rhein. Museum, iv., 1900, p. i—and now in the Royal Museum at Berlin, is the longest Etruscan inscription yet found. Its best preserved part contains some two hundred words of continuous text, and is divided into paragraphs, of which the third may be cited in the reading approved by Danielsson, Torp, and the first two by words adopted by Torp (in his Bemerkungen zur etrus. Inschr. von S. Maria di Capua, Christiania, 1905), to which the student may be referred. "Ivi xeve tuluve, an priar larunu ilucux, nun: titualia xues xao(c)e anulis mulu rizile, ziz riz pulian acasi, ti-m an tule, lefam sul; iluc-per pri an ti, ar vsu; ta aiu, numberi."

7. From the recurrence of a number of particular formulae with the right numerals at intervals, the book seems to be a legal, not an official document. Torp has pointed out that the two documents have some forty words in common, and, with Latines ("Primi Apparente sulla grande iscriz. Etrusca, &c., in Rend. d. Reale Inst. Lomb., 1847, p. 84; xvi. 1849, p. 270; xxv. 1851, p. 270; xxvii. 1853, p. 270; xxviii. 1855, p. 270), "Nepitani statui", or "status pares"; Torp has made it very probable that the words "vul" (vul) and nun, which recur at regular intervals in both, mean "address," etc. Torp, and the like, preceding or following spoken parts of the original.

Along with the growth of the material, some positive increase in knowledge of the language has been attained. Independently of the work done upon particular inscriptions, such as that which has just been described, a considerable study of Etruscan proper names already mentioned by Prof. W. Schule of Berlin (Zur Geschichte lateinischer Eigennamen, Berlin, 1904), which has incidentally embodied and somewhat extended the points of Etruscan nomenclature previously recorded. The chief results for our purpose may be briefly stated. It will be convenient to use the following terms:

1) praenomen = personal name of the individual.

2) nomen = family name.

3) Voc = Voc. or Lucr. of a man, Luctr. or Luctr. of a woman.
and sometimes as marriage; endings to (es, als) 3, 6, dedications distinguish (3) five which somehow represented (mi) an important office, and with its supplement was long recognized as a service of the Gauls (beginning about 400 B.C.).

All the examples given illustrate the few principles of inflexion and word-formation that are reasonably certain, for example, the various ‘genital’ endings. Those in -s and -l are also found in deverbal adjectives (e.g. berus, “terror”), and the -alx ending is used also in Latin. Furthermore, the suffix -nus, -na, and the -azione ending, which is used in Latin, has a translative meaning of the Gauls.

The examples show that the Latin cognomen is not always used directly after a proper name, but sometimes it is used as a separate word. For example, the Latin name of a man, “Hannossa” (praenomen = praenomen), was used as a separate word, and the Latin name of a woman, “Hannossa” (praenomen = praenomen), was used in the same way. As an example of a cognomen used in this way, the Latin name of a man, “Hannossa” (praenomen = praenomen), was used in the same way.

It's industries include the manufacture of tobacco, soap and leather, and there is a considerable trade in wine and agricultural products. Founded in the 8th century by Eddo, bishop of Strassburg, Ettenheim remained attached to that see until 1802, when it passed to Baden. Louis Antoine Henri de Bourbon-Condé, duke of Enghien (1772-1804), who had taken refuge here in 1801, was arrested in Ettenheim on the 15th of March 1804 and conveyed to Paris, where he was shot on the 20th of March following. The Benedictine abbey of Ettenheimmünster, which was founded in the 8th century and which was dissolved in 1803, occupied a site south of the town.

ETTINGSHAUSEN, CONSTANTIN, BARON VON (1826-1897), Austrian geologist and botanist, was born in Vienna on the 16th of June 1826. He graduated as a doctor of medicine in Vienna, and became in 1854 professor of botany and natural history at the medical and surgical medical academy in that city. In 1871 he was chosen professor of botany at Graz, a position which he occupied until the close of his life. He was distinguished for his researches on the tertiary floras of various parts of Europe, and on the fossil floras of Australia and New Zealand. He died at Graz on the 1st of February 1897.

PUBLICATIONS.—Die Fornkämmer der Jetztzeit zur Untersuchung und Bestimmung der in den Formationen der Erdkrone eingeschlossenen Überreste von vorweltlichen Arten dieser Ordnung nach dem Flächen-Skelet bearbeitet (1865); Physiographie der Medicinal-Pflanzen (1862); A Monograph of the British Eocene Flora (with J. Starkie Gardner). Palaeontograph. Soc. vol. i. (Filices, 1870-1882).

ETTLINGEN, a town of Germany, in the grand-duchy of Baden, on the Alb, and the railway Mannheim-Basel, 44 m. S. of Karlsruhe. Pop. (1905) 8040. It is still surrounded by old walls and ditches, and presents a medieval and picturesque appearance. Among its more striking edifices are an old princely residence, with extensive grounds, an Evangelical and two Roman Catholic churches, and the buildings of a former monastery. There are also many Roman remains, notable among them the “Neptune” sculpture, now embedded in the wall of the town-hall. Its chief manufactures are paper-making, spinning, weaving and machine building. The cultivation of wine and fruit is also largely carried on, and in these products considerable trade is done.

The first notice of Ettingen dates from the 8th century. It became a town in 1227 and was presented by the emperor Frederick II. to the margrave of Baden. In 1689 it was pillaged by the French, and near the town Moreau defeated the archduke Charles on the 9th and 10th of July 1796. See Schwarz, Geschichte der Stadt Ettlingen (Karlsruhe, 1900).

ETTMÜLLER, ERNST MORITZ LUDWIG (1802-1877), German philologist, was born at Gersdorf near Löbau, in Saxony, on the 5th of October 1802. He was privately educated by his father, the Protestant pastor of the village, entered the gymnasium at Zittau in 1816 and studied from 1823 to 1826 at the university of Leipzig. After a period of about two years during which he was partly abroad and partly at Gersdorf, he proceeded to Jena, where he graduated in 1828. He then entered the university, a course of lectures on the old Norse poets. Three years later he was called to occupy the mastership of German language and literature at the Zürich gymnasium; and in 1863 he left the gymnasium for the university, with which he had been partially connected twenty years before. He died at Zürich in April 1877. To the study of English Ettmüller contributed by an alliterative translation of Beowulf (1840), an Anglo-Saxon chrestomathy entitled Engla and Seaxna scopas and boceras (1850), and a well-known Lexicon Anglo-Saxonicum (1851), in which the explanations and comments are given in Latin, but the words unfortunately are arranged according to their etymological affinity, and the letters according to phonetic relations. He edited a large number of High and Low German texts, and to the study of the Scandinavian literatures he contributed an edition of the Völsunga (1831), a translation of the Lieder der Edda von den Nibelungen (1837) and an old Norse reading book and vocabulary. He was also the author of a Handbuch der deutschen Literaturgeschichte (1847), which includes the treatment of the Anglo-Saxon, the Old Scandinavian, and the Low German branches; and he popularized a great deal of literary information in his Herbstabende und Winternächte: Gespräche über Dichtungen und Dichter (1865-1867). The alliterative version which he admired in the old German poems he himself employed in his Deutsche Stammkönige (1844) and Das verprüglichte Zahnwerk, oder Karl der Grosse und die Heilige Goar (1852).

ETTMÜLLER, MICHAEL (1644-1683), German physician, was born at Leipzig on the 26th of May 1644, studied at his native place and at Wittenberg, and after travelling in Italy, France and England was recalled in 1668 to Leipzig, where he was admitted a member of the faculty of medicine in 1676. About the same time the university confirmed to him the chair of botany, and appointed him extraordinary professor of surgery and anatomy. He died on the 9th of March 1683, at Leipzig. He enjoyed a great reputation as a lecturer, and wrote many tracts on medical and chemical subjects. His collected works were published in 1708 by his son, Michael Ernst Ettmüller (1673-1732), who was successively professor of medicine (1702), and anatomy and surgery (1708), physiology (1719) and pathology (1724) at Leipzig.

ETTRICK, a river and parish of Selkirkshire, Scotland. The river rises in Capel Fell (2232 ft.), a hill in the extreme S.W. of the shire, and flows in a north-easterly direction for 32 m. to its junction with the Tweed, its principal affluent being the Yarrow. In the parish of Ettrick were born James Hogg, the “Ettrick shepherd” (the site of the cottage being marked by a monument erected in 1809), Tibbie (Elizabeth) Shiel (1782-1788), keeper of the famous inn at the head of St Mary's Loch, both of whom are buried in the churchyard, and Thomas Boston (1713-1767), one of the founders of the Relief church. About 2 m. below Ettrick church is Thirlestane Castle, the seat of Lord Napier and Ettrick, a descendant of the Napier of Merchiston, and beside it is the ruin of the stronghold that belonged to John Scott of Thirlestane, to whom, in reward for his loyalty, James V. granted a sheaf of spears as a crest, and the motto, “Ready, aye ready.” Two miles up Bankle Burn, a right-hand tributary, lies the site of Buccleuch, another stronghold of the Scotts, which gave them the titles of earl (1619) and duke (1663). Only the merest fragment remains of Tushielaw tower, occupying high ground opposite the confluence of the Rankle and the Ettrick, the home of Adam Scott, “King of the Border,” who was executed for his misdeeds in 1530. Lower down the dale is Deloraine, recalling one of the leading characters in The Lay of the Last Minstrel. If the name come from the Gaelic daín Oraín, “Oraín’s field,” the district was probably a scene of the labours of St Oraín (d. 548), an Irish saint and friend of Columba. It seems that Sir Walter Scott’s rhythm has caused the accent wrongly to be laid on the last, instead of the penultimate syllable. Carterhaugh, a corruption of Careliaugh, occupying the land where Ettrick and Yarrow meet, was the scene of the ballad of Young Tamline, and of the historic battle fought in 1215, under the auspices of the duke of Buccleuch, between the burghers of Selkirk, championed by Walter Scott, sheriff of the Forest (not yet a baronet), and the men of Yarrow vale, championed by the Ettrick shepherd.

ETTY, WILLIAM (1787-1849), British painter, was born at York, on the 10th of March 1787. His father had been in early life a miller, but had finally established himself in the city of York as a baker of spice-bread. After some scanty instruction of the most elementary kind, the future painter, at the age of eleven and a half, left the paternal roof, and was bound apprentice in the printing-office of the Hull Packet. Amid many trials and discouragements he completed his term of seven years’ servitude, and having in that period come by practice, at first surreptitious, though afterwards allowed by his master “in lawful hours,” to know his own powers, he removed to London.

The kindness of an elder brother and a wealthy uncle, William Ett, himself an artist, stood him in good stead. He commenced his training by copying without instruction from nature, models, prints, &c.—his first academy, as he himself says, being a
plaster-cast shop in Cock Lane, Smithfield. Here he made a copy from an ancient cast of Cupid and Psyche, which was shown to Opie, and led to his being enrolled in 1807 as student of the Academy, whose schools were at that time conducted in Somerset House. Among his fellow scholars at this period of his career were some who in after years rose to eminence in their art, such as Wilkie, Haydon, Collins, Constable. His uncle generously paid the necessary fee of one hundred guineas, and in the summer of 1807 he was admitted to be a private pupil of Sir Thomas Lawrence, who was at the very acme of his fame. Etty himself always looked on this privilege as one of incalculable value, and till his latest day regarded Lawrence as one of the chief ornaments of British art. For some years after he quitted Sir Thomas's studio, even as late as 1816, the influence of his preceptor was traceable in the mannerism of his works. Though he had by this time made great progress in his art, his career was still one of almost continual failure, hardly cheered by even a passing ray of success. In 1811, after repeated rejections, he at last obtained the satisfaction of seeing his "Telemachus rescuing Antiope" on the walls of the Academy. It was badly hung, however, and attracted little notice. For the next five years he persevered with quiet and consistent energy in overcoming the disadvantages of his early training with yearly growing success, and he was even beginning to think of something he was with which at 1816 he resolved to improve his knowledge of art by a journey to Italy. After an absence of three months, however, he was compelled to return home without having penetrated farther south than Florence. Struggles and vexations still continued to harass him, but he bore up against them with patient endurance and force of will. In 1820 his "Coral-finders," exhibited at the Royal Academy, attracted much attention, and its success was more than equalled by that of "Cleopatra's arrival in Cilicia," shown in the following year. In 1822 he again set out on a tour to Italy, taking Paris on his way, and astonished his fellow-students at the Louvre by a woman, with yowd, seed, while he jests at such etymological feats as the derivation of "Ophraen," heaven, as to τον δην τα λαο, from looking at things above, or ανθρωπος, man, from άνθρωπος, he who looks up at what he sees. Until the comparative study of philology and the development of the laws underlying phonetic changes, the derivation of words was a matter mostly of guess-work, sometimes right but more often wrong, based on superficial resemblances of form and the like. This popular etymology, to which the Germans have given the name Volksetymologie or folk-etymology, has had much influence in the form which words take (e.g. "crawfish" or "crayfish," from the French crevis, modern terevisse, or "sand-blind," from samblinda, i.e. semi-, half-blind), and has frequently been the occasion of homonyms. W. W. Skeat has embodied in certain canons or rules some well-known principles which should be observed in giving the etymology of a word; these may be usefully given here: (1) Before attempting an etymology, ascertain the earliest form and use of the word, and observe chronology. (2) Observe history and geography; borrowings are due to actual contact. (3) Observe phonetic laws, especially those which regulate the mutual relation of consonants in the various Aryan languages, at the same time comparing the vowel sounds. (4) In comparing two words, A and B, belonging to the same language, of which A contains the lesser number of syllables, A must be taken to be the more original word, unless we have evidence of contraction or other corruption. (5) In comparing two words, A and B, belonging to the same language and consisting of the same number of syllables, the older form can usually be distinguished by observing the sound of the principal vowel. (6) Strong verbs, in the Teutonic languages, and the so-called "irregular verbs" in Latin, are commonly to be considered as primary, other related forms being taken from them. (7) The whole of a word, and not a portion only, ought to be reasonably accounted for; and, in tracing changes of form, any infringement of phonetic laws is to be regarded with suspicion. (8) Mere resemblances of form and apparent connection in sense between languages which have different phonetic laws or no necessary connection are commonly a delusion, and
are not to be regarded. (q) When words in two different languages are more nearly alike than the ordinary phonetic laws would allow, there is a strong probability that one language has borrowed the word from the other. Truly cognate words ought not to be too much alike. (10) It is useless to offer an explanation of an English word which will not also explain all the cognate forms (Introduction to Etymological Dictionary of the English Language, (1898).

An English word is either “the extant formal representative or direct phonetic descendant of an earlier (Teutonic) word; or it has been adopted or adapted from some foreign language,” adoption being a popular, and adaptation being a literary or learned process; finally, there is formation, i.e. the “combination of existing words (foreign or native) or parts of words with each other or with living formatives, i.e. syllables which no longer exist as separate words, but yet have an appreciable significance which they impart to the new product” (see Introduction to the New English Dictionary, p. xx). A further classification of words according to their origin is that into (1) naturals, i.e. purely native words, like “mother,” “father,” “house”; (2) those which become perfectly naturalized, though of foreign origin, like “cat,” “mutton,” “mother,” (3) denizens, words naturally in language keeping the foreign spelling and inflections, e.g. “locus,” “camera”; (4) aliens, words for foreign things, institutions, offices, &c., for which there is no English equivalent, e.g. menu, table d’hôte, impériale, lakhi, mollah, tarbush; (5) casuals, e.g. bloc, Ausgleich, sabotage, differing only from “aliens” in their temporary use. The full etymology of a word should include the phonetic descent, the source of the word, whether from a native or from a foreign origin, and, if the latter, whether by adoption or adaptation, or, if a formed word, the origin of the parts which go to make it up. In the present edition of the Encyclopaedia Britannica such full etymologies, which would be necessary and in place in an etymological dictionary, have not been given in every instance, but brief etymological notes are appended, showing in outline the sources and history, and in many cases the development in meaning. (See also Dictionary.)

EU, a town of north-western France, in the department of Seine-Inferieure, on the river Brese, 64 m. N.N.E. of Rouen on the Western railway, and 2 m. E.S.E. of Le Tréport, at the mouth of the Brese, which is canalized between the two towns. Pop. (1906) 4,568. The extensive port of Louviers lies to the south-east of the town. Eu has three buildings of importance—the beautiful Gothic church of St Laurent (12th and 13th centuries) of which the exterior of the choir with its three tiers of ornamented buttressing and the double arches between the pillars of the nave are architecturally notable; the chapel of the Jesuit college (built about 1625), in which are the tombs of Henry, third duke of Guise, and his wife, Katherine of Cleves; and the château. The latter was begun by Henry of Guise in 1578, in place of an older château burnt by Louis XI. in 1475 to prevent its capture by the English. It was continued by Mademoiselle de Montpensier in the latter half of the 17th century, and restored by Louis Philippe who, in 1843 and 1845, received Queen Victoria within its walls. In 1902 the greater part of the building was destroyed by fire. The town has a tribunal of commerce and a communal college, flour-mills, manufactories of earthenware, biscuits, furniture, casks, and glass and brick works; the port has trade in grain, timber, hemp, flax, &c.

Eu (Augusta) was in existence under the Romans. The first line of its counts, supposed to be descended from the dukes of Normandy, was that of Aylx (died 1227), who married Raoul (Ralph) de Lusignan, known as the Sire d’Issouques, lordship of that name. Their grand-daughter Marie, the countship of Eu passed by marriage to the house of Brienne, two members of which, both named Raoul, were constables of France. King John confiscated the countship in 1350, and gave it to John of Artois (1352). His great-grandson, Charles, son of Philip of Artois, count of Eu, and Marie of Berry, played a conspicuous part in the Hundred Years’ War. He was taken prisoner at the Battle of Agincourt (1415), and remained in England twenty-three years, in accordance with the dying injunctions of Henry V. that he was not to be let go until his son, Henry VI., was of age to govern his dominions. He accompanied Charles VII. on his campaigns in Normandy and Guyenne, and was made lieutenant-general of these two provinces. It was he who effected a reconciliation between the king and the dauphin after the revolt of the latter. He was created a peer of France in 1458, and made governor of Paris during the war of the League of the Public Weal (1465). He died on the 15th of July 1472 at the age of about seventy-eight, leaving no children. His sister’s son, John of Burgundy, count of Nevers, now received the countship, which passed through heiresses, to the 15th century, to the house of Cleves, and to that of Lorraine-Guise. In 1600 Henry II. of Lorraine, duke of Guise, sold it to “Mademoiselle,” Anne Marie Louise d’Orléans, duchesse de Montpensier (a.s.), who made it over (1682) to the duke of Maine, bastard son of Louis XIV., as part of the price of the release of her lover Lauzun. The second son of the duke of Maine, Louis Charles de Bourbon (1701-1775), bore the title of count of Eu. In 1755 he inherited from his elder brother, Louis Auguste de Bourbon (1700-1755), prince de Dombes, greater estates, which also fell to the king. The remainder, which was still considerable, passed to his younger son, Henri de Penthievre. These estates were confiscated at the Revolutions, but at the Restoration they were bestowed by Louis XVII. on the duchess-dowager of Orleans who, in 1821, bequeathed them to her son, afterwards King Louis Philippe. They were again confiscated in 1832, but were restored to the Orleans family by the National Assembly after the Franco-German War. The title of count of Eu was revived in the 19th century in favour of the eldest son of the duke of Nemours, second son of King Louis Philippe.

EUBOEA (pronounced Ευβοια in the modern language), EURIPOS, or NGROPOUT, the largest island of the Grecian archipelago. It is separated from the mainland of Greece by the Euboic Sea. In general outline it is long and narrow; it is about 90 m. long, and varies in breadth from 30 m. to 4. Its general direction is from N.W. to S.E., and it is traversed throughout its length by a mountain range, which forms part of the chain that bounds Thessaly on the E., and is continued south of Euboea in the lofty islands of Andros, Tenos and Mykonos. The principal peaks of this range are grouped in three knots which divide the island into three portions—towards the north, opposite the Lorcan territory, the highest peaks are Gaetades (4,436 ft.) and Xeron (3,232 ft.). The former was famed in ancient times for its medicinal plants, and at its foot are the celebrated hot springs, near the town of Aedepsus (mod. Lipos), called the Baths of Heracles, used, we are told, by the dictator L. Cornelius Sulla, and still frequented by the Greeks for the cure of gout, rheumatism and digestive disorders. These springs, strongly sulphurous, rise a short distance inland at several points, and at last pour steaming over the rocks, which they have yellowed with their deposit, into the Euboic Sea. Opposite the entrance of the Malic Gulf is the promontory of Cenaeum, the highest point (2,221 ft.) behind which is now called Lithada, a corruption of Lichades, the ancient name of the islands off the extremity of the headland. Here again we meet with the legends of Heracles, for this cape, together with the neighbouring coast of Trachia, was the scene of the events connected with the death of that hero, as described by Sophocles in the Trachiniae. Near the north-east extremity of the island, and almost facing the entrance of the Gulf of Pagasae, is the promontory of Ariesium, celebrated for its great naval victory gained by the Greeks over the Persians, 480 B.C. Towards the centre, to the N.E. of Chalcis, rises the highest of its mountains, Dryphos or Dirpho, now Mount Delphi (5725 ft.), the bare summit of which is not entirely free from snow till the end of May, while its sides are clothed with pines and firs, and lower down with chestnuts and planes. It is one of the most conspicuous summits of eastern Greece, and from its flanks the promontory of Cheronesus projects into the Aegean. At the southern extremity the highest mountain is Ocha, now called St Elias (4,820 ft.).
The south-western promontory was named Gerasestus, the south-eastern Cape Palaeon; the latter, an exposed point, attracts the storms, which rush between it and the neighbouring cliffs of Andros as through a funnel. The whole of the eastern coast is rocky and destitute of harbours, especially the part called Coela, or "the Hollows," where part of the Persian fleet was wrecked. So greatly was this dreaded by sailors that the principal line of traffic from the north of the Aegean to Athens used to pass by Chalcis and the Euboic Sea.

Euboea was believed to have originally formed part of the mainland, and to have been separated from it by an earthquake. This is the less improbable because it lies in the neighbourhood of a line of earthquake movement, and both from Thucydides and from Strabo we hear of the northern part of the island being shaken at different periods, and the latter writer speaks of a fountain at Chalcis being dried up by a similar cause, and a mud volcano formed in the neighbouring plain. Evidences of volcanic action are also traceable in the legends connected with Hercules at Aedepou and Caneaum, which here, as at Lemnos and elsewhere in Greece, have that origin. Its northern extremity is separated from the Thessalian coast by a strait, which at one point is not more than a mile and a half in width. In the neighbourhood of Chalcis, both to the north and the south, the bays are so confined as readily to explain the story of Agamemnon's fleet having been detained there by contrary winds. At Chalcis itself, where the strait is narrowest, it is called the Eupirus, and here it is divided in the middle by a rock, on which formerly a castle stood. The channel towards Boeotia, which is now closed, is spanned by a stone bridge. The other, which is far the deeper of the two, is crossed by an iron swing-bridge, allowing for the passage of vessels. This bridge, which dates from 1856, replaced a smaller wooden swing-bridge erected in 1856.

The extraordinary changes of tide which take place in this passage have been a subject of wonder from classical times. At one moment the current runs like a river in one direction, and shortly afterwards with equal velocity in the other. Strabo speaks of seeing it flow seven times in the day, but it is more accurate to say, with Livy, that it is irregular. A bridge was first constructed here in the twenty-first year of the Peloponnesian War, when Euboea revolted from Athens; and thus the Boeotians, whose work it was, contrived to make that country "an island to every one but themselves." The Boeotians by this means secured a powerful weapon of offence against Athens, being able to impede their supplies of gold and corn from Thrace, of timber from Macedonia, and of horses from Thessaly. The name Eupirus was corrupted during the middle ages into Evripo and Egripo, and in this latter form transferred to the whole island, whence the Venetians, when they occupied the district, altered it to Negroponte, referring to the bridge which connected it with the mainland.

The rivers of Euboea are few in number and scanty in volume. In the north-eastern portion the Budros flows into the Aegean, being formed by two streams which unit near their mouth in a plain, and we perhaps the Cereus and Neleus concerning which the story was told that shep drinking the water of the one became white, of the other black. On the north coast, near Histiae, is the Callas; and on the western side the Lelantus, near Chalcis, flowing through the plain of the same name. This plain, which intervenes between Chalcis and Eretria, and was a fruitful source of contention to those cities, is the most considerable of the few and small spaces of level ground in the island, and was fertile in corn. Aristotle, when speaking of the aristocratic character of the horse, as requiring fertile soil for its support, and consequently being associated with wealth, instances its use among the Chalcidians and Eretrians, and in the former of those two states we find a class of nobles called Hippobouleis. This rich district was afterwards occupied by Athenian cieruchs.

The next largest plain was that of Histiae, and at the present day this and the neighbourhood of the Budros (Ahmet-Aga) are the two best cultivated parts of Euboea, owing to the exertions of foreign colonists. The mountains afford excellent pastureage for sheep and cattle, which were reared in great quantities in ancient times, and seem to have given the island its name; these pastures belonged to the states. The forests are extensive and fine, and are now superintended by government officials, called ἅραρθεῖς, in spite or with the connivance of whom the timber is being rapidly destroyed—partly from the merciless way in which it is cut by the proprietors, partly from its being burnt by the shepherds, for the sake of the rich grass that springs up after such conflagrations, and partly owing to the goats, whose bite kills all the young growths. In the mountains were several valuable mines of iron and copper; and from Karystos, at the south of the island, came the green and white marble, the modern Cipollino, which was in great request among the Romans of the imperial period for architectural purposes, and the quarries of which belonged to the emperor. The scenery of Euboea is perhaps the most beautiful in Greece, owing to the varied combinations of rock, wood and water; for from the uplands the sea is almost always in view, either the wide island-studded expanse of the Aegean, or the succession of lakes formed by the Euboic Sea, together with mountains of exquisite outline, while the valleys and maritime plains are clothed either with fruit trees or with plane trees of magnificent growth.

On the other hand, no part of Greece is so destitute of interesting remains of antiquity as Euboea. The only site which has attracted archaeologists is that of Eretria (p. 866), which was excavated by the American School of Athens in 1890–1895.

Like most of the Greek islands, Euboea was originally known under other names, such as Macris and Dolche from its shape, and Ellopia and Abantis from the tribes inhabiting it. The races by which it was occupied at an early period were different in the three districts, into which, as we have seen, it was naturally divided. In the northern portion we find the Histiaeoi and Ellopaei, Thessalian races, which probably had passed over from the Pagasaean Gulf. In central Euboea were the Curetes and Abantes, who seem to have come from the neighbouring continent by way of the Eupirus; of these the Abantes, after being reinfomed by Ionians from Attica, rose to great power, and exercised a sort of supremacy over the whole island, so that in Homer the inhabitants generally are called by that name. The southern part was occupied by the Dryopes, part of which tribe, after having been expelled from their original seats in the south of Thessaly by the Dorians, migrated to this island, and established themselves in the three cities of Karystos, Dysostos and Styra. The population of Euboea at the present day is made up of elements not less various, for many of the Greek inhabitants seem to have immigrated, partly from the mainland, and partly from other islands; and besides these, the southern portion is occupied by Albanians, who probably have come from Andros; and in the mountain districts are many Valet shepherds are found.

History.—The history of the island is for the most part that of its two principal cities, Chalcis and Eretria, the latter of which was situated about 15 m. S.E. of the former, and was also on the shore of the Euboic Sea. The neighbourhood of the fertile Lelantine or Lelantine plains, and their proximity to the place of the present Eretria, was the chief cause of the choice of site, as well as of their prosperity. Both cities were Ionian settlements from Attica, and their importance in early times is shown by their numerous colonies in Magna Graecia and Sicily, such as Cumae, Rhegium and Naxos, and on the coast of Macedonia, the projecting portion of which, with its three peninsulas, hence obtained the name of Chalcidice. In this way they opened new trade routes to the Greeks, and extended the field of civilization. How great their commerce was is shown by the fact that the Euboic scale of weights and measures was in use at Athens (until Solon, q.v.) and among the Ionian cities generally. They were rival cities, and at first appear to have been equally powerful; one of the earliest of the sea-fights mentioned in Greek history took place between them, and in this we are told that many of the other Greek states took part. It was in consequence of the aid which the people of Miletus lent to the Eretrians on this occasion that Eretria sent five ships to aid the Ionians in their revolt against the Persians (see Ionia); and owing to this, that city was the first place...
in Greece proper to be attacked by Datis and Artaphernes in 490 B.C. It was utterly ruined on that occasion, and its inhabitants were transported to Persia. Though it was restored after the battle of Marathon, on a site a little distance from its ancient position, and for a while it continued to exist, but it was still the second city in the island. From this time its neighbour Chalcis, which, though it suffered from a lack of good water, was, as Strabo says, the natural capital from its commanding the Euripus, held an undisputed supremacy. Already, however, this city had suffered from the growing power of Athens. In the year 506, when the Chalcidians joined with the Boeotians and the Spartan king Cleomenes in a league against that state, they were totally defeated by the Athenians, who established 4000 Attic settlers (see Cleruchy) on their lands, and seem to have reduced the whole island to a condition of dependence. Again, in 446, when Euboea endeavoured to throw off the yoke, it was once more reduced by Pericles, and a new body of settlers was planted at Histiaea in the north of the island, after the inhabitants of that town had been expelled. This event is referred to by Aristophanes in the Clouds (212), where the old farmer, on being shown Euboea on the map "lying outstretched in all its length," remarks,—"I know; we laid it prostrate under Pericles." The Athenians fully recognized its importance to them, as supplying them with corn and cattle, as securing their commerce, and as guaranteeing them against piracy, for its proximity to the coast of Attica rendered it extremely dangerous to them when in off-s Dien, so that in the De corona, speaks of a time when the pirates that made it their headquarters so infested the neighbouring sea as to prevent all navigation. But in the 21st year of the Peloponnesian war the island succeeded in regaining its independence. After this we find it taking sides with one or other of the leading states, until, after the battle of Chaeronea, it passed into the hands of Philip II. of Macedon, and finally into those of the Romans. By Philip V. of Macedon Chalcis was called one of the three feters of Greece, Demetrias on the Gulf of Pagasae and Corinth being the other two. In modern history Euboea or Negropont comes once more prominently into notice at the time of the fourth crusade. In the partition of the Eastern empire by the Latins which followed that event the island was divided into three feuds, the occupants of which were long found it expedient to place themselves under the protection of the Venetian republic, which thenceforward became the sovereign power in the country. For more than two centuries and a half during which the Venetians remained in possession, it was one of the most valuable of their dependencies, and the lion of St. Mark may still be seen, both over the sea gate of Chalcis and in other parts of the town. At length in 1470, after a valiant defence, this well-fortified city was wrested from them by Mahommed II., and the whole island fell into the hands of the Turks. One desperate attempt to regain it was made by Francesco Morosini (d. 1694) in 1688, when the city was besieged by land and sea for three months; but owing to the strength of the place, and the disease which thinned their ranks, the assailants were forced to withdraw. At the conclusion of the Greek War of Independence, in 1830, the island was delivered from the Turkish sway, and constituted a part of the newly established Greek state. Euboea at the present time produces a large amount of grain, and its land is also considerable, great quantities of magnesia and lignite being exported. In 1869 it was constituted a separate nome (pop. 1907, 116,093).

**EUBULIDES**

EUBULIDES, a native of Miletus, Greek philosopher and successor of Eudoxus as head of the Megarian school. Nothing is known of his life. Indirect evidence shows that he was a contemporary of Aristotle, whom he attacked with great bitterness. There was also a tradition that Democritus was one of his pupils. His name has been preserved chiefly by some celebrated, though false and captious, syllogisms of which he was the reputed author. Though mainly examples of verbal quibbling, they serve to show the difficulties of language and of explaining the relationship of sense-giving impressions. Eubulides wrote a discourse on Diogenes of Cnidus and also a number of comedies. (See MEGARIAN SCHOOL OF PHILOSOPHY.)

**EUBLULUS,** of Anaphylatus, Athenian demagogue during the time of Demosthenes. He was a persistent opponent of that statesman, and was chiefly instrumental in securing the acquittal of Aeschines (who had been his own clerk) when accused of treachery in connexion with the embassy to Philip of Macedon. Eubulus took little interest in military affairs, and was (at any rate at first) a strong advocate of peace at any price. He devoted himself to matters of administration, especially in the department of finance, and although he is said to have increased the revenues and to have done real service to his country, there is no doubt that he took advantage of his position to make use of the material forces of the state for his own aggrandizement. His proposal that any one who should move that the Theoric Fund should be applied to military purposes should be put to death may have gained him the goodwill of the people, but it was not in the true interest of the state. Later, Eubulus himself seems to have recognized this, and to have been desirous of modifying or repealing the regulation, but it was too late; Athens had lost all feelings of patriotism; cowardly and indolent, she rivalled other Great States in her luxury and extravagance (Theopompos in Athenaeus iv. p. 169). As one of the chief members of an embassy to Philip, Eubulus allowed himself to be won over, and henceforth did his utmost to promote the cause of the Macedonian. The indignant remonstrances of Demosthenes failed to weaken Eubulus’s hold on the popular favour, and after his death (before 330) he was distinguished with special honours, which were described by Hypereides in a speech (Περὶ τῶν Ἐυβολίου δορικῶν) now lost. Eubulus was no doubt a man of considerable talent and reputation as an orator, but none of his speeches has survived, nor is there any appreciation of them in ancient writers. Aristotle (Rhetoric, i. 15. 15) mentions a speech against Chares, and Theopompos (in his Philippica) had given an account of his life, extracts from which are preserved in Harpocration.

**EUBULUS,** Athenian poet of the Middle comedy, flourished about 370 B.C. Fragments from about fifty of the 104 plays attributed to him are preserved in Athenaeus. They show that he took little interest in political affairs, but confined himself chiefly to mythological subjects, ridiculing, when opportunity offered, the bombastic style of the tragedians, especially Eu- phyrius. His language is pure, and his versification correct.

Fragments in T. Riedel, Compendium Atticorum Fragmenta, ii. (1884).

**EUCALYPTUS,** a large genus of trees of the natural order Myrtaceae, indigenous, with a few exceptions, to Australia and Tasmania. In Australia the Eucalypti are commonly called "gum-trees" or "stringy-bark trees," from their gummy or resinous products, or fibrous bark. The genus, from the evidence of leaf-leaves, appears to have been represented by several species in Eocene times. The leaves are leathery in texture, hang obliquely or vertically, and are studded with glands which contain a fragrant volatile oil. The petals cohere to form a cap which is discarded when the flower expands. The fruit is surrounded by a woody cup-shaped receptacle and contains very numerous minute seeds. The Eucalypti are rapid in growth, and many species are of great height, E. ayssyalina, the tallest known tree, attaining to as much as 480 ft., exceeding in height the Californian big-tree (Sequoia gigantea), with a diameter of 8 ft. E. globulus, so called from the rounded form of its cap-like corolla, is the blue gum tree of Victoria and Tasmania. The leaves of trees from three to five years of age are large, sessile and of a glaucous-white colour, and grow horizontally; 1 Whence the name (εὐκαλυπτος, well-covered) given by L’Heritier, 1788.
those of older trees are enisiform, 6-12 in. long, and bluish-green in hue, and are directed downwards. The flowers are single or in clusters, and nearly sessile. This species is one of the largest trees in the world, and attains a height of 375 ft. Since 1854 it has been successfully introduced into the south of Europe, Algeria, Egypt, Tahiti, New Caledonia, Natal and India, and has been extensively planted in California, and, with the object of lessening liability to droughts, along the line of the Central Pacific railway. It would probably thrive in any situation having a mean annual temperature not below 60° F., but it will not endure a temperature of less than 27° F. Its supposed property of reducing the amount of malaria in marshy districts is attributable to the drainage effected by its roots, rather than to the antiseptic exhalations of its leaves. To the same cause also is ascribed the gradual disappearance of mosquitoes in the neighbourhood of plantations of this tree, as at Lake Fezara, in Algeria.

Since about 1870, when the tree was planted in its cliothes, the monastery of St. Paol a la tre Fontana has become habitable throughout the year, although situated in one of the most fever-stricken districts of the Roman Campagna. An essential oil is obtained by aqueous distillation of the leaves of this and other species of Eucalyptus, which is known as eucalyptol, a pale yellowish fluid, when fresh prepared, with a characteristic odour and taste, of sp. gr. 0.910 to 0.930, and soluble in its own weight of alcohol. This consists of many different bodies, the most important of which is eucalyptol, a volatile oil, which constitutes about 70%.

868

EUCHARIS—EUCHARIST

On destructive distillation the leaves yield much gas, 10,000 cub. ft. being obtained from one ton. The wood is extensively used in Australia as fuel, and the timber is of remarkable size, strength, and durability. Maiden enumerates nearly 70 species as timber-yielding trees including E. amygdalina, the wood of which splits with remarkable facility, E. botrooides, hard, tough and durable and one of the finest timbers for shipbuilding, E. diversicolor or "kari," E. globulus, E. leucocoryn or iron bark, E. marginata or "jarrah" (see Jarrah Wood), E. obliqua, E. resinifera, E. siderophloia and others. The timber is often very hard, tough and durable, and useful for shipbuilding, building, fencing, planks, &c. The bark of different species of Eucalyptus has been used in paper-making and tanning, and in medicine as a febrifuge.

For further details see Baron von Müller's monograph of the genus, Eucalyptographia (Melbourne, 1879-1884); J. H. Maiden, Useful Native Plants of Australia (1889).

EUCHARIS, in botany, a genus of the natural order Amaryllidaceae, containing a few species, natives of Columbia. Eucalyptus amazonica or grandiflora is the best-known and most generally cultivated species. It is a bulbus plant with broad leaves, and flowers at the base of the stem, and a globular or short-stalked globe, 3 to 2 ft. long, bearing an umbel of three to ten large white showy flowers. The flowers resemble the daffodil in having a prominent central cup or corona, which is sometimes tinged with green. It is propagated by removing the offsets, which may be done in spring, potting them singly in 6-in. pots. It requires good loamy soil, with sand enough to keep the compost open, and should have a good supply of water and a temperature of 65° to 70° during the night, with a rise of 8° or 10° in the day. During summer growth is to be encouraged by repotting, but the plants should afterwards be slightly rested by removal to a night temperature of about 60°, water being withheld for a time, though they must not go too long dry, the plant being an evergreen. By the turn of the year they may again have more heat and more water, and this will probably induce them to flower. After this is over they may be shifted and grown again as before; and, as they get larger, either be divided to form new plants or allowed to develop into noble specimens. With a stock of the smaller plants to start them in succession, they may be had in flower all the year round. A few years ago the bulbs of E. amazonica were badly inflected with a disease known as the Eucharis mite, and all kinds of remedies were tried without avail, although steeping in Condy's fluid appeared to give the best results. The disease appears to have died out again. Other species of Eucharis now met with in gardens are E. Bakeriana, E. Mstersii, E. Lowii and E. Sanderii. A remarkable hybrid was raised a few years ago between Eucharis and the allied genus Urceolina, to which the compound name Urceocharis was given.

EUCHARIST (Gr. εὐχαριστία, thanksgiving), in the Christian Church, one of the ancient names of the sacrament of the Lord's Supper or Holy Communion. The term εὐχαριστία was at first applied to the act of thanksgiving associated with the sacrament; later, so early as the 2nd century, to the objects, i.e. the sacramental bread and wine, for which thanks were given; and so to the whole celebration. The term Missa, which has the same connotation, is derived from the Lat. missa or missio, because the celebrants, or communicants, or unbaptized believers, were dismissed before the eucharistic rite began. Other names express various aspects of the rite: Communion (Gr. κοινωνία), the fellowship between believers and union with Christ; Lord's Supper, so called from the manner of its institution; Sacrament as a consecration of material elements; the Mystery (in Eastern churches) because only the initiates participated; the Sacrifice as a rehearsal of Christ's passion. In this article the history of the rite is first traced up to A.D. 200 in documents taken in their chronological order; differences of early and later usage are then discussed; lastly, the meaning of the original rite is examined.

St Paul (1 Cor. xi. 17-34) attests that the faithful met regularly in church, i.e. in religious meetings, to eat the dominical or Lord's Supper, but that this aim was frustrated by some who ate up their provisions before others, so that the poor were left hungry.
while the rich got drunk; and the meetings were animated less by a spirit of brotherhood and charity than of division and faction. He directs that, when they so meet, they shall wait for one another. Those who are too hungry to wait shall eat at home; and not put to shame those who have no houses (and presumably not enough food either), by bringing their viands to church and selfishly eating them apart.

It was therefore not the quantity or quality of the food eaten that constituted the meal a Lord's Supper; nor even the circumstances that they ate it "in church," as was assumed by those guilty of the practices here condemned; but only the pervading sense of brotherhood and love. The contrast lay between the Dominical Supper or food and drink shared unselfishly by all with all, and the private supper, the feast of Dives, shamelessly gorged under the eyes of timid and shrinking Lazarus. By way of enforcing this point Paul repeats the tradition he had received direct from the Lord, and already handed on to the Corinthians, of how "the Lord Jesus on the night in which he was betrayed..." (not necessarily the night of Passover "took bread and having given thanks brake it and said, This is my body, which is for your sake; this do in remembrance of me. In like manner also the cup, after supper, saying, This cup is the new covenant through my blood: this do, as oft as ye drink it, in remembrance of me." Paul adds that this rite commemorated the Lord's death and was to be continued until he should come again, as in that age they expected him to do after no long interval: "As often as ye eat this bread and drink the cup, ye do (or ye shall) proclaim the Lord's death till he come."

The same epistle (x. 17) attests that one loaf only was broken and distributed: "We who are many, are one loaf (or bread), one body; for we all partake of the one loaf (or bread)." As a single loaf could not satisfy the hunger of many, the rehearsal in these meals of Christ's own action must have been a crowning episode, enhancing their sanctity. The Præcones Paulii, probably begun at the breaking of the cup certainly ended, the supper; the interval being occupied with the common consumption by the faithful of the provisions they brought. This much is implied by the words "after supper." If, in any case, all present had eaten in their homes beforehand, the giving of the cup would immediately follow on the breaking and eating of the one loaf, but Paul's words indicate that the common meal within the church was the norm. Those who ate at home marked themselves out as both greedy and lacking in charity. There is no demand that they should come fasting, or Paul could not recommend in (xi. 34) that those who were too hungry to wait until all the brethren were assembled in church, should eat at home and beforehand.

Mark xiv. 22-25, Matt. xxvi. 26-29, Luke xxi. 14-20, are, in order of time, our next accounts, Mark representing the oldest tradition. They all in substance repeat Paul's account; but identify the night on which Jesus was betrayed with that of the Pascha. In Matthew and Mark, Jesus says of the bread "Take ye it, this is my body," omitting the idea of sacrifice imported by Paul's addition "which is for you;" but in them Jesus enunciates the same idea when he says of the cup: "This is my blood of the covenant which is poured out for many," Matthew adding "for the remission of sins," a phrase which savours of Heb. ix. 22: "apart from the shedding of blood there is no remission." It is a later addition, and so may be the words "which is poured out for many." But the words which follow have an antique ring: "Amen, I say unto you, I will no more drink of the fruit of the vine, until that day when I drink it new in the kingdom of God." For here Jesus affirms his conviction, in view of his impending death, which unlike his disciples he foresaw, that, when the kingdom of God is instituted on earth, he will take his place in it. Thus is the last time he will sit down upon earth with his disciples at the table of the millennial hope. These sources do not hint that the Last Supper is to be repeated by Christ's followers until the advent of the kingdom. Luke's account is too much interpolated from Paul, and the texts of his oldest MSS. too disreputable, for us to rely on it except so far as it supports the other gospels. It emphasizes the fact that the Last Supper was the Pascha. "With desire have I desired to eat this Passover, before I suffer," and places the bread after the wine, unless indeed the Pauline interpolation comprises the whole of verse 19.

The fourth gospel, written perhaps a.d. 90-100, sublimates the rite, in harmony with its general treatment of the life of Jesus: "I am the living bread which cometh down out of heaven, that a man may eat thereof and not die." (John vi. 51.) As in 1 Cor. x. the flesh of Christ is contrasted with the manna which saved not the Jews from death, so here the latter asks: "How can this man give us his flesh to eat?"and Jesus answers: "Amen, Amen I say unto you, Except ye eat the flesh of the Son of Man and drink his blood, ye have not life in yourselves. . . . He that eateth my flesh and drinketh my blood abideth in me and I in him." In an earlier passage, again in reference to the manna, Jesus is called 4 the bread of God, which cometh down out of heaven, and giveth life unto the world." They ask: "Lord, ever more give us this bread," and he answers: 4 I am the bread of life: he that cometh to me shall not hunger, and he that believeth on me shall never thirst. This writer's thought is coloured by the older speculations of Philo, who in metaphor called the Logos the heavenly bread and food, the cupbearer and cup of God; and he seems even to protest against a literal interpretation of the words of institution, since he not only pointedly omits them in his account of the Last Supper, but in vv. 63 of this chapter writes: "It is the Spirit that quickeneth; the flesh profiteth nothing: the words that I have spoken unto you are spirit and are life." In Acts ii. 46 we read that, "the faithful continued steadfastly with one accord in the temple;" at the same time "breaking bread at home they partook of food with gladness and singleness of heart, praising God." All such repasts must have been sacred, but we do not know if they included the Eucharistic rite. The care taken in the selecting and ordaining of the seven deacons makes a religious character for the common meals, which they were to serve. Their main duty was to look after the duty of the Hellenistic widows, but inasmuch as meats strangled or consecrated to idols were forbidden, it probably devolved on the deacons to take care that such were not introduced at these common meals. The Essenes, similarly, appointed houses all over Palestine where they could safely eat, and priests of their own to prepare their food. Some Christians escaped the difficulties of their position by eating no meat at all. "He that is weak," says Paul (Rom. xiv. 1), "eateth herbs;" that is, becomes a vegetarian. Rather than scandalize weaker brethren, Paul was willing to eat herbs the rest of his life.

The travel-document in Acts often refers to the solemn breaking of bread. Thus Paul in xxvii. 35, having invited the ship's company of 270 persons to partake of food, took bread, gave thanks to God in the presence of all, and brake it and began to eat. The rest on board then began to be of good cheer, and themselves also took food. Here it is not implied that Paul shared his food except with his co-believers, but he ate before them all. Whether he repeated the words of institution we cannot say.

In Acts xx. 7 the faithful of Troas gather together to break bread "on the first day of the week" after sunset. After a discourse Paul, who was leaving them the next morning, broke bread and ate. This was surely such a meeting as we read of in 1 Cor. x., and was held on Sunday by night; but long before dawn, since after it Paul "talked with them a long while, even till break of day." In 1 Cor. xvi. 1 Paul bids the Corinthians, as he had bidden the churches of Galatia, lay up in store on the first of the week, each one of them, money for the poor saints of Jerusalem. This is the first notice of Sunday Eucharistic collections of almshouses for the poor.

Here seems to belong in the order of development the Cathar Eucharist (see CATHARS). The Cathars used only the Lord's prayer in consecrating the bread and used water for wine.

The next document in chronological order is the so-called Teaching of the Apostles (a.d. 90-110). This assigns prayers and rubrics for the celebration of the Eucharist:—
Eucharist

IX.
1. Now with regard to the Thanksgiving, thus give ye thanks:—
2. First concerning the cup:—We give thanks to thee, our Father, for the holy vine of David thy servant, which thou didst make known to us through Jesus Thy servant; and to thee be the glory for ever.
3. And concerning the broken bread:—We give thanks to thee, our Father, for the life and knowledge which thou didst make known to us through Jesus Thy servant; and to thee be the glory for ever.
4. As this broken bread was (once) scattered on the face of the mountains and, gathered together, became one, even so may thy Church be gathered together from the ends of the earth into thy kingdom; for thine is the glory and the power through Jesus Christ for ever.
5. But let no one eat or drink of your Thanksgiving (Eucharist), but they who have been baptized into the name of the Lord; for concerning this the Lord hath said, Give not that which is holy unto the dogs.  

X.
1. Then, after being filled, thus give ye thanks:—
2. We give thanks to thee, holy Father, for thy holy name, which thou has bestowed on us in the holy Christian liturgy, that through receiving, we may dwell in thy kingdom, and make the offering of the Body and Blood of the Son of God, the sacrifice of pure hearts, with minds of pure wills, and慮s of pure souls, after the pattern of the sacrifice of the first fruits, so that through the Body of the Son of God we may have the forgiveness of sins.
3. Thou Almighty Sovereign, dost create all things for thy name's sake, and food and drink thou didst give, been for enjoyment, that they should give thanks unto thee; but to thou didst of thy grace give spiritual food and drink and life eternal through thy servant.
4. Before all things, we give thee thanks that thou art mighty; to thee be the glory for ever.
5. Remember, Lord, thy church to deliver it from all evil, and to perfect it in thy love, and gather it together from the four winds, the sanctified, unto thy kingdom, which thou hast prepared for it; for thine is the power and the glory for ever.
6. Come, grace, and pass this world away. Hosanna to the God of David! If any one is holy, let him come. If any one is not, let him repent. Maranatha. Amen.

From a subsequent section, ch. xiv. 1, we learn that the Eucharist was on Sunday:— "Now when ye are assembled together on the Lord's day of the Lord, break bread and give thanks, having first confessed your transgressions, so that your sacrifice may be pure."

The above, like the uninterpolated Lucan account, places the cup first and has no mention of the body and blood of Christ. But in this last and other respects it contrasts with the other synoptic and with the Pauline accounts. The cup is not the blood of Jesus, but the holy vine of David, revealed through Jesus; and the holy vine can but signify the spiritual Israel, the Ecclesia or church or Messianic Kingdom, into which the faithful are to be gathered.
The one loaf, as in Paul, symbolizes the unity of the ecclesia, but the cup and bread, given for enjoyment, are symbols at best of the spiritual food and drink of the life eternal given of grace by the Almighty Father through his servant (lit. boy) Jesus. The bread and cup are indeed an offering to God, but they are not interpreted of the sacrifice of Jesus' body broken on the cross, or of his blood shed for the remission of sin. It is not, as in Paul, a meal commemorative of Christ's death, nor connected with the Passover, as in the Synoptics. Least of all is it a sacramental eating of the flesh and drinking of the blood of Jesus, a perpetual renewal of kinship, physical and spiritual, with him. The teaching rather breathes the atmosphere of the fourth gospel, which sets the Last Supper before the feast of the Passover (xiii. 1), and pointedly omits Christ's institution of the Eucharist, substituting for it the washing of his disciples' feet. The blessing of the Bread and Cup, as an incident in a feast of Christian brotherhood, is all that the Didache has in common with Paul and the Synoptists. The use of the words "after being filled," in x. 1, implies that the brethren eat heartily, and that the cup and bread formed no isolated episode. The Baptized alone are admitted to this Supper, and they only after confession of sins. Every Sunday at least they are to celebrate it. A prophet can "in the Spirit appoint a table," that is, order a Lord's banquet, through which God works. We add:  

1 Cor. x. 17; Soph. iii. 10.  
2 Matt. vii. 6.  
3 Matt. xxiv. 31.  
4 1 Cor. xvi. 22.  

Supper to be eaten, whenever he is warned by the Spirit to do so. But he must not himself partake of it—a very practical rule. The prophets are to give thanks as they like at these "breakings of bread," without being restricted to the prayers he has set forth. In xvi. 3 the overseers or bishops and deacons, though their functions are less spiritual than administrative and economic, are allowed to take the place of the prophets and teachers. The phrase used is λατρεύουσιν τῷ Μαρσαλίῳ, "to liturgize the liturgy." This word "liturgy" soon came to connote the Eucharist. The prophets who normally preside over the Suppers are called "your high-priests," and receive from the faithful the first-fruit iums of the winepress and threshing-floor, of oxen and sheep, and of each batch of new-made bread, and of oil. Out of these they provide the Suppers held every Lord's day, offering them as "a pure sacrifice." Bishops and deacons hold a subordinate place in this document; but the contemporary Epistle of Clement of Rome attests that these bishops "had offered the gifts without blame and hollyly." The word "liturgy" is also used by Clement.

Pliny's Letter (Epist. 96), written A.D. 112 to the emperor Trajan, about the Christians of Bithynia, attests that on a fixed day, stato die (no doubt Sunday), they met before dawn and recited antiphonally a hymn "to Christ as to a god." They then separated, but met again later to partake of a meal, which, as we learn from the corresponding information of the contemporary Tacitus, was regarded their meal as identical in character with the common meals of hetairiae, i.e. the trade-gilds or secret societies, which were then, as now, often inimical to the government. Even benefit societies were feared and forbidden by the Roman autocrats, and the "dominical suppers" of the Christians were not likely to be spared. Pliny accordingly forbade them in Bithynia, and the renegade Christians to whom he owed his information gave them up. These suppers included an Eucharist; for it was because the faithful ate in the latter of the flesh and blood of the Son of God that the charge of devouring children was made against them. If, then, this afternoon meal did not include it, Pliny's remark that their food was ordinary and innocent is unintelligible.

Ignatius, about A.D. 160, in his letter to the Ephesians, defines the one bread broken in the Eucharist as a "drug of immortality, and antecedent that we should not die, but live for ever in Jesus Christ." He also rejects as invalid any Eucharist not held "under the bishop or one to whom he shall have committed it." For the Christian prophet has disappeared, and with him the custom of holding the Eucharist in private dwelling houses.

In the Epistle to Diognetus, formerly assigned to Justin Martyr, we read (v. 7) that "Christians have in vogue among themselves a table common, yet not common" (i.e. unclear). In Justin's first apology (c. 140) we have two detailed accounts of the Eucharist, of which the first, in ch. 65, describes the first communion of the newly baptized:—

"After we have thus washed the person who has believed and conformed, we lead him to the brethren so called, where they are gathered together, to offer public prayer both for ourselves and for the whole human race, and all the things contingent to the end that having learned the truth we may be made worthy to be found not only in our actions good citizens, but guardians of the things enjoined."

The deacons kiss each other with a kiss at the end of the prayers. Then there is presented to the president of the brethren bread and a cup of water (and of a mixture) 7 and he having taken it sends up praise and glory to the father of all things by the name of the Son and Holy Spirit, and he offers at length Thanksgiving (ευχηριασθα) for the things that have been made worthy of thanks. But when he concludes the prayer and Thanksgiving all the people present answer with acclamation 'Amen.' But the word 'Amen' in Hebrew signifies 'so be it.' And when the president has given thanks, and all the people have answered, those who are called by us deacons distribute to each of those present, for them to partake of the bread (and wine) 8 and water, for which tokens have been given, and they carry portions away to those who are not present. And this food is called by us Eucharistia, and of it none may partake save those who believe our teachings to be true and have been washed in the bath which is for remission of sin and rebirth, and who so live as

7 We should probably omit the words bracketed.
8 The codex Othobonianus omits the words bracketed.
CHRIST taught. For we do not receive these things as common bread or common drink. For as Jesus Christ our Saviour was made flesh by Word of God and possessed flesh and blood for our sake; so we have been taught that the food blessed (lit. thanked for) by prayer of Word spoken by him, food by which our blood and flesh are by change of it (into them) nourished, is both flesh and blood of Jesus so made flesh. For the apostles in the memorials made by them, which are called gospels, have so related it to have been enjoined on them, that Jesus took bread, gave thanks and said: This do ye in memory of me, this is my body, and the cup likewise he took and gave thanks and said, This is my blood; and he distributed to them alone. And this rite too the evil demons by way of imitation handed down in the mysteries of Mithras. For that bread and a cup of water is presented in the rites of their initiation with certain conclusions (or epilogues), you either know or can learn.

The second account, in ch. 67, adds that the faithful both of town and country met for the rite on Sunday, that the prophets were read as well as the gospels, that the president after the reading delivered an exhortation to imitate in their lives the godly narratives; and that each brought offerings to the president out of which he aided orphans and widows, the sick, the prisoners and the strangers sojourning with them. These contributions of the faithful and of the president were thus distributed also along with the bread and cup as sacrifices acceptable to God. But he also particularly specifies (Dialog. 345) that perfect and pleasing sacrifices alone consist in prayers and thanksgivings (θυσίαις). The elements are gifts or offerings. Justin was a Roman, but may not represent the official Roman church. The rite as he pictures it agrees well with the developed liturgies of a later age.

Irenaeus (Gaul and Asia Minor, before 190) in his work against heresies, iv. 31, 4, points to the sacrament in proof that the human body may become incorruptible: "As bread from the earth on receiving unto itself the invocation of God is no longer common bread, but is an Eucharist, composed of two elements, an earthly and a heavenly, so our bodies by partaking of the Eucharist cease to be corruptible, and possess the hope of eternal resurrection.'

There is a similar passage in the 36th fragment (ed. Harvey ii. p. 500), sketching the rite and calling the elements antitypes: "The obligation of the Eucharist is not fleshly, but spiritual and so pure. For we offer to God the bread and the cup of blessing (εὐλαχία), thanking him for that he bade the earth produce these fruits for our sustenance. And there with having finished the offering (προσφέραμεν) we invoke the Holy Spirit to constitute this offering, both of the bread and the cup of the blood of Christ, that those who partake of the antitype (ἀντιτύπως, i.e. surrogates) may win remission of sins and life eternal.'

Here we note the stress laid on the Invocation of the Spirit to operate the transformation of the elements, though in what sense they are transformed is not defined. This Epiklesis survives in the Greek liturgies, but in the Roman a prayer takes its place that the angel of the Lord may take the obligation laid on the visible altar, and carry it up to the altar sublime into the presence of the divine majesty. We must not forget that the church of Irenaeus was Greek.

To the second century, lastly, belongs in part the evidence of the catacombs, on the walls of which are depicted persons reclining at tables supporting a fish, accompanied by one or more baskets, and more rarely by flasks of wine or water. The fish represents Christ; and in the Inscription of Abercius, bishop of Hierapolis about A.D. 160, we have this symbolism enshrined in a literary form: "In company with Paul I followed, while everywhere Faith led the way, and set before me the fish from the fountain, mighty and stainless, whom a pure virgin grasped, and gave this to friends to eat always, having good wine and giving the mixt cup with bread. This representation of baskets of loaves and several fishes, or of one fish and several loaves, seems to contradict the usage of one loaf. It may represent the ἀγαθὸς or Lord's Supper as a whole, of which the one loaf and cup formed an episode. Or the entire stock of bread may have been regarded as flesh of Jesus in virtue of the initial consecration of one single loaf.

To the second century also belong two gnostic writings. Firstly, that of Marcus, a Valentinian, of South Gaul about 150, whose influence extended to Asia Minor. Irenaeus relates (Dk. I, ch. vii. 2), that this "magician" used in the Eucharist cups apparently mist with wine, but really containing water; and during long invocations made the worshippers purple and red, as if the universal Grace ὑπάρχειan ἐναλλακτικά, some of her blood into cup through his invocation, and by way of inspiring worshippers with a passion to taste the cup and drink deep of the influence termed Charis. Such a rite presupposes a belief in a real change of the elements; and water must have been used. In the sequel Irenaeus recites the Invocation read by Marcus before the communicants: "Grace that is before all things, that passeth understanding and words, replenish thy inner man, and make to abound in thee the knowledge of her, sowing in the good soil the grain of mustard seed" (Matthew 13:31).

The Acts of Thomas, secondly, ch. 49, attests an Eucharistic usage, somewhat apart from the orthodox. The apostle spreads a linen cloth on a bench, lays it on bread of blessing (εὐλαχία), and says: "Jesus Christ, Son of God, who hast made us worthy to commune in the Eucharist of thy holy body and precious blood, Lo, we venture on the thanksgiving (Εὐχαριστία) and invocation of thy blessed name, come now and communicate with us. And he began to speak and said: Come Pity supreme, come communion of the man, come Lady who knowest the mysteries of the Elect one, . . . secret mother . . . come and communicate with us in this Eucharist which we perform in thy name and in the love (ἀγάπη) in which we have been united at thy command, . . . come and upon the cross upon the bread, and break it and began to distribute it. And first he gave to the woman, saying: This shall be to thee for remission of sins and release of eternal transgressions. And after her he gave and blessed and sent the rest to the others."

In the 2nd century the writer who nearest approaches to the later idea of Transubstantiation is the gnostic Theodotus (c. 160).

The bread no less than the oil is hallucinated, and derived from the name. They remain the same in outward appearance as they were received, but by that power they are transformed into a spiritual power. So the water when it is exorcised and becomes blood, incites us to drive out the evil principle, but also contracts a power of hallowing.

In the Fathers of the first three or four centuries can be traced the same tendency to spiritualize the Eucharist as we encountered in the fourth gospel, and in the Didache. Ignatius, though in Smyrn. 7 he asserts the Eucharist to be Christ's "flesh which suffered for our sins," elsewhere speaks of the blood as being "joy eternal and lasting," as "hope," as "love incorruptible," and of the flesh as "faith" or as "the gospel." Clement of Alexandria (c. 180) regards the rite as an initiation in divine knowledge and immortality. The only food he recognizes is spiritual; e.g. knowledge of the divine Essence is "eating and drinking of the divine Word." So Origen declares the bread which the God Word asserted was his body to be that which nourishes souls, the word from God the Word proceeding, the Bread from the heavenly Bread. Not the visible bread held in his hand, nor the visible cup, was Christ's body and blood, but bread in the mystery of which the bread was to be broken and the wine to be poured out. "We drink Christ's blood," he says elsewhere, "when we receive His words in which standeth Life." So the author of the Contra Marcellum writes in view of John vi. 63 as follows (De excl. theol. p. 180): "In these words he instructed them to interpret in a spiritual sense his utterances about his flesh and blood. Do not, he said, think that I mean the flesh which invests and covers me, and blood which issues from my veins; nor sound what I have said to you to drink my sensible and somatic blood. Nay, you know well that my words which I have spoken unto you are spirit and life. It follows that the very words and discourses are his flesh and blood, of which he is the substance and the object, the spiritual and carnal, of which he partakes, and which are both spiritual and carnal, will partake of the heavenly bread. Let not then he who hears this scandalize you which I have said about eating of my flesh and about drinking of my blood. Nor let the obvious and first hand meaning of these words be so far from the mind of him who hears you to you when you hear it for these words are not only heard and understood literally (or sensibly). But it is the spirit which quickens them that can understand spiritually what they hear."

But these views were not those of the uninstructed pagans who filled the churches and needed a rite which brought them, as their old sacrifices had done, into physical contact and union with their god. Their point of view was better expressed in the scruples of priests, who, as Tertullian (c. 200) records (De
Corona, iii), were careful lest a crust of the bread or a drop of
the wine should fall on the ground, and by such incidents the
body of Christ be harassed and attacked!

The Eucharist as a Sacrifice.—Before the 3rd century we cannot
trace the view that in the Eucharistic rite the death of Christ,
regarded from the Pauline standpoint as an atoning or redemptive
sacrifice for the sins of mankind, is renewed and repeated, though
the germ out of which it would surely grow is already present
in the words “My blood . . . which is shed for many” of Matt.
and Mark; yet more surely in Paul’s “my body which is in your
behoof” and “this do in remembrance of me,” where the
Greek word for ἐστίν, Gr. σώστε, Lat. jacte, could to pegan ears mean
“this do ye sacrifice.” In the first two centuries the rite
is spoken of as an offering and as a bloodless sacrifice; but it is
God’s own creations, the bread and wine, alms and first-fruits,
which, offered with a pure conscience, he receives as from
friends, and bestows in turn on the poor; it is the praise and
prayers which are the sacrifice. In these centuries baptism was
the rite for the remission of sins, not the Eucharist; it is the
prophet in the Didache who presides at the Lord’s Supper, not
the Levitically conceived priest; nor as yet has the Table
become an Altar. Among Christians, prayers, supplications and
thanksgivings have taken the place of the sacrifices of the old
covenant.

In Cyprian of Carthage (c. 250) we first find the Eucharist
regarded as a sacrifice of Christ’s body and blood offered by
the priest for the sins of the living and dead. We cannot drink the
blood of Christ unless Christ has been first trodden under foot
and passed. . . . As Jesus our high priest offered himself as a
sacrifice to his Father, so the human priest takes Christ’s place,
and imitates his action by offering in church a true and full
sacrifice to God the Father (Ep. 63). He speaks of the dominical
host (hóstia), and takes the verb to ἀρνησθαι in the sense of
to sacrifice. As early as Tertullian prayers for the dead, who
were named, were offered in the rite; but there was as yet no
idea of the sacrifice of Christ being reiterated in their behalf.
After Cyprian’s day this view gains ground in the West, and
almost obscures the older view that the rite is primarily an act
of communion with Christ. In harmony with Cyprian’s new
conception is another innovation of his age and place, that
of children communicating; both were the natural accomplishment
of infant baptism, of which we first hear in his letters. In the
East the ritual of the sacrifice of the body and blood before
Eusebius, about the year 300. In the Armenian church of the
17th century the idea of a reiterated sacrificial death of Christ
still seemed bizarre and barbarous.1 But as early as 358 in Gaul
the bread was arranged on the altar in the form of a man, so
that one believer ate his eye, another his ear, a third his hand,
and so on, according to their respective merits! This was for-
bidden by Pope Pelagius I; but in the Greek church the custom
survives, the priest even stabbmg with “the holy spear” in its
right side the human figure planned out of the bread, by way of
rehearsing in pantomime the narrative of John xix. 34.

The change from a consecration of the Passion to a re-
acting of it slowly in the Greek church. Thus Chrysostom
( הלל. 17, ad Heb.), after writing “We offer (ῥουσάμενον)
not another sacrifice, but the same,” instantly corrects himself and adds: “or rather we perform a consecration of the sacrifice.”

This was exactly the position also of the Armenian church.

Wine or Water?—Justin Martyr perhaps contemplated the use
of water instead of wine, and Tatian his pupil used it. The
Marcionites, the Valentinians, or Judaism in Chaldea and Palestine,
the Montanists of Phrygia, Africa and Gaetulia, the heresiarch
Alciabrides of Lyons, c. A.D. 177 (Euseb. Hist. Eccl. v. 3. 2),
equally used it. Cyprian (Ep. 63) affirms (c. 250) that his
predecessors on the throne of Carthage had used water, and that
many African bishops continued to do so, “out of ignorance,”
he says, “and simplicity and mind, and God would forgive them.”
Pionius, the Catholic martyr of Smyrna, c. 250, also used water.
In the Acts of Thomas it is used. Such uniformity of language
has led Prof. Harnack to suppose that in the earliest age water
was used equally with wine, and Eusebius the historian, who had
means of judging which we have not, saw no difficulty in identifying
with the first converts of St Mark the Therapeute of Philo
who took only bread and water in their holy repast.

Abercius and Irenæus are the first to speak of wine mixed with
water, of a krāma (κραμά) or temperamentum. In the East,
then as now, no one took wine without so mixing it. Cyprian
insists on the admixture of water, which, he says represented
the humanity of Jesus, as wine his godhead. The users of water were
tended Aquarii or hydroporastae in the 4th century, and were
liable to death under the code of Theodosius. Some of the
Monophysite churches, e.g. the Armenian, eschewed water and
used pure wine, so falling under the censure of the council in
Trullo of A.D. 692. Milk and honey was added at first
comunions. Oil was sometimes offered, as well as wine, but it
would seem for consecration only, and not for consumption along
with the sacrament. With the bread, however, was sometimes
consecrated cheese, e.g. by the African Montanists in the 2nd
century. Bitter herbs also were often added, probably because
they were eaten with the Paschal lamb. Many early canons
forbade the one and the other. Hot water was mixed with the
wine in the Greek churches for some centuries, and this custom
is seen in catacomb paintings. It increased the resemblance to
real blood.

Position of the Faithful at the Eucharist.—Tertullian, Eusebius,
Chrysostom and others represent the faithful as standing at
the Eucharist. In the art of the catacombs they sit or recline in
the ordinary attitude of banqueters. In the age of Christ standing
up at the Paschal meal had been given up, and it was become
the rule to recline. Kneeling with a view to adoration of the
elements was unheard of in the primitive church, and the
Armenian Fathers of the 12th century insist that the sacrament
was intended by Christ to be eaten and not gazed at (Nerces, op.
cit. p. 167). Eucharistic or any other liturgical vestments were
unknown until late in the 5th century, when certain bishops
were honoured with the same pallium worn by civil officials (see
VESTMENTS).

In the Latin and in the Monophysite churches of Armenia
and Egypt unleavened bread is used in the Eucharist on the
somewhat uncertain ground that the Last Supper was the Paschal
meal. The Greek church uses leavened.

Truly the Eucharist was an act of Arithmetic where no one asked
how Christ was present in the Eucharist, or how the elements became
his body and blood. The Eucharist formed part of an agape
or love feast until the end of the 2nd century, and in parts of
Christendom continued to be so much later. It was, save where
animal sacrifices survived, the Christian sacrifice, par excellence,
the counterpart for the converted of the sacrificial communions
of paganism; and though charged with higher significance than
these, it yet reposed on a like background of religious usage and
beliefs. But when the Agape on one side and paganism on the
other receded into a dim past, owing to the enhanced sac-
sanctity of the Eucharist and because of the severe edicts of the
emperor Theodosius and his successors, the psychological back-
ground fell away, and the Eucharist was left isolated and hanging
in the air. Then men began to ask themselves what it meant.
Rival schools of thought sprang up, and controversy raged over
it, as it had aforetime about the homoeosis, or the two natures.
Thus the sacrament which was intended to be a bond of peace,
became a cause of dissension and bloodshed, and was often
dissociated as if it were a vulgar talisman.

Egypt, a younger contemporary of A狂欢us, in his Eucharistic prayers combines the language of the Didache with a high sacramentalism alien to that document which now only survived in the form of a grace used at table in the
nunneries of Alexandria (see Aглаве). He entreats “the
Lord of Powers to fill this sacrifice with his Power and Participation,” and calls the elements a “living sacrifice, a bloodless offering.” The bread and wine before consecration are “like-
nesses of his body and blood,” this in virtue of the words pro-
nounced over them by Jesus on the night of his betrayal. The
prayer then continues thus: "O God of truth, let thy holy Word settle upon this bread, that the bread may become body of the word, and on this cup, that the cup may become blood of the truth. And cause all who communicate to receive a drug of life for healing of every disease and empowering of all moral advance and virtue." Here the bread and wine become by consecration tenements in which the Word is reincarnated, as he aforetime dwelled in flesh. They cease to be mere likenesses of the body and blood, and are changed into receptacles of divine power and intimacy, by swallowing which we are benefitted in soul and body. Cyril of Jerusalem in his catechises 5 enunciates the same idea of μεταβολή or transformation.

Gregory of Nyssa also about the same date (in Migne, Patrolog. Graec, vol. 46, col. 581, oration on the Baptism) asserts a "transformation" or "transaelementation" (μεταστροφή, μετατομή) of the elements into centres of mystic force; and assimilates their consecration to that of the water of baptism, of the altar, of oil or chrism, of the priest. He compares it also to the change of Moses' rod into a snake, of the Nile into blood, to the virtue inherent in Elijah's mantle or in the wood of the cross or in the clay mixt of dust and the Lord's spittle, or in Elisha's relics which, he says, were "parcels of matter destitute of life and feeling, but through miracles they became vehicles of the power of God absorbed or taken into themselves." He thus views the consecration of the elements as akin to other consecrations; and, like priestly ordination, as involving "a metamorphosis for the better," a phrase which later on became classical. John of Damascus (c. 750) believed the bread to be mysteriously changed into the Christ's body, just as when eaten it is changed into any human body; and he argued that it is wrong to say, as Ireneaus had said, that the elements are mere antitypes after as before consecration. In the West, Augustine, like Eusebius and Theodoret, calls the elements signs or symbols of the body and blood signified in them; yet he argues that Christ "took and lifted up his own body in his hands when he took the bread." At the same time he admits that "no one eats Christ's flesh, unless he has first adored it" (nisi prius adoraverit). But he qualifies this "Receptionist" position by declaring that Judas received the sacrament, as if the unworthiness of the recipient made no difference.

Thus the mass of contradictions scholastic thought strove to emerge by means of clear-cut definitions. The drawback for the dogmatist of such a view as Serapion broaches in his prayers was this, that although it explained how the Logos comes to be immanent in the elements, as a soul in its body, nevertheless it did not guarantee the presence in or rather substitution for the natural elements of Christ's real body and blood. It only provided an αἵρεσις or surrogate body. In 830-839, Paschasius Radbert taught that after the priest has uttered the words of institution, nothing remains save the body and blood under the outward form of bread and wine; the substance is changed and the accidents alone remain. The elements are miraculously recreated as body and blood. This view harmonized with the docetic view which lurked in East and West, that the manhood of Jesus was but a likeness or semblance under which the God was concealed. So Marcion argued that Christ's body was not really flesh and blood, or he could not have called it bread and wine. Paschasius shrank from the logical outcome of his view, namely, that Christ's body or part of it is turned into the view, moment, that Christ is another body. In a book afterwards ascribed to Duns Scotus, he drew this inference in order to discredit his antagonists, and not because he believed it himself. The elements, he said, remain physically what they were, but are spiritually raised as symbols to a higher power. Perhaps we may illustrate his position by saying that the elements undergo a change analogous to what takes place in iron, when by being brought into an electric field it becomes magnetic. The substance of the elements remain as well as their accidents, but like baptismal water they gain by consecration a hidden virtue benefitting soul and body. Ratsammus's view thus resembled Serapion's, after whom the elements furnish a new vehicle of the Spirit's influence, a new body through which the Word operates, a fresh sojourning among us of the Word, though consecrated bread is in itself no more Christ's natural body than are we who assimilate it. Other doctors of the 9th century, e.g. Hincmar of Reims and Haimo of Halberstadt, took the side of Paschasius, and affirmed that the substance of the bread and wine is changed, and that God leaves the colour, taste and other outward properties out of mercy to the worshippers, who would be overcome with dread if the underlying real flesh and blood were nakedly revealed to their gaze!

Beregrar in the 11th century assailed this view, which was really that of transubstantiation, alleging that there is no substance in matter apart from the accidents, and that therefore Christ cannot be corporally present in the sacrament; because, if so, he must be spatially present, and there will be two material bodies in one space; moreover his body will be in thousands of places at once. Christ, he said, is present spiritually, so that the elements, while remaining what they were, were unremoulded and undestroyed, are advanced to be something better: omne cui a Deo benedicatur, non absim, non auferri, non destruct, sed manere et in mensa quam erat necessario pervelit. This was the phrase of Gregory of Nyssa.

Beregrar in a weak moment in 1059 was forced by the pope to recant and assert that "the true body and blood are not only a sacrament, but in truth touched and broken by the hands of the priests and pressed by the teeth of the faithful," and this position remains in every Roman catechism. Such dilemmas as whether a mouse can devour the true body, and whether it is not involved in all the obscenities of human digestive processes, were ill met by this ruling. Each party dubbed the other stercoranists (dung-feasters), and the controversy was often marred by indecencies.

As in the 3rd century the Roman church decided in respect of baptism that the sacrament carries the church and not the church the sacrament, so in the dispute over the Eucharist it ended, in spite of more spiritual views essayed by Peter Lombard, by insisting on the more materialistic view at the fourth Lateran Council in 1215, whose decree runs thus: "The body and blood of Jesus Christ are truly contained in the sacrament of the altar under the species of bread and wine, the bread and wine respectively being transsubstantiated into body and blood by divine ordination, so that in order to the perfecting of the mystery of unity we may ourselves receive from his (body) what he himself receives from ours." In 1264 Urban IV. instituted the Corpus Christi Feast by way of giving liturgical expression to this view.

Communion in One Kind.—Up to about 1100 laymen in the West received the communion in both kinds, and except in a few disciplinary cases the wine was not refused. In 1009, by a decree of Pope Paschal II., children might omit the wine and invalidate the bread. The communion of the laity in the bread alone was enjoined by the council of Constance in 1415, and by the council of Trent in 1562. The reformed churches of the West went back to the older rule which Eastern churches had never forsaken.

Mass.—The term mass, which survives in Candlemas, Christmas, Michaelmas, is from the Latin missa, which was in the 3rd century a technical term for the dismissal of any lay meeting, e.g. of a law-court, and was adopted in that sense by the church as early as Ambrose (c. 350). The catechumens or unbaptized, together with penitents, received bread and wine. In the Eastern Church, collect, three lections, two psalms and homily. The deacon then cried out: "Let the catechumens depart. Let all catechumens go out." This was the missa of the catechumens. The rest of the rite was called missa fidelium, because only the initiated remained. Similarly the collect with which often the rite begins is the prayer ad collectam, i.e. for the congregation met together or collected. The corresponding Greek word was συναξις.

After the catechumens were gone the priest said: "The Lord be with you, let us pray," and the service of the mass followed.

In the West, says Duchesne (Origines, p. 179), not only
catechumens, but the baptized who did not communicate left the church before the communion of the faithful began (cf. the communion of the clergy). In Anglican churches non-communi-
cants used to leave the church after the prayer for the Church.
Militant. Ritualists now keep unconfirned children in church
during the entire rite, through ignorance of ancient usage, in
order that they may learn to adore the consecrated elements.
For this moment of homage to material elements ritually filled
with divine potency may be so exaggerated as to obscure the
rite’s ancient significance as a communion of the faithful in
mystic food.

Ideas of Reformers.—The 16th-century reformers strove to
avoid the literalism of the words “This is my body,” accepted
frankly by the Roman and Eastern churches, and urged a
Receptionist view, viz. that Christ is in the sacrament only
spiritually consumed by worthy recipients alone, the material
body not being actually chewed. This is seen by a comparison
of other confessions with the Profession of Catholic Faith in
accordance with the council of Trent, in the bull of Pius IV,;
which runs thus:—

“I profess that in the Mass is offered to God a true, proper
and professional sacrifice, viz. the entire Body and Blood
and the Soul and Divinity of our Lord Jesus Christ, and
that there does take place a conversion of the entire substance of the bread into the body, and of
the wine into the Blood, which contains the spiritual
body of Christ, in our Catholic Church doth call Transubstantiation. I also admit that under one of the other species alone the entire and whole
Christ and the true sacrament is received.”

The 28th Article of Religion of the Church of England is as
follows:—

“The Supper of the Lord . . . is a Sacrament of our Redemption
by Christ’s death; insomuch that to such as rightly, worthily,
and with faith, receive the same, the Bread which we break
is a partaking of the Body of Christ, and likewise the Cup of Blessing is a partaking
of the Blood of Christ.

“Body of Christ . . . cannot be proved by holy writ . . .

“The Body of Christ is given, taken and eaten, in the Supper, only
after a heavenly and spiritual manner. And the mean whereby
the Body of Christ is received and eaten in the Supper is Faith.

“The Sacrament of the Lord’s Supper was not by Christ’s ordinance reserved, carried about, lifted up, or worshipped.”

At the end of the communion rite the prayer-book, in view
of the ordinance to receive the Sacrament kneeling, adds the
following:—

“It is hereby declared, that thereby no adoration is intended,
or ought to be done, either unto the Sacramental Bread or Wine,
thereto bodily received, or unto any Corporal Presence of Christ’s
natural Flesh and Blood. For the Sacramental Bread and Wine remain in every natural substance, and therefore may not be adored (for that were idolatry, to be adored of all faithful Christians); and the natural Body and Blood of our Saviour Christ are in Heaven, and not here; it being against the truth of Christ’s natural Body to be at one time in more places than one.

These monitions and prescriptions are rapidly becoming a dead-
letter, but they possess a certain historical interest.

The Helvetic Confession 1 of A.D. 1506 (capit 22. De sacra
coea Domini) runs as follows:—

“That it may be more rightly and clearly understood how the
flesh and blood of Christ can be food and drink of the faithful, and
be received by them unto eternal life, let us add these few remarks.
Chewing is not of one kind alone. For there is a corporeal chewing,
by which Our Lord took the flesh of Christ, which was offered unto Him,
beviused with the teeth and swallowed down into the belly. . . . As the flesh of Christ
cannot be corporeally chewed without wickedness and truculence,
so it is not food of the belly. . . . There is also a spiritual chewing of the
flesh of Christ, not such as by it we understood the very
food to be changed into spirit, but such that, the body and blood of
the Lord abiding in their essence and peculiarity, they are spiritually
communicated to us, not in any corporeal way, but in a spiritual,
through the Spirit, by which we partake quite otherwise of things which were prepared through the flesh and blood of the Lord
betrayed for our sake to death, to wit, remission of sins, liberation
and life eternal, so that Christ lives in us and we in Him . . .

The additional to the aforesaid spiritual chewing, there is also a sacramen-
tual chewing of the Lord’s body, by which the faithful not only
partake spiritually and inwardly of the true body and blood of the
Lord, but outwardly by approaching the Lord’s table, receives the

1 This represents the views of Calvin.
visible sacrament of his body and blood. . . . But he who without faith approaches the sacred table, albeit he communicate in the sacrament, yet he perceives not the matter of the sacrament, whence is life and salvation. . . .”

The Augustan Confession presented by the German electors
to Charles V, in the section on the Mass merely protests against
the view that “the Lord’s Supper is a work (opus) which is being
performed by a priest earns remission of sin for the doer and for
others, and that in virtue of the work done (ex opere operato),
without a good motive on the part of the user. Also that being
applied for the dead, it is a satisfaction, that is to say, earns for
the remission of the pains of purgation.”

The Sacrament of the Church of Wittenberg, June 1551, while protest-
ing against the same errors, equally abstains from trying to
define narrowly how Christ is present in the sacrament.

Consubstantiation.—The symbolical books of the Lutheran
Church, following the teaching of Luther himself, declare the
discipline of the real presence of Christ’s body and blood in the
eucharist, together with the bread and wine (consubstantiation),
as well as the ubiquity of his body, as the orthodox doctrine
of the church. One consequence of this view was that the
unbelieving recipients are held to be as really partakers of the
body of Christ in, with and under the bread as the faithful,
though they receive it to their own hurt. (Hagenbach, Hist. of
Doctri. ii. 300.)

Of all the Reformers, the teaching of Zwingli was the farthest
removed from that of Luther. At an early period he asserted
that the Eucharist was nothing more than food for the soul,
and had been instituted by Christ only as an act of commemo-
ration and as a visible sign of his body and blood (Christliche
Yuleitung, 1523, quoted by Hagenbach, Hist. of Doctri. ii. 956.
Clark’s translation). But that Zwingli did not reject the higher
reality or significance of the Eucharist, and was far from degrading
the bread and wine into “nuda et inania, symbola,” as he was accused of doing, we see from his Fidel ratio ad Carolum Impera-
torem (ib. p. 297).

Original Significance of the Eucharist.—It is doubtful if the
attempts of reformers to spiritualize the Eucharist bring us,
except so far as they pruned ritual extravagances, nearer to its
original significance; perhaps the Roman, Greek and Oriental
churches have better preserved it. This significance remains
to be discussed; the cognate question of how far the development
of the Eucharist was influenced by the pagan mysteries is
discussed in the article SACRAMENT.

That the Lord’s Supper was from the first a meal symbolic of
Christian unity and commemorative of Christ’s death is questioned by none. But Paul, while he saw this much in it,
saw much more; or he could not in the same epistle, x. 18-22,
assimilate communion in the flesh and blood of Jesus, on the one
hand, to the sacrificial communion with the altar which made
Israel after the flesh one; and on the other to the communion
with devils attained by pagans through sacrifices offered before
idols. It has been justly remarked of the Pauline view, that—

“The union with the Lord Himself, to which those who partake
of the Lord’s Supper have come, is hereafter, that those who
partake of a sacrifice have with the deity to whom the altar
is devoted—in the case of the Israelites with God, of the heathen
with demons. This idea that to partake of sacrifice is to devote
one self to the deity, lies at the root of the ancient idea of worship,
whether Jewish or heathen; and St Paul uses it as being readily
understood. In this connexion the symbol is never a mere symbol,
but a means of real union. The cup is the covenant” (Prof.
Westcott in Hastings’ Dictionary of the Bible, s. 149).

Paul caps his argument thus:—“Ye cannot drink the cup of
the Lord and the cup of demons; ye cannot partake of the table
of the Lord and of the table of demons. Or do we provoke
the Lord to jealousy? Are we stronger than he?” And these
words with their context prove that Paul, like the Fathers of
the Church, regarded the gods and goddesses as real living
supernatural beings, but malignant. They were the powers
and principalities with whom he was ever at war. The Lord
also is jealous of them, if any one attempt to combine their
cult with his, for to do so is to doubt the supremacy of his
name above all names. Both in its inner nature then and outward
EUCARIST

effects the Eucharist was the Christian counterpart of these two other forms of communion of which one, the heathen, was excluded from the first, and the other, the Jewish, soon to disappear. It is their analogue, and to understand it we must understand them, not forgetting that Paul, as a Semite, and his hearers, as converted pagans, were imbued with the sacrificial ideas of the old world.

"A kin," remarks W. Robertson Smith (Religion of the Semites, 1894), "was a group of persons whose lives were so bound up together, in what must be called a physical unity, that they could be treated as parts of one common life. The members of one kindred looked on themselves as one living whole, a single animated mass of blood, flesh and bones, of which no member could be excluded without all the members suffering." "In later times," observes the same writer (op. cit. p. 313), "we find the conception current that any food which two men partake of together, so that the same substance enters into their flesh and blood, is enough to establish some sacred unity of life between them; but in ancient times this significance seems to be always attached to participation in the flesh of a sacrificial victim, and the solemn mystery of its death is justified by the consideration that only in this way can the sacred cement be procured, which creates or keeps alive a living bond of union between the worshippers and their god. This cement is nothing else than the actual life of the sacred and kindred animal, which is conceived as residing in its flesh, but especially in its blood, and so, in the sacred meal, is actually distributed among all the participants, each of whom incorporates a part of it with his own individual life."

The above conveys the cycle of ideas within which Paul's reflection worked. Christ who knew no sin (2 Cor. v. 21) had been made sin, and sacrificed for us, becoming as it were a new Passover (1 Cor. v. 7). By a mysterious sympathy the bread and wine over which the words, "This is my body which is for you," and "This cup is the new covenant in my blood," had been blessed, the partaking of these the faithful were united with each other and with Christ into one kinship. They became the body of Christ, and his blood or life was in them, and they were members of him. Participation in the Eucharist gave actual life, and it was due to their irregular attendance at it that many members of the Christian church, "were weak and sickly and not a few slept" (i.e. had died). As the author already cited adds (p. 313):

"The notion that by eating the flesh, or particularly by drinking the blood, of another living being, a man absorbs its nature or life into his own, is one which appears among primitive peoples in many forms."

But this effect of participation in the bread and cup was not in Paul's opinion automatic, was no mere opus operatum; it depended on the ethical co-operation of the believer, who must not eat and drink unworthily, that is, after refusing to share his meats with the poorer brethren, or with any other guilt in his soul. Luke had added: "discern the body" and "discern ourselves" in 1 Cor. xi. 29, 31 are obscure. Paul evidently plays on the verb, koinó, diakoinó, katakoinó (κοινό, διακοινό, κατακοινό), the general sense is clear, that those who consume the holy food without a clear conscience, like those who handle sacred objects with impure hands, will suffer physical harm from its contact, as if they were undergoing the ordeal of touching a holy thing. The idea, therefore, seems to be that as we must distinguish the holy food over which the words "This is my body" have been uttered from common food, so we must separate ourselves before eating it from all that is guilty and impure. The food that is taboo must only be consumed by persons who are equally taboo or pure. If they are not pure, it condemns them.

The "one" loaf has many parallels in ancient sacrifices, e.g. the Latin tribes when they met annually at their common temple partook of a "single" bull. And in Greek Panegureis and festivals the sacrificial wine had to be dispensed from one common bowl: "Unto a common cup they come together, and from it pour libations as well as sacrifice," says Aristides.

Rhetor in his Isthmica in Neptunum, p. 45. To ensure the continued unity of the bread, the Roman church ever leaves over from a preceding consecration half a holy wafer, called fermentum, which is added in the next celebration.

With what awe Paul regarded the elements mystically identified with Christ's body and life is clear from his declaration in 1 Cor. xi. 27, that he who consumes them unworthily is guilty or holds the Lord's body and blood. This is the language of the ancient ordeal which as a test of innocence required the accused to touch or still better to eat a holy element. A wife who drank the holy water in which the dust of the Sanctuary was mingled (Num. v. 17 foll.) offended so deeply against it, if unfaithful, that she was punished with dropsy and wasting.

The very point is paralleled in the Acts of Thomas, ch. xlvii. A youth who has murdered his mistress takes the bread of the Eucharist in his mouth, and his two hands are at once withered up. The apostle immediately invites him to confess the crime he must have committed, "for, he says, the Eucharist of the Lord hath convicted thee."

It has been necessary to consider at such length St Paul's account of the Eucharist, both because it antedates nearly by half a century that of the gospels, and because it explains the significance which the rite had no less for the Gnostics than for the great church. The synoptists' account is to be understood thus: Jesus, conscious that he now for the last time lies down to eat with his disciples a meal which, if not the Paschal, was anyhow anticipatory of the Millennial Regeneration (Matt. xix. 22), institutes, as it were, a blood-brotherhood between himself and them. It is a covenant similar to that of Exodus xxv., when after the peace-offering of oxen, Moses took the blood in basins and sprinkled half of it on the altar and on twelve pillars erected after the twelve tribes, and the other half on the people, to whom he had first read out the writing of the covenant and said, "Behold the blood of the covenant which the Lord hath made with you concerning all these words."

What was the new covenant announced by Jesus on the eve of his death was hardly intended as a new covenant with God, superseding the old. This reconstruction of its meaning seems to have been the peculiar revelation of the Lord to Paul, who viewed Christ's crucifixion and death as an atoning sacrifice, liberating by its grace mankind from bonds of sin which the law, far from snapping, only made more sensible and grievous. This must have been the gist of the special revelation which he had received from Christ as to the inner character of a supper which he already found a ritual observance among believers. The Eucharist of the synoptists is rather a covenant or tie of communion between Jesus and the twelve, such as will cause his life to survive in them after he has been parted from them in the flesh. An older prophet would have slain an animal and drunk its blood in common with his followers, or they would all alike have smeared themselves with it. In the East, even now, one who wishes to create a blood tie between himself and his followers and cement them to himself, makes under his left breast an incision from which they each in turn suck his blood. Such barbarism was alien to the spirit of the Founder, who substitutes bread and wine for his own flesh and blood, only imparting to these his own quality by the declaration that they are himself. He broke the bread not in token of his approaching death, but in order to its equal distribution. Wine he rather chose than water as a surrogate for his actual blood, because it already in Hebrew sacrifices passed as such. "The Hebrews," says Robertson Smith (op. cit. p. 230), "treated it like the blood, pouring it out at the base of the altar." As a red liquid it was a ready symbol of the blood which is the life. It was itself the covenant, for the genitive τοίς διαθήκης in Mark xiv. 24 is epexegetic, and Luke and Paul rightly substitute the nominative. It was, as J. Wellhausen remarks, a better cement than the bread, because through the drinking of it the very blood of Jesus coursed through the veins of the disciples, and that is why more stress is laid on it than on the bread. "To the apostles, as Jews bred and born, the action and words of their master formed a solemn and

\[1\] Das Evangelium Marci, p. 121.
intelligible appeal. It belongs to the same order of ideas that the headship of the Messianic ecclesia in Judea was assigned after the death of Jesus to his eldest brother James, and after him for several generations to the eldest living representative of his family.

To the modern mind it is absurd that an image or symbol should be taken for that which is imaged or symbolized, and that is why the early history of the Eucharist has been so little understood by ecclesiastical writers. And yet other religious, ancient and modern, supply many parallels, which are considered in the article SACRAMENT.

RESERVATION OF THE EUCHARIST

The practice of reserving the sacred elements for the purpose of subsequent reception prevailed in the church from very early times. The Eucharist being the seal of Christian fellowship, it was a natural custom to send portions of the consecrated elements by the hands of the deacons to those who were not present (Justin Martyr, Apol. i. 63). From this it was an easy development, which prevailed before the end of the 2nd century, for churches to send the consecrated Bread to one another as a sign of communion (the eucharistia mentioned by Irenaeus, ap. Eus. H.E. ii. 7. 14), and for the faithful to take it to their own homes and reserve it in arcae or caskets for the purpose of communicating themselves (Tert. ad Uxor. ii. 5, De orat. 19; St Cypr. De lapsis, 132). Being open to objection on grounds both of superstition and of irreverence, these customs were gradually put down by the council of Laodicea in a.D. 360. But some irregular forms of reservation still continued; the prohibition as regards the lay people was not extended, at any rate with any strictness, to the clergy and monks; the Eucharist was still carried on journeys; occasionally it was buried with the dead; and in a few cases the pen was even dipped in the chalice in subscribing important writings. Meanwhile, both in East and West, the general practice has continued unbroken of reserving the Eucharist, in order that the "mass of the presanctified" might take place on certain "aliturgic" days, that the faithful might be able to communicate when there was no celebration, and above all that it might be at hand to meet the needs of the sick and dying. It was reserved in a closed vessel, which took various forms: it was kept in a pyx, a casket, in the Church, or in the House of the Sick, in the West it was kept against the wall behind the altar; in the West, in a locked aumbry in some part of the church, or (as in England and France) in a pyx made in the form of a dove and suspended over the altar.

In the West it has been used in other ways. A portion of the consecrated Bread from one Eucharist, known as the "fermentum," was long made use of in the next, or sent by the bishop to the various churches of his city, no doubt with the object of emphasizing the solidarity and the continuity of "the one Eucharist"; and amongst other customs which prevailed for some centuries, from the 8th onward, were those of giving it to the newly ordained in order that they might communicate themselves, and of burying it in or under the altar-slab of a newly consecrated church. At a later date, apparently early in the

14th century, began the practice of carrying the Eucharist in procession in a monstrance; and at a still later period, apparently after the middle of the 16th century, the practice of Benediction with the reserved sacrament, and that of the "forty hours' exposition," were introduced in the churches of the Roman communion. It should be said, however, that most of these practices met with very considerable opposition both from councils and from theologians and canonists, amongst others from the English canonist William Lyndwood (Provinciale, li. iii. c. 26), on the following grounds amongst others: that the Body of Christ is the food of the soul, that it ought not to be reserved except for the benefit of the sick, and that it ought not to be applied to any other use than that for which it was instituted.

In England, during the religious changes of the 16th century, such of these customs as had already taken root were abolished; and with them the practice of reserving the Eucharist in the churches has come to have died out too. The general feeling on the subject is expressed by the language of the 28th Article, first drafted in 1553, to the effect that "the sacrament of the Lord’s Supper was not by Christ’s ordinance reserved, carried about, lifted up or worshipped," and by the fact that a form of rubrics for this was abolished for the celebration of the Holy Eucharist for the sick in their own homes. The latter practice was in accordance with abundant precedent, but had become very diverse, and not obsolete, for many years before the Reformation. The first Prayer-Book of Edward VI. provided that if there was a celebration in church on the day on which a sick person was to receive the Holy Communion, it should be reserved, and conveyed to the sick man’s house to be administered to him; if not, the curate was to visit the sick person before noon and there celebrate according to a form which is given in the book. At the revision of the Prayer-Book in 1552 all mention of reservation is omitted, and the rubric directs that the communion is to be celebrated in the sick person’s house, according to a new form; and this service has continued, with certain minor changes, down to the present day. That the tendency of opinion in the English Church during the period of the Reformation was against reservation is beyond doubt, and that the practice actually died out would seem to be equally clear. The whole argument of some of the controversial writings of the time, such as Bishop Cooper in Private Mass, depends upon that fact; and when Cardinal du Perron alleged against the English Church the lack of the reserved Eucharist, Bishop Andrews replied that it was otherwise, but that reservation was unnecessary in view of the English form for the Communion of the Sick: "So that reservation needeth not; the intent is had without it" (Answers to Cardinal Perron, &c., p. 19, Library of Anglo-Catholic Theology). It does not follow, however, that a custom which has ceased to exist is of necessity forbidden, nor even that what was rejected by the authorities of the English Church in the 16th century is so explicitly forbidden as to be unlawful under its existing system; and not a few facts have to be taken into account in any investigation of the question. (1) The view has been held that in the Eucharist the elements are only consecrated as regards the particular purpose of reception in the service itself, and that consequently what remains unconsumed may be put to common uses. If this view were held (and it has been held in many places) then once made its appearance in church history, though it has never prevailed, reservation might be open to objection on theological grounds. But such is not the view of the Church of England in her doctrinal standards, and there is an express rubric directing that any that remains of that which was consecrated is not to be carried out of the church, but reverently consumed. There can therefore be no theological obstacle to reservation in the English Church: it is a question of practice only. (2) Nor can it be said that the rubric just referred to is in itself a condemnation of reservation: it is rather directed, as its history proves, against the irreverence which prevailed when it was made; and in fact its wording is based upon that of a pre-Reformation order which coexisted with the practice of reservation (Lyndwood, Provinciale, lib. iii. tit. 26, note 2). (3) Nor can it be said that the words of the 28th Article (see
above) constitute in themselves an express prohibition of reservation, strong as their evidence may be to the practice and feeling of the time. But both are the common property of an earlier age, which saw nothing objectionable in reservation for the sick.

(4) It has indeed been contended (by Bishop Wordsworth of Salisbury) that reservation was not actually, though tacitly, continued under the second Prayer-Book of Edward VI., since that book orders that the curate shall "minister," and not "celebrate," the communion in the sick person's house. But such a tacit sanction on the part of the compilers of the second Prayer-Book is in the highest degree improbable, in view of their known opinions on the subject; and an examination of contemporary writings hardly justifies the contention that the two words are so carefully used as the argument would demand. Anyhow, as the bishop notes, this could not be the case with the Prayer-Book of 1661, where the word is "celebrate." (5) The Elizabethan Act of Uniformity contained a provision that at the universities the public services, with the exception of the Eucharist, might be in a language other than English; and in 1560 there appeared a Latin version of the Prayer-Book, issued under royal authority, in which there was a rubric prefixed to the Order for the Communion of the Sick, based on that in the first Prayer-Book of Edward VI. (see above), and providing that the Eucharist should be reserved for the sick person if there had been a celebration on the same day. But although the book in question was issued under letters patent, it is not really a translation of the Elizabethan book at all, but simply a reshaping of Aless's clever and inaccurate translation of Edward VI.'s first book. In the rubric in question words are altered here and there in a way which shows that its reappearance can hardly be a mere printer's error; but in any case its importance is very slight, for the Act of Uniformity specially provides that the English service alone is to be used for the Eucharist.

(6) It has been pointed out that reservation for the sick prevails in the Scottish Episcopal Church, the doctrinal standards of which correspond with those of the Church of England. But it must be remembered that the Scottish Episcopal Church has an additional order of its own for the Holy Communion, and consequently its clergy are not restricted to the services in the Book of Common Prayer. Moreover, the practice of reservation which has prevailed in Scotland for over 150 years would appear to have arisen out of the special circumstances of that church during the 18th century, and not to have prevailed continuously from earlier times. (7) Certain of the divines who took part in the framing of the Prayer-Book of 1661 seem to speak of the practice as though it actually prevailed in their day. But Bishop Sparrow's words on the subject (Rationale, p. 340) are not free from difficulty on any hypothesis, and Thorndike (Works, v. 578, Library of Anglo-Catholic Theology) writes in such a style that it is often hard to tell whether he is describing the actual practice of his day or that which in his view it ought to be. (8) There appears to be more evidence than is commonly supposed to show that the practice analogous to that of the 4th of May, when the sick man's day has been adopted from time to time in England, viz. that of conveying the sacred elements to the houses of the sick during, or directly after, the celebration in church. And in 1899 this practice received the sanction of Dr Westcott, then bishop of Durham. (9) On the other hand, the words of the oath taken by the clergy under the 36th of the Canons of 1604 are to the effect that they will use the form prescribed in the Prayer-Book and none other, except so far as shall be otherwise ordered by lawful authority; and the Prayer-Book does not even mention the reservation of the Eucharist, whilst the Articles mention it only in the way of depreciation.

The matter has become one of no little practical importance owing to modern developments of English Church life. On the one hand, it is widely felt that neither the form for the Communion of the Sick, nor yet the teaching with regard to spiritual communion in the third rubric of that service, is sufficient to meet all the cases that arise or may arise. On the other hand, it is probable that in many cases the desire for reservation has arisen, in part at least, from a wish for some-thing analogous to the Roman Catholic customs of exposition and benediction; and the chief objection to any formal practice of reservation, on the part of many who otherwise would not be opposed to it, is doubtless to be found in this fact. But however that may be, the practice of reservation of the Eucharist, either in the open church or in private, has become not uncommon in recent days.

The question of the legality of reservation was brought before the two archbishops in 1899, under circumstances analogous to those in the Lambeth Hearing on Insec (q.v.). The parties concerned were three clergymen, who appealed from the direction of their respective diocesan bishops, the bishops of St Albans and Peterborough, and the archbishop of York: in the two former cases the archbishop (Temple) of Canterbury was the principal and the archbishop of York (Maclagan) the assessor, whilst in the latter case the functions were reversed. The hearing extended from 17th to 20th July; counsel were heard on both sides, evidence was given in support of the appeals by two of the clergy concerned and by several other witnesses, lay and clerical, and the whole matter was gone into with no little fulness. The archbishops gave their decision on the 1st of May 1900 in two separate judgments, to the effect that, in Dr Temple's words, "the Church of England does not at present allow reservation in any form, and that those who think that it ought to be allowed, though perfectly justified in endeavouring to get the proper authorities to alter the law, are not justified in practising reservation until the law has been so altered." The archbishop of York also laid stress upon the fact that the difficulties in the way of the communion of the sick, when they are really ready for communion, are not so great as has sometimes been suggested.

EUCHRE, a game of cards. The name is supposed by some to be a corruption of évêché, to which game it bears some resemblance; others connect it with the Ger. Juches, a joke, owing to the presence in the pack, or "deck," of a special card called the joke; but neither derivation is quite satisfactory. The "decks" contain 48 cards, all cards between the seven and ace being rejected from the pack. Sometimes the sevens and eights are rejected as well. The "joker" is the best card, i.e. the highest trump. Second in value is the "right bower" (from Dutch boer, farmer, the name of the knave), or knave of trumps; third is the "left bower," the knave of the other suit of the same colour as the right bower, also a trump: then follow ace, king, queen, &c., in order. Thus if spades are trumps the order is (1) the joker, (2) knave of spades, (3) knave of clubs, (4) ace of spades, &c. The joker, however, is not always used. When it is, the game is called "railroad" euchre. In suits not trumps the cards rank as at whist. Euchre can be played by two, three or four persons. In the cut for deal, the highest card deals, the knave being the highest and the ace the next best card. The dealer gives five cards to each person, two each and then three each, or vice versa: when all have received their cards the next card in the pack is turned up for trump, "one-hand euchre."—If the non-dealer, who looks at his cards first, is satisfied, he says "I order it up," i.e. he elects to play with his hand as it stands and with the trump suit as turned up. The dealer then rejects one card, which is put face downwards at the bottom of the pack, and takes the trump suit. If, however, the non-dealer is not satisfied with his original hand, he says "I pass," on which the dealer can either "adopt," or "take it up," the suit turned up, and proceed as before, or he can pass, turning down the trump card to show that he passes. If both players pass, the non-dealer can make any other suit trumps, by saying "I make it spades," for example, or he can pass again, when the dealer can either make another suit trumps or pass. If both players pass, the hand is at an end. If the trump card is black and either player makes the other black suit trumps, he "makes it next," if he makes
EUCHEN—EUCLASE

A red suit trumps he "crosses the suit"; the same applies to trumps in a red suit, mutatis mutandis. The non-dealer leads; the dealer must follow suit if he can, but he need not win the trick, nor need he trump if unable to follow suit. The left bower counts as a trump, and a trump must be led if led. The right bower trumps; the player who orders up or adopts makes five tricks (a "march") he scores two points; if four or three tricks, one point; if he makes less than three tricks, he is "euchred" and the other player scores two. A right bower wins a trump suit, a game is won, unless the player who leads a trump fails to score at all, when the winner counts two for that game. This is called a "lurch." When a player wins three tricks, he is said to win the "point." The rubber points are two, as at whist. All three games are played out, even if points are not made. It is sometimes agreed that if a score is "lapped," i.e., if the winner makes more than five points in a game, the surplus may be carried over to the next game. The leader should be cautious about ordering up, since the dealer will probably hold one trump in order to "stop the score" and win the trick. In ordinary Euchre, the dealer should take it, in case the dealer should take up the trump. If the leader "turns it down," it is not wise to "make it," unless the odds on getting the point against one trump are two to one. With good cards and a trick, the dealer should go into the hand and make five tricks. The player on the dealer's right wins the game, even though the dealer should have led at the other end. The game is won, if the dealer has four cards to his two, and if the score is not made, to have a bower in that suit. The dealer, if he adopts, should discard a singleton, unless it is an ace. If the dealer's score is three, only a very strong hand justifies one in ordering up. It is generally considered good play to discard a singleton, in order to unguard another suit. With one's adversary at four, the trump should be adopted even on a light hand.

Three-handed (cut-throat) Euchre.—In this form of the game the players are in pairs, playing against each other, all the tricks being played on the partner on the left. The player who orders up, takes up, or makes, plays against the other two; if he is euchred his adversary scores two each; by other laws he is set back two points, and should have his partner on the hand when the partner scores seven points. The procedure is the same as in two-handed euchre.

Four-handed Euchre.—The game is played with partners, cutting and sitting, and the deal passing, as at whist. If the first player passes, the second may pass, or the third may make. If the first player makes, the partner on his right must play. If the first player has ordered up, his partner may say "I take it from you," which means that he will play alone against the two adversaries, the first player's cards being put face downwards on the table, and not being used in the play. At euchre, the player can partner taking no part in the play. Even if the first hand plays alone, the third may take it from him. Similarly the dealer may take it from the second hand, but the second hand cannot take it from the dealer. If, however, it is the first player who passes, the first, second, and third must make, naming the suit he makes. The third hand can "take it" from the first, or play alone in the suit made by the first, the dealer having a similar right over his own partner. If all four pass, again, the first is in the game. To discard a singleton and not to guard an enemy's suit is not good policy.

If a lone player makes five tricks in one score, he scores four if: three tricks, one; he fails to make three tricks the opponents score four. It is not wise for the first hand to order up unless the chances are very good. It is good policy to play trumps through a hand that assists, bad policy to do so when the leader adopts. Tramps should be led to a partner who has ordered up or made it. It is sometimes considered wise for the first hand to "throw the other trumps from the trump suit" to their benefit, in order to prevent their playing from a side from playing alone, if their score is only one or two and the leader's is four. This right is lost if a player reminds his partner, after the trump card has been turned, that they are at the point of bridging. If the partner has scores that are not altered at the other end, the dealer should turn down, unless very strong. The second hand should not assist unless really strong, except when the point of four-all or four-love. When led through, it is generally wise, eiteria paribus, to head the suit, and not to guard. If the dealer is cut off, or with one trump if a bower is turned up. At four-all and four-love he should adopt on a weaker hand. Also, being fourth player, he can make it on a weaker hand than other players. If the dealer's partner assists, the dealer should adopt a partner, as the other player has the best card in the trump suit, not in the bidder's hand: if it is among the undone cards, which is ascertained by the fact that no one else holds it, he can call for the next best and so on. The partners then play against the other four.

Eucken, Rudolf Christoph (1846— ) A German philosopher, was born on the 5th of January 1846 at Aurich in East Frisia. His father died when he was a child, and he was brought up by his mother, a woman of considerable ability. He was educated at Aurich, where one of his teachers was the philosopher Wilhelm Reuter, whose influence was the dominating factor in the development of his thought. Passing to the university of Göttingen he took his degree in classical philology and ancient history, but the best of his mind was definitely towards the philosophical side of theology. Subsequently he studied in Berlin, especially under Trendelenburg, whose ethical tendencies and historical treatment of philosophy greatly attracted him. From 1871 to 1874 Eucken taught philosophy at Basel, and in 1874 became professor of philosophy at the university of Jena. In 1908 he was awarded the Nobel prize for literature. Eucken's philosophical work is partly historical and partly constructive, the former side being predominant in his earlier, the latter in his later works. Their most striking feature is the close organic relationship between the two parts. The aim of the historical works is to show the necessary connexion between philosophical concepts and the age to which they belong; the same idea is that of a constructive philosophy of life, the development of a new culture, not mere intellectualism, but the application of a vital religious inspiration to the practical problems of society. This practical idealism Eucken described by the term "Activism." In accordance with this principle, Eucken has given considerable attention to social and educational problems.

His chief works are:—Die Methode der aristotelischen Forschung (1872); the important historical study on the history of concepts, Die Grundsäfie der Gegenwart (1878; Eng. trans. by M. Stuart R. P. Wheatley); 1880; 3rd ed. under the title Geltende Strömungen der Philosophie der Gegenwart, 1904; 4th ed., 1909); Geschichte der philos. Terminologie (1879); Prolegomena zu Forschungen über die Einheit des Geisteslebens (1885); Beiträge zur Geschichte der neueren Philosophie (1892); Die Philosophie der Gegenwart: Ursachen der grossen Denker (1899; 7th ed., 1907; Eng. trans., W. Heugh and Boyce Gibson, The Problem of Human Life, 1909); Der Wahrheitsgehalt der Religion (1901); 2nd ed., 1905; Thomas von Aquin (1902); Die Philosophie der Lebensanschauungen der grossen Denker (1899; 7th ed., 1907; Eng. trans., W. Heugh and Boyce Gibson, The Problem of Human Life, 1909); Der Kampf um einen geistigen Lebensinhalt (1896, 1907); Grundlinien einer neuen Lebensanschauung (1907); Einführung in die Philosophie des Geisteslebens (1908; Eng. trans., The Life of the Spirit of L. Pogson, 1900; Crown Theological Library); Der Sinn und Wert des Lebens (1908; Eng. trans., 1909); Hauptprobleme der Religionsphilosophie der Gegenwart (1907). The following of Eucken's works have also been translated into English:—Liberty in Teaching in the German Universities (1897); Are the Germans still a great people (1899); The Anthropology of George Santayana (1898); Progress of Philos. in the 19th Century (1899); The Finnic Question (1899); The Present Status of Religion in Germany (1901). See W. R. Boyce Gibson, Rudolf Eucken's Philosophical Development, 1907; and 9, 1908; 2nd ed. Play (a lone hand) historian's work, Falkenberg's Hist. of Philos. (Eng. trans., 1895, index); also H. Pflömmel, R. Eucken's Philosophie mit ihren philosophischem Grundzügen dargestellt (1903); O. Siebert, R. Eucken's Welt- und Lebensanschauung (1909).

EUCLASE, a very rare mineral, occasionally cut as a gem-stone for the cabinet. It bears some relation to beryl in that it is a silicate containing beryllium and aluminium, but hydrogen is also present, and the analyses of euclase lead to the formula HBeAl₂SiO₆ or Be(OH)₂SiO₆. It crystallizes in the monoclinic system, the crystals being generally of prismatic habit, striated vertically, and terminated by acute pyramids. Cleavage is perfect, parallel to the clinopinacoid, and this suggested to R. J. Haüy the name euclase, from the Greek eu, easily, and skardos, fracture. The ready cleavage renders the stone fragile with a tendency to chip, and thus detracts from its use for personal ornament. The colour is generally pale-blue or green, though sometimes the mineral is colourless. When cut it resembles

Bid Euchre.—This game resembles "Napoleon" (q.v.). It is played with a euchre deck, each player receiving five cards, the others being left face-downwards. Each player "bids," i.e. declares and makes a certain number of tricks, the highest bidder leading and his first card being a trump. When six play, the player who bids highest may either lead the first card himself or order the player who has the best card in the trump suit, not in the bidder's hand: if it is among the undone cards, which is ascertained by the fact that no one else holds it, he calls for the next best and so on. The partners then play against the other four.
EUCLID

879
certain kinds of beryl (aquamarine) and topaz, from which it may be distinguished by its specific gravity (3:1). Its hardness (7:5) is rather less than that of topaz. Euclides occurs with topaz at Boa Vista, near Ouro Preto (Villa Rica) in the province of Minas Geraes, Brazil. It is found also with topaz and chrysoberyl in the gold-bearing gravels of the R. Sanarka in the South Urals; and it is met with as a rarity in the mica-schist of the Rauris in the Austrian Alps.

EUCLID [EUCLIDES], of Megara, founder of the Megarian (also called the eristic or dialectic) school of philosophy, was born c. 450 b.C., probably at Megara, though Gela in Sicily has also been named as his birthplace (Diogenes Laërtius ii. 106), and died in 374. He was one of the most devoted of the disciples of Socrates. Aulus Gellius (vi. 10) states that, when a decree was passing forbidding the Megarians to enter Athens, he regularly visited his master by night in the disguise of a woman; and he was one of the little band of intimate friends who listened to the last discourse. He withdrew subsequently with a number of fellow disciples to Megara, and it has been conjectured, though there is no direct evidence, that this was the period of Plato's residence in Megara, of which indications appear in the Theaetetus. He is said to have written six dialogues, of which only the titles have been preserved. For his doctrine (a combination of the principles of Parmenides and Socrates) see MEGARIAN SCHOOL.

EUCLID, Greek mathematician of the 3rd century B.C.; we are ignorant not only of the dates of his birth and death, but also of his parentage, his teachers, and the residence of his early years. In some of the editions of his works he is called Megenas, as if he had been born at Megara in Greece, a mistake which arose from confounding him with another Euclid, a disciple of Socrates. Proclus (A.D. 412–485), the authority for most of our information regarding Euclid, states in his commentary on the first book of the Elements that Euclid lived in the time of Ptolemy I., king of Egypt, who reigned from 323 to 285 b.C., that he was younger than the associates of Plato, but older than Eratosthenes (276–196 b.C.) and Archimedes (287–212 B.C.). Euclid is said to have founded the mathematical school of Alexandria, which was at that time becoming a centre, not only of commerce, but of learning and research, and for this service to the cause of exact science he would have deserved commendation, even if his writings had not secured him a worthy title to fame. Proclus preserves a reply made by Euclid to King Ptolemy, who asked whether he could not learn geometry more easily than by studying the Elements—"There is no royal road to geometry." Pappus of Alexandria, in his Mathematical Collection, says that Euclid was a man of mild and inoffensive temperament, unpretending, and kind to all genuine students of mathematics. This being all that is known of the life and character of Euclid, it only remains therefore to speak of his works.

Among those which have come down to us the most remarkable is the Elements (Στοιχεῖα) (see GEOMETRY). They consist of thirteen books; two more are frequently added, but there is reason to believe that they are the work of a later mathematician, Hippax of Alexandria. Euclid's title has often been mooted, to what extent Euclid, in his Elements, is a discoverer or a compiler. To this question no entirely satisfactory answer can be given, for scarcely any of the writings of earlier geometers have come down to our times. We are mainly dependent on Pappus and Proclus for the scanty notices we have of Euclid's predecessors, and of the problems which engaged their attention; for the solution of problems, and not the discovery of theorems, would seem to have been their principal object. From these authors we learn that the property of the right-angled triangle had been found out, the principles of geometrical analysis laid down, the restriction of constructions in plane geometry to the straight line and the circle agreed upon, the doctrine of proportion, for both commensurables and incommensurables, as well as loci, plane and solid, and some of the properties of the conic sections investigated, the five regular solids (often called the Platonic bodies) and the relation between the volume of a cone or pyramid and that of its circumscribed cylinder or prism discovered. Elementary works had been written, and the famous problem of the duplication of the cube reduced to the determination of two mean proportionals between two given straight lines. Notwithstanding this amount of discovery, and all that it implied, Euclid must have made a great advance beyond his predecessors (we are told that "he arranged the discoveries of Eudoxus, perfected those of Theaetetus, and reduced to invariable demonstration many things that had previously been more loosely proved "), for his Elements supplanted all similar treatises, and, as Apollonius received the title of "the great geometer," so Euclid has come down to later ages as "the elementator."

For the past two centuries parts of the Elements, notably the first six books, have been used as an introduction to geometry. Though they are now to some extent superseded in most countries, their long retention is a proof that they were, at any rate, not unsuitable for such a purpose. They are, speaking generally, not too difficult for novices in the science; the demonstrations are rigorous, ingenious and often elegant; the mixture of problems and theorems gives perhaps some variety, and makes their study less monotonous; and, if regard be had merely to the mathematical properties of space as distinguished from the graphical, hardly any cardinal geometrical truths have been omitted. With these excellences are combined a good many defects, some of them inevitable to a system based on a very few axioms and postulates. Thus the arrangement of the propositions seems arbitrary; associated theorems and problems are not grouped together; the classification, in short, is imperfect. Other objections, not to mention minor blemishes, are the prolixity of the style, arising partly from a defective nomenclature, the treatment of parallels depending on an axiom which is not axiomatic, and the sparing use of superposition as a method of proof.

Of the thirty-three ancient books subservient to geometrical analysis, Pappus enumerates first the Data (Δοξομέα) of Euclid. He says it contained 90 propositions, the scope of which he describes; it now consists of 95. It is not easy to explain this discrepancy, unless we suppose that some of the propositions, as they existed in the time of Pappus, have since been split into two or that what were once scholia have since been erected into propositions. The object of the Data is to show that when certain things—lines, angles, spaces, ratios, &c.—are given by hypothesis, certain other things are given, that is, are determinable. The book, as we are expressly told, and as we may gather from its contents, was intended for the investigation of problems; and it has been conjectured that Euclid must have extended the method of the Data to the investigation of theorems. What prompts this conjecture is the similarity between the analysis of a theorem and the method, common enough in the Elements, of reductio ad absurdum—the one setting out from the supposition that the theorem is true, the other from the supposition that it is false, thence in both cases deducing a chain of consequences which ends in a conclusion previously known to be true or false. The Introduction to Harmony (Εἰσαγωγὴ Ἀρμονίας), and the Section of the Scale (Κατασκευὴ καθών), treat of music. There is good reason for believing that one at any rate, and probably both, of these books are lost. The second book of the Data, as it is usually called, is an account of the method of making of them by any writer previous to Ptolemy (A.D. 140), or by Ptolemy himself, and in no ancient codex are they ascribed to Euclid.

The Phaenomena (Φαινόμενα) contains an exposition of the appearances produced by the motion attributed to the celestial sphere. Pappus, in the few remarks preface to his sixth book, complains of the faults, both of omission and commission, of writers on astronomy, and cites as an example of the former the second theorem of Euclid's Phaenomena, whence, and from the interpolation of other proofs, David Gregory infers that this treatise is corrupt.

The Optics and Catoptrics (Οπτική, Κατοπτρική) are ascribed to Euclid by Ptolemy, and by Marinus in his preface to the Data, but no mention is made of them by Pappus. This latter circumstance, taken in connexion with the fact that two of the propositions in the sixth book of the Mathematical Collection prove the
some things as three in the Optics, is one of the reasons given by Gregory for deeming that work spurious. Several other reasons will be found in Gregory's preface to his edition of Euclid's works.

In some editions of Euclid's works there is given a book that was not written by Euclid, the Divisions of Superficies, which is a book of a few propositions, showing how a sphere may be divided into a given ratio of cones, quadrilaterals and pentagons. This was supposed by John Dee of London, who transcribed or translated it, and entrusted it for publication to his friend Federico Commandino of Urbino, to be the treatise of Euclid referred to by Proclus as τὸ περὶ διασφάλων βιβλίον. Dee mentions that, in the copy from which he wrote, the book was ascribed to Machomet of Bagdad, and adduces two or three reasons for thinking it to be Euclid's. This opinion, however, he does not seem to have held very strongly, nor does it appear that it was adopted by Commandino. The book does not exist in Greek.

The fragment, in Latin, De levi et ponderoso, which is of no value, and was printed at the end of Gregory's edition only in order that nothing might be left out, is mentioned neither by Pappus nor Proclus, and occurs first in Bartholomew Zamberti's edition of 1537. There is no reason for supposing it to be genuine.

The following works attributed to Euclid are now extant:

1. Three books on Parisms (Περὶ τῶν πορωθάτων) are mentioned both by Pappus and Proclus, and the former gives an abstract of them, with the lemmas assumed. (See Ptolemy.)

2. Two books are mentioned, named Τῶρως πρὸς ἐπικεφαλίαν, which is rendered Locorum ad supericiem by Commandino, and supposed to contain metrics. These books were subsevient to the analysis of loci, but the four lemmas which refer to them and which occur at the end of the seventh book of the Mathematical Collection, throw very little light on their contents. R. Simson's opinion was that they were treated of curves of double curvature, and he intended at one time to write a treatise on the subject. (See Trail's Life of Dr Simson.)

3. Pappus says that Euclid wrote four books on the Conic Sections (Βιβλία τῶν καυκίων), which Apollonius amplified, and to which he added four more. It is known that, in the time of Euclid, the parabola was considered as the section of a right-angled cone, the ellipse that of an acute-angled cone, the hyperbola that of an obtuse-angled cone, and that Apollonius was the first who showed that the three sections could be derived from any cone. There is good ground therefore for supposing that the first four books of Apollonius's Conics, which are still extant, resemble Euclid's Conics even less than Euclid's Elements do those of Eudoxus and Theaetetus.

4. A book on Fallacies (Περὶ γεγοςίων) is mentioned by Proclus, who says that Euclid wrote it for the purpose of exercising beginners in the detection of errors in reasoning.

This notice of Euclid would be incomplete without some account of the earliest and the most important editions of his works. Passing over the commentators of the Alexandrian school, the first European translator of any part of Euclid is Boëtius (500), author of the De consolatione philosophiae. His Euclidis Megarensis geometriae libri duo contain nearly all the definitions of the first three books of the Elements, and all the propositions of these books which are added to the Elements in the commentaries of Proclus and Theon. The enunciations, with diagrams but no proofs, are given of most of the propositions in the first, second and fourth books, and a few from the third. Some centuries afterwards, Euclid was translated into Arabic, and the first of the commentaries that are extant, and which are perhaps one of the three books of the Elements by Nasir Al-Din Al-Tusi (13th century), which appeared at Rome in 1504.

The first printed edition of Euclid was a translation of the first thirteen books of the Elements from the Arabic, made, it is supposed, by Adelard of Bath (12th century), with the comments of Campanus of Novara. It appeared at Venice in 1482, printed by Erhard Ratdolt, and dedicated to the doge Giovanni Mocenigo. This edition was perhaps very soon perceived to be an extant and often foolish, propositions are sometimes omitted, sometimes joined together, useless cases are interpolated, and now and then Euclid's order changed.

The first printed translation from the Greek is that of Bartholomew Zamberti, which appeared at Venice in 1508. Its contents will be seen from the title: Euclidis Megarensis philosophi platonici Mathematicarum disciplinarum Janitoris: Habent in hac volumine quindecim ad mathematicam substantiam aspirant: elementos libros xiv &c. de Thoenis insynis mathematicis... Quidquid ad juncta. Deputatum scilicet Euclidis voluminis xii a expisit Hyspi.
Demetrius, and conquered a great part of western India. According to Apollodorus of Artemis, the historian of the Parthians, he ruled over 1000 towns (Strabo xvi. 688); transferred to Diadotus of Bactria in Justin 41, 6); and the extent of his kingdom over Bactria, Sogdiana (Bokhara), Drangiana (Siijistan), Kabul and the western Punjab is confirmed by numerous coins. On these coins, which bear Greek and Indian legends (in Khorshešt writing, cf. BACTRIA), he is called “the great King Eucratides.” On one his portrait and name are associated on the reverse with those of Heliocles and Laodice; Heliocles was probably his son, and the coin may have been struck to celebrate his marriage with Laodice, who seems to have been a Seleucid princess. In Bactria Eucratides founded a Greek city, Eucratedia (Strabo xi. 376, Ptolem. vi. 11. 8). On his return from India Eucratides was (about 150 B.C.) murdered by his son, whom he had made co-regent (Justin 41, 6). This son is probably the Heliocles just mentioned, who on his coins calls himself “the Just” (σάλλων Ἡλίοκλης δικαίος). In his time the Graeco-Bactrian kingdom lost the countries north of the Hindu Kush. Mongolian tribes, the Yue-chi of the Chinese, called by the Greeks Scythians, by the Indians Saka, among which the Yuezhi are the most conspicuous, pressed into Bactria in 150 B.C. and conquered Eucratides in 139. Meanwhile the Parthian kings Mithradates I. and Phraates II. conquered the provinces in the west of the Hindu Kush (Justin 41, 6, 8); for a short time Mithradates I. extended his dominion to the borders of India (Diod. 33. 18, Orosius v. 4. 16). When Antiochus VII. Sidetes tried once more to restore the Seleucid dominion in 139, Phraates allied himself with the Scythians (Justin 42, 1. 1); but after his decisive victory in 129 he was attacked by them and fell in the battle. The changed state of affairs is shown by the numerous coins of Heliocles; while his predecessors maintained the Attic standard, which had been dominant throughout the Greek east, he on his later coins passes over to a native silver standard, and his bronze coins become quite barbarous. Besides his coins we possess coins of many other Greek kings of these times, most of whom take the epithet of “invincible” (διόρρης) and “saviour” (σωτήρ). They are records of a desperate struggle of the Greeks to maintain their nationality and independence in the Far East; one usurper after the other rose to fight for the rescue of the kingdom. But these internal wars only accelerated the destruction; about 120 B.C. almost the whole of eastern Iran was in the hands either of a Parthian dynasty or of the Mongol invaders, who are now called Indo-Scythians. Only in the Kabul valley and western India the Greeks maintained themselves about two generations longer (see MENANDER).

EUDAEMONISM (from Gr. εὐδαιμονία, literally the state of being under the protection of a benign spirit, a “good genius”), in ethics, the name applied to theories of morality which find the chief good of man in some form of happiness. The term Eudaemonia has been taken in a large number of senses, with consequent variations in the meaning of Eudaemonism. To Plato the “happiness” of all the members of a state, each according to his own capacity, was the final end of political development. Aristotle, as usual, adopted “eudaemonia” as the term which in popular language most nearly represented his idea of happiness, using it throughout his ethical treatise. Not only the meaning but he greatly extended the content of the word, until the popular idea was practically lost: if a man is to be called εὐδαιμων, he must have all his powers performing their functions freely in accordance with virtue, as well as a reasonabledegree of material well-being; the highest conceivable good of man is the life of contemplation. Aristotle further held that the good man in achieving virtue must experience pleasure (hedon), which is, therefore, not the same as, but the sequel to or concomitant of eudaemonia. Subsequent thinkers have to a greater or less degree identified the two ideas, and much confusion has resulted. Among the ancients the Epicureans expressed all eudaemonia in terms of pleasure. On the other hand attempts have been made to separate hedonism, as the search for a continuous series of physical pleasures, from eudaemonism, a condition of enduring mental satisfaction. Such a distinction involves the assumptions that bodily pleasures are generally different from mental ones, and that there is in practice a clearly marked dividing line,—both of which hypotheses are frequently denied. Among modern writers, James Seth (Ethical Princ., 1894) resumes Aristotle’s position, and places Eudaemonism as the mean between the Ethics of Sensibility (hedonism) and the Ethics of Rationality, each of which overlooks the complex character of human life. The fundamental difficulty which confronts those who would distinguish between pleasure and eudaemonia is that all pleasure is ultimately a mental phenomenon, whether it be roused by food, music, doing a moral act or committing a theft. There is a marked disposition on the part of critics of hedonism to confuse “pleasure” with animal pleasure or “passion,”—in other words, with a pleasure phenomenon in which the predominant feature is entire lack of self-control, whereas the word “pleasure” has strictly no such connotation. Pleasure is strictly nothing more than the state of being pleased, and hedonism the theory that man’s chief good consists in acting in such a way as to bring about a continuous succession of such states. That they are in some cases produced by physical or sensory stimuli does not constitute them irrational, and it is purely arbitrary to confine the word pleasure to those cases in which such stimuli are the proximate causes. The value of the term Eudaemonism as an antithesis to Hedonism is thus very questionable.

EUDOCIA AUGUSTA (c. 401–c. 460), the wife of Theodosius II., East Roman emperor, was born in Athens, the daughter of the sophist Leontius, from whom she received a thorough training in literature and rhetoric. Deprived of her small patrimony by her brothers’ capacity, she betook herself to Constantinople to obtain redress at court. Her accomplishments attracted Theodosius’ sister Pulcheria, who took her into her retinue and destined her to be the emperor’s wife. After receiving baptism and discarding her former name, Athenais, for that of Aelia Licinia Eudocia, she was married to Theodosius in 411; two years later, after the birth of a daughter, she received the title August. The new empress repaid her brothers by making them consuls and prefects, and used her large influence at court to protect pagans and Jews. In 438–439 she made an ostentatious pilgrimage to Jerusalem, where she was received with great honors, and gave various alms; during her stay at Antioch she harbaged the senate in Hellenic style and distributed funds for the repair of its buildings. On her return her position was undermined by the jealousy of Pulcheria and the groundless suspicion of an intrigue with her protégé Paulinus, the master of the offices. After the latter’s execution (440) she retired to Jerusalem, where she was made responsible for the murder of an officer sent to kill two of her followers and stripped of her revenues. Nevertheless she retained great influence; although involved in the revolt of the Syrian monophysites (453), she was ultimately reconciled to Pulcheria and readmitted into the orthodox church. She died at Jerusalem about 460, after devoting her last years to literature. Among her works were a paraphrase of the Octateuch in hexameters, a paraphrase of the books of Daniel and Zechariah, a poem on St. Cyrilian and on her husband’s Persian victories. A Passion History compiled out of Homeric verses, which Zonaras attributed to Eudocia, is perhaps of different authorship.

See W. Wiegand, Eudokia (Worms, 1871); F. Gregorovius, Athens (Leipzig, 1884); J. Friederichs, Byzantiner (Paris, 1869), pp. 25–49; also EUDOCIA. On her works cf. A. Ludwig, Eudociae Augusti carminum reliquiae (Konigsberg, 1893).

EUDOCIA MACREMBOLITISSA (c. 1021–1096), daughter of John Macrembolites, was the wife of the Byzantine emperor Constantine X., and after his death (1067) of Romanus IV. She had sworn to her first husband on his deathbed not to marry again, and had even imprisoned and exiled Romanus, who was suspected of aspiring to the throne. Perceiving, however, that she was not able unaided to avert the invasions which threatened the eastern frontier of the empire, she revoked her oath, married Romanus, and with his assistance dispelled the impending danger. She did not live very happily with her new husband, who was warlike and self-willed, and when he was taken prisoner by the Turks (1071) she was compelled to vacate the throne in
favour of her son Michael and retire to a convent, where she died. The dictionary of mythology entitled Ινοψι ("Collection of Violets"), which formerly used to be ascribed to her, was not compiled till 1543 (Constantine Palaeokappa).

See J. Flach, Die Kaiserin Eudoxia Makedonobolissa (Tübingen, 1876); P. Pulch, De Eudoxiae quod fertur Violatoria (Strassburg, 1880); and in Hermes, xxvi. (1882), p. 177 ff.

EUDOXIA LOPUKHINA (1660–1731), tsarsitsa, first consort of Peter the Great, was the daughter of the boyarin Theodore Lopukhin. Peter, then a youth of seventeen, married her on the 27th of January 1689 at the command of his mother, who hoped to wean him from the wicked ways of the German suburb of Moscow by wedding him betimes to a lady who was as pious as she was beautiful. The marriage was in every way unfortunate. Accustomed from her infancy to the monastic seclusion of the terem, or women's quarter, Eudoxia's mental horizon did not extend much beyond her embroidery-frame or her illuminated service-book. From the first her society bored Peter, unaccountably, and after the birth of their second, short-lived son Alexander, he practically deserted her. In 1698 she was unceremoniously sent off to the Pokrovsky monastery at Suzdal for refusing to consent to a divorce, though it was not till June 1699 that she disappeared from the world beneath the hood of sister Elena. In the monastery, however, she was held in high honour by the archimandrite; the nuns persisted in regarding her as the lawful empress; and she was permitted an extraordinary degree of latitude, unknown to Peter, who dragged her from her enforced retreat in 1718 on a charge of adultery. As the evidence was collected by Peter's creatures, it is very doubtful whether Eudoxia was guilty, though she was compelled to make a public confession. She was then divorced and consigned to the remote monastery of Ladoga. Here she remained for ten years till the accession of her grandson, Peter II., when the reactionary's proposed to appoint her regent. She was escorted with great ceremony to Moscow in 1728 to the immense delight of the people attired in the splendid, old-fashioned robes of a tsarsitsa; but years of rigid seclusion had dulled her wits, and her best efforts to convince themselves that a convent was a much more suitable place for her than a throne. An allowance of 60,000 roubles a year was accordingly assigned to her, and she disappeared again in a monastery at Moscow, where she died in 1731.

See Robert Nisbet Bain, Pupils of Peter the Great (London, 1895), chaps. ii. and iv.; and The First Romancers (London, 1908), chaps. viii. and xli.

EUDOXUS, of Cnido, Greek savant, flourished about the middle of the 4th century B.C. It is chiefly as an astronomer that his name has come down to us (see Astronomy and Zoönic). From a life by Diogenes Laërtius, we learn that he studied at Athens under Plato, but, being dismissed, passed over into Egypt, where he remained for sixteen months with the priests of Heliopolis. He then taught physics in Cyzicus and the Propontis, and subsequently, accompanied by a number of pupils, went to Athens. Towards the end of his life he returned to his native place, where he died. Strabo states that he discovered that the solar year is longer than 365 days by 6 hours; Vitruvius that he invented a sun-dial. The Phaenoruma of Aratus is a poetical account of the astronomical observations of Eudoxus. Several works have been attributed to him, but they are all lost; some fragments are preserved in the extant Τῶν Άρσων καὶ Εὐδοξίου τάξιν καὶ τὴν τιμὴν τοῦ τοιούτου εὐγενοῦς θεοῦ τρίτον τοῦ Αρατοῦ Hipparchus (ed. C. Mamiitis, 1894). According to Aristotle (Ethics θ., 2), Eudoxus held that pleasure was the chief good, because (1) all beings sought it and endeavoured to possess it by contrary, pain; (2) it is an end in itself, not the means to a better good. Aristotle, who speaks highly of the sincerity of Eudoxus's convictions, while giving a qualified approval to his arguments, considers him wrong in not distinguishing the different kinds of pleasure and in making pleasure the summum bonum.

See J. A. Letronne, Sur les écrivains des travaux d'Eudoxie de Cnide, d'après L. Ideler (1841); G. V. Schiaparelli, Le Sfere omocentriche di Eudossio (Milan, 1876); H. Martinez in Académie des inscriptions, 3rd of October, 1879; article in Eshch and Grubee's Allgemeine Enzyklopädie.

EUDOXUS, of Cyzicus, Greek navigator, flourished about 130 B.C. He was employed by Ptolemy Euergetes, who sent out a fleet under him to explore the Arabian Sea. After two successful voyages, Eudoxus left the Egyptian service, and proceeded to Cadiz with the object of fitting out an expedition for the purpose of African discovery; and we learn from Strabo, who utilized the results of his observations, that the veteran explorer made at least two voyages southward along the coast of Africa. There is a good account of Eudoxus in E. H. Bunbury, History of Ancient Geography, ii. (1879); see also P. Gaffarel, Eudoxe de Cysique (1873).

EUGENE OF SAVOY [FRANÇOIS EUGÈNE], PRINCE (1663–1736), fifth son of Prince Eugene Maurice of Savoy-Carignano, count of Soissons, and of Olympia Mancini, niece of Cardinal Mazarin, was born at Paris on the 18th of October 1663. Originally destined for the church, Eugene was known at court as the petit abbé, but his own predilection was strongly for the army. His mother, however, had fallen into disgrace at court, and his application for a commission, repeated more than once, was refused by Louis XIV. This, and the influence of his mother, produced in him a lifelong resentment against the king. Having quitted France in disgust, he proceeded to Vienna, where his relative the emperor Leopold I. received him kindly, and he served with the Austrian corps during the campaign of 1683 against the Turks. He displayed his bravery in a cavalry fight at Petronell (7th July) and in the great battle for the relief of Vienna. The emperor now gave him the command of a regiment of dragoons. At the capture of Buda in 1686 he received a wound (3rd August), but he continued to serve up to the siege of Belgrade in 1688, in which he was dangerously wounded. At the instigation of Louvois, a decree of banishment from France was now issued against all Frenchmen who should continue to serve in foreign armies. "The king will see me again," was Eugene's reply when the news was communicated to him; he continued his career in foreign service.

Prince Eugene's next employment was in a service that required diplomatic as well as military skill (1689). He was sent by the emperor Leopold to Italy with the view of binding the duke of Savoy to the coalition against France and of cooperating with the Italian and Spanish troops. Later in 1689 he served on the Rhine and was again wounded. He returned to Italy in time to take part in the battle of Staffarda, which resulted in the defeat of the coalition at the hands of the French marshals of Villeroy and Luxemburg, and in the spring of 1691 Prince Eugene, after securing reinforcements, caused the siege of Coni to be raised, took possession of Carmagnola, and in the end completely defeated Catignat. He followed up his success by entering Dauphiné, where he took possession of Embrun and Gap. After another campaign, which was uneventful, the further prosecution of the war was abandoned owing to the defection of the duke of Savoy from the coalition, and Prince Eugene returned to Vienna, where he soon afterwards received the command of the army in Hungary, on the recommendation of the veteran count Rüdiger von Starhemberg, the defender of Vienna in 1683. It was about this time that Louis XIV. secretly offered him the bâton of a marshal of France, with the government of Champagne which his father had held, and also a pension. But Eugene rejected these offers with indignation, and proceeded to operate against the Turks commanded by Kara Mustapha. After some skilful manoeuvres, he surprised the enemy (September 11th, 1697) at Zenta, on the Theiss. His attack was vigorously resisted, and the victory was one of the most complete and important ever won by the Austrian arms. Formerly it was often stated that the battle of Zenta was fought against express orders from the court, that Eugene was placed under arrest for violating these orders, and that a proposal to bring him before a council of war was frustrated only by the threatening attitude of the citizens of Vienna. This story, minute in details as it is, is entirely without foundation. After a further period of manoeuvres, peace was at length concluded at Karlowitz on the 26th of January 1699.

Two years later he was again in active service in the War of
the Spanish Succession (q.v.). At the beginning of the year 1701 he was sent into Italy once more to oppose his old antagonist, Catinat. He achieved a rapid success, crossing the mountains from Tirol into Italy in spite of almost insurmountable difficulties (Journal d. militärrössisch. Verein, No. 5, 1907), forcing the French army, after sustaining several checks, to retire behind the Oglio, where a series of reverses equally unexpected and severe led to the recall of Catinat in disgrace. The incapable duchy of Villeroy, who succeeded to the command of which Catinat had been deprived, ventured to attack Eugene at Chiari, and was repulsed with great loss. And this was only the forerunner of more signal reverses; for, in a short time, Villeroy was forced to abandon the whole of the Mantuan territory and to take refuge in Cremona, where he seems to have considered himself secure. By means of a stratagem, however, Eugene penetrated into the city during the night, at the head of 2000 men, and, though he found it impossible to hold the town, succeeded in carrying off Villeroy as a prisoner. This was the capital blow to Eugene; a much abler general, replaced the captive, the incursion, daring though it was, proved anything but advantageous to the Austrians. The generalship of his new opponent, and the fact that the French army had been largely reinforced, while reinforcements had not been sent from Vienna, forced Prince Eugene to confine himself to a war of observation. The campaign was terminated by the sanguinary battle of Luzzara, fought on the 1st of August 1702, in which each party claimed the victory. Both armies having gone into winter quarters, Eugene returned to Vienna, where he was appointed president of the council of war. He then set out for Hungary in order to combat the insurgents in that country; but his means proving insufficient, he effected nothing of importance. The collapse of the revolt, however, soon freed the prince for the more important campaign in Bavaria, where, in 1704, he made his first campaign along with Marlborough. Similarity of tastes, views, and sentiments soon established between these two great men; a friendship which is rarely to be found amongst military chiefs, and contributed in the fullest measure to the success which the allies obtained. The first and perhaps the most important of these successes was that of Hochstädt or Blenheim (q.v.) on the 3rd of August 1704, where the English and imperial troops triumphed over one of the finest armies that France had ever sent into Germany.

But since Prince Eugene had quitted Italy, Vendôme, who commanded the French army in that country, had obtained various successes against the duke of Savoy, who had once more joined Austria. The emperor deemed the crisis so serious that he recalled Eugene and sent him to Italy to the assistance of his ally. Vendôme at first opposed great obstacles to the plan which the prince had formed for carrying succours into Piedmont; but after a variety of marches and counter-marches, in which both commanders displayed signal ability, the two armies met at Cassano (August 16, 1705), where a deadly engagement ensued, and Prince Eugene received two severe wounds which forced him to quit the field. This accident decided the fate of the battle and for the time suspended the prince's march towards Piedmont. Vendôme, however, was recalled, and La Feuillade (who succeeded him) was incapable of long arresting the progress of such a commander as Eugene. After once more passing several rivers in presence of the French army, and executing one of the most skilful and daring marches he had ever performed, the latter appeared before the entrenched camp at Turin, which place the French were now besieging with an army eighty thousand strong. Prince Eugene had only thirty thousand men; but his antagonist the duke of Orleans, though full of zeal and courage, wanted experience, and Marshal Marsin, his adiutus, held powers from Louis XIV. which could only induce distrust in the French commanders. With equal courage and address, Eugene profited by the misunderstandings between the French generals; and on the 7th of September 1706 he attacked the French army in its entrenchments and gained a victory which decided the fate of Italy. In the heat of the battle Eugene received a wound, and was thrown from his horse.

His recompense for this important service was the government of the Milanese, of which he took possession with great pomp on the 16th of April 1707. He was also made lieutenant-general to the emperor Joseph I.

The attempt which he made against Toulon in the course of the same year failed completely, because the invasion of the kingdom of Naples retarded the march of the troops which were to have been employed in it, and this delay afforded Marshal de Tessé time to make good dispositions. Obliged to renounce his project, therefore, the prince went to Vienna, where he was received with great enthusiasm both by the people and by the court. "I am very well satisfied with you," said the emperor, "excepting on one point only, which is, that you expose yourself too much." This monarch immediately despatched Eugene to Holland, and to the different courts of Germany, in order to forward the necessary preparations for the campaign of the following year, 1708 (see SAVOY, PRINCE OF, WAR OF 9TH)

Early in the spring of 1708 the prince proceeded to Flanders, in order to assume the command of the German army which his diplomatic ability had been mainly instrumental in assembling, and to unite his forces with those of Marlborough. The campaign was opened by the victory of Oudenarde (q.v.), to which the perfect union of Marlborough and Eugene on the one hand, and the misunderstanding between Vendôme and the duke of Burgundy on the other, seem to have equally contributed. The French immediately abandoned the Low Countries, and, remaining in observation, made no attempt whatever to prevent Eugene's army, covered by that of Marlborough, making the siege of Lille. The French governor, Boufflers, made a glorious defence, and Eugene paid a flattering tribute to his valor in inviting him to prepare the articles of capitulation himself, with the words "I subscribe to everything beforehand, well persuaded that you will not insert anything unworthy of yourself or of me." After this important conquest, Eugene and Marlborough proceeded to the Hague, where they were received in the most flattering manner by the public, by the states-general, and above all, by their esteemed friend the pensionary Heinsius. Negotiations were then opened for peace, but proved fruitless. In 1709 France put forth a supreme effort, and placed Marshal Villars, her best living general, in command. The events of this year were very different to those of previous campaigns, and the bloody battle of Malplaquet (q.v.), though a victory for Marlborough and Eugene, led to little result, and this at the cost of enormous losses. The Dutch army, it is said, never recovered from the slaughter of Malplaquet; indeed, the success was so dearly bought that the allies found themselves soon afterwards of all condition to undertake anything. Their army accordingly went into winter quarters, and Prince Eugene returned to Vienna, whence the emperor almost immediately despatched him to Berlin. From the king of Prussia the prince obtained everything which he had been instructed to require; and having thus fulfilled his mission, he returned into Flanders, where, excepting the capture of Douai, Bethune and Aire, the campaign of 1710 presented nothing remarkable. On the death of the emperor Joseph I. in April 1711, Prince Eugene, in concert with the empress, exerted his utmost endeavours to secure the crown to the archduke, who afterwards ascended the imperial throne under the name of Charles VI. In the same year the changes which had occurred in the policy, or rather the caprice, of Queen Anne, brought about an approximation between England and France, and put an end to the influence which Marlborough had hitherto possessed. When this political revolution became known, Prince Eugene immediately repaired to London, charged with a mission from the emperor to re-establish the credit of his illustrious companion in arms, as well as to re-attach England to the coalition. The mission having proved unsuccessful, the emperor found himself under the necessity of making the campaign of 1712 with the aid of the Dutch alone. The defection of the English, however, did not induce Prince Eugene to abandon his favourite plan of invading France. He resolved, at whatever cost, to penetrate into Champagne; and in order to support his operations by the
which arose out of the succession of Augustus II. to the throne of Poland having afforded Austria a pretext for attacking France, war was resolved on, contrary to the advice of Eugene (1734).

In spite of this, however, he was appointed to command the army destined to act upon the Rhine, which from the commencement had very superior forces opposed to it; and if it could not prevent the capture of Philippsburg after a long siege, at least prevented the enemy from entering Bavaria. Prince Eugene, having now attained his seventy-first year, no longer possessed the vigour and activity necessary for a general in the field, and he welcomed the peace which was concluded on the 3rd of October 1715.

On his return to Vienna his health declined more and more, and he died in that capital on the 21st of April 1736, leaving an immense inheritance to his niece, the princess Victoria of Savoy.

Of a character cold and severe, Prince Eugene had almost no other passion than that of glory. He died unmarried, and seemed so little susceptible to female influence that he was styled a Mars without a Venus. That he was one of the great captains of history is universally admitted. He was strangely unlike the commanders of his time in many respects, though as a matter of course he was, when he sat fit to follow the accepted rules. Whatever he did, the special characteristics of his generalship were imagination, fiery energy, and a tactical resolution which was rare indeed in the 18th century. Despising the lives of his soldiers as much as he exposed his own, it was always by persevering efforts and great sacrifices that he obtained victory. His almost invariably success raised the reputation of the Austrian army to a point which it never reached either before or since his day. War was with him a passion. Always on the march, in camps, or on the field of battle during more than fifty years, and under the reigns of three emperors, he had scarcely passed two years together without fighting. Yet his political activity was not inconsiderable, and his advice was always sound and well-considered; while in his government of the Netherlands, which he exercised through the marquis de Prié, he set himself resolutely to oppose the many wild schemes, such as Law's Mississippi project, in which the times were so fertile. His interest in literature and art has been alluded to above. His palace in Vienna, and the Belvedere near that city, his library, and his collection of paintings, were renowned. Prince Eugene was taller than a man of average size, upon the whole, well made; the cast of his visage was somewhat long, his mouth moderate and almost always open; his eyes were black and animated, and his complexion such as became a warrior.

See A. v. Arneuth, Prinz Eugene (3 vols., Vienna, 1858; 2nd ed., 1864); H. v. Sybel, Prinz Eugen von Savoyen (Munich, 1868); Austrian official history, Feldzüge des Prinzen Eugen von Savoyen (Vienna, 1876); Malleson, Prince Eugene (London, 1888); Heller, Militärische Korrespondenz des Prinzen Eugen (Vienna, 1848); Keynon, Prinz Eugen (Freiburg, 1890); Oesterr. militärische Zeitschrift ("Streffeur"); Rider's Oesterr. Archiv für Geschichte (1851-1853); Archivio storico Italiano, vol. 17; Mitteil. des Instituts für öster. Geschichtsforschung, vol. 3.

The political memoirs attributed to Prince Eugene (ed. Sartori, Tübingen, 1812) are spurious; see Böhm, Die Sammlung der hinterlassenen politischen Schriften des Prinzen Eugen (Freiberg, 1900).

**EUGENE**

**EUGENE**

eu, a city and the county-seat of Lane county, Oregon, U.S.A., on the Willamette river, at the head of navigation, about 73 m. S. of Portland. Pop. (1900) 3,236, of whom 237 were foreign-born. (1910) Federal census 9,006. Eugene is served by the Southern Pacific railroad and by interurban electric railway. It is situated on the edge of a broad and fertile prairie, at the foot of a ridge of low hills and within view of the peaks of the Coast Range; the streets are pleasantly shaded with Oregon maples. The city is most widely known as the seat of the University of Oregon. This institution, opened in 1876 and having 95 instructors and 734 students in 1907-1908, occupies eight buildings on a grassy slope along the river bank, and embraces a college of literature, science and the arts, a college of engineering, a graduate school, and (at Portland) a school of law and a school of medicine. In the city is the Eugene Divinity School of the Disciples of Christ, opened in 1895. Eugene is the commercial centre of an extensive agricultural district; does a large business
in grain, fruit, hops, cattle, wool and lumber; and has various manufactures, including flour, lumber, woollen goods and canned fruit. Eugene was settled in 1854, and was first incorporated in 1864.

Eugenics (from the Gr. eugenēs, well born), the modern name given to the science which deals with the influences which improve the inborn qualities of a race, but more particularly with those which develop them to the utmost advantage, and which generally serves to disseminate knowledge and encourage action in the direction of perpetuating a higher racial standard. The founder of this science may be said to be Sir Francis Galton (q.v.), who has done much to further its study, not only by his writings, but by the establishment of a research fellowship and scholarship in eugenics in the university of London. The aim of the science as laid down by Galton is to bring as many influences as can reasonably be employed, to cause the useful classes in the community to contribute more than their proportion to the next generation. It can hardly be said that the science has advanced beyond the stage of disseminating a knowledge of the laws of heredity, so far as they are surely known, and endeavouring to promote their further study. Useful work has been done in the compilation of statistics of the various conditions affecting the science, such as the rates with which the various classes of society in ancient and modern nations have contributed to civic usefulness to the population at various times, the inheritance of ability, the influences which affect marriage, &c.

Works by Galton bearing on eugenics are: Hereditary Genius (2nd ed., 1892), Human Faculty (1883), Natural Inheritance (1889), Human and Physical Conditions of the Antropoid, Inst. on the Possible Improvement of the Human Breed under the existing Conditions of Law and Sentiment (1901); see also Biometrica (a journal for the statistical study of biological problems, of which the first volume was published in 1902).

Eugenie [Marie Eugenie-Ignace-Augustine de Montijo] (1826-1914), wife of Napoleon III., emperor of the French, daughter of Don Cipriano Guzman y Porto Carrero, count of Teba, subsequently count of Montijo and grandee of Spain, was born at Granada on the 29th of May 1826. Her mother was a daughter of William Kirkpatrick, United States consul at Malaga, a Scot by birth and an American by nationality. Her childhood was spent in Madrid, but after 1834 she lived with her mother and sister chiefly in Paris, where she was educated like the other French girls of her rank, and in the convent of the Sacre Coeur. When Louis Napoleon became president of the Republic she appeared at the Elysee, and it was there that she made the acquaintance of her future husband. In November 1852 mother and daughter were invited to Fontainebleau, and in the picturesque hunting parties the beautiful young Spaniard, who showed herself an expert horsewoman, was greatly admired by all present and by the host in particular. Three weeks later, on the 22nd of December, the Empire was formally proclaimed, and during a series of fêtes at Compiegne, which lasted eleven days (19th to 30th December), the emperor became more and more fascinated. On New Year's Eve, at a ball at the Tuileries, Mlle de Montijo, who had necessarily excited much jealousy and hostility in the female world, had reason to complain that she had been insulted by the wife of an official personage. On hearing of it the emperor said to her, "Je vous vengerai!"; and within three days he made a formal proposal of marriage. In a speech from the throne on the 22nd of January he formally announced his engagement and declared that he was educated considered a mésalliance. "I have preferred," he said, "a woman whom I love and respect to a woman unknown to me, with whom an alliance would have had advantages mixed with sacrifices." Of her whom he had chosen he ventured to make a prediction: "Endowed with all the qualities of the soul, she will be the ornament of the throne, and in the day of danger she will become one of its courageous supports." The marriage was celebrated with great pomp at Notre Dame on the 30th of January 1853. On the 16th of March 1856 the empress gave birth to a son, who received the title of Prince Imperial. The emperor's prediction regarding her was not belied by events. By her beauty, elegance and charm of manner she contributed largely to the brilliancy of the imperial régime, and when the end came, she was, as the official Empress made by her enemies proved, one of the very few who showed calmness and courage in face of the rising tide of revolution. The empress acted three times as regent during the absence of the emperor,—in 1850, 1865 and 1870,—and she was generally consulted on important questions. When the emperor vacillated between two lines of policy she generally urged on him the bolder course; she deprecated everything tending to diminish the temporal power of the papacy, and she disapproved of the emperor's liberal policy at the close of his reign. On the collapse of the Empire she fled to England, and settled with the emperor and her son at Chislehurst. After the emperor's death she removed to Farnborough, where she built a mausoleum to his memory. In 1879 her son was killed in the Zulu War, and in the following year she visited the spot and brought back the body to be interred beside that of her father. At Farnborough, and in a villa she built at Cap Martin on the Riviera, she continued to live in retirement, following closely the course of events, but abstaining from all interference in French politics.

Eugenius, the name of four popes.

Eugenius I., pope from 654 to 657. Elected on the disbandment of Martin I. by the emperor Constans II., and at the height of the Monothelite crisis, he showed greater deference than his predecessor to the emperor's wishes, and made no public stand against the patriarchs of Constantinople. He, however, held no communication with them, being closely watched in this respect by Roman opinion.

Eugenius II., pope, was a native of Rome, and was chosen to succeed Pascal I. in 824. His election did not take place without difficulty. Eugenius was the candidate of the nobles, and the clerical faction brought forward a competitor. But the monk Wala, the representative of the emperor Lothair, succeeded in arranging matters, and Eugenius was elected. Lothair, however, came to Rome in person, and took advantage of this opportunity to redress many abuses in the papal administration, to vest the election of the pope in the nobles, and to confirm the statute that no pope should be consecrated until his election had the approval of the emperor. A council which assembled at Rome during the reign of Eugenius passed several enactments for the benefit of the clergy of the diocese of Reims, and the foundation of schools and chapters, and decided against priests wearing a secular dress or engaging in secular occupations. Eugenius also adopted various provisions for the care of the poor and of widows and orphans. He died in 827.

Eugenius III. (Bernardo Paganeli), pope from the 15th of February 1145 to the 5th of July 1153, a native of Pisa, was abbot of the Cistercian monastery of St Anastasia at Rome when suddenly elected to succeed Lucius II. His friend and instructor, Bernard of Clairvaux, the most influence ecclesiastic of the time, reproached against his election on account of his "innocence and simplicity," but Bernard soon acquiesced and continued to be the mainstay of the papacy throughout Eugenius's pontificate. It was to Eugenius that Bernard addressed his famous work De consideratione. Immediately after his election, the Roman senators demanded the pope's renunciation of temporal power. He refused and fled to Farfa, where he was consecrated on the 17th of February. By treaty of December 1145 he recognized the republic under his suzerainty, substituted a papal prefect for the "patrician" and returned to Rome. The celebrated schismatic, Arnold of Brescia, however, put himself again at the head of the party opposed to the temporal power of the papacy, re-established the patriciate, and forced the pope to leave Rome. Eugenius had already, on hearing of the fall of Edessa, addressed a letter to Louis VII. of France (December 1145), announcing the Second Crusade and granting plenary indulgence under the usual conditions to those who would take the cross; and in January 1147 he journeyed to France to further preparations for the holy war and to seek aid in the constant feuds at Rome. After holding synods at Paris, Reims and Trier, he returned to Italy in June 1148 and took up
his residence at Viterbo. The following month he excommunicated Arnold of Brescia in a synod at Cremona, and thenceforth devoted most of his energies to the recovery of his see. As the result of negotiations between Frederick Barbarossa and the Romans, Eugenius was finally enabled to return to Rome in December 1152, but died in the following July. He was succeeded by Anastasius IV. Eugenius retained the stoic virtues of monasticism throughout his stormy career, and was deeply revered for his personal character. His tomb in St Peter's acquired fame for miraculous cures, and he was pronounced blessed by Pius IX. in 1872.

The chief sources for the career of Eugenius III. are his letters in J. P. Migne, Patrolog. Lat. vol. 106, 180, 182, and in Bibliothèque de l'École des chartes, x. (1886); the life by Cardinal Boso in J. M. Watterich, Pontif. V. (1885); and the account by John of Salisbury in Monumenta Germaniae historica. Scriptores, vol. 20.

Neumann, Bernard von Clairvaux. u. der Convent der zweiten Kreuzzugs (Heidelberg, 1882); R. Kugler, Analekten zur Geschichte des zweiten Kreuzzugs (Tübingen, 1878, 1883).

EUGENIVUS IV. (Gabriel Condulmier), pope from the 3rd of March 1431 to the 23rd of February 1447, was born at Venice of a merchant family in 1383. He entered the Celestine order and came into prominence during the pontificate of his uncle, Gregory XII., by whom he was appointed bishop of Siena, papal treasurer, protonotary, cardinal-priest of St Marco e St Clemente, and later cardinal-priest of Sta Maria in Trastevere. His violent measures, as pope, against the relations of his predecessor, Martin V., at once involved him in a serious conflict with the pious house of Colonna. But by far the most important trait of Eugenius's pontificate was the great struggle between pope and council. On the 23rd of July 1431 his legate opened the council of Basel which had been convened by Martin, but, distrustful of its purposes and moved by the small attendance, the pope issued a bull on the 15th of December 1431, dissolving the council and calling a new one to meet in eighteen months at Bologna. The council refused to dissolve, renewed the revolutionary resolutions by which the council of Constance had been declared superior to the pope, and cited Eugenius to appear at Basel. A compromise was arranged by Sigismund, who had been crowned emperor at Rome on the 31st of May 1433, by which the pope recalled the bull of dissolution, and, reserving the rights of the Holy See, acknowledged the council as ecumenical (15th of December 1435). The establishment of an insurrectional republic at Rome drove him into exile in May 1434, and, although the city was restored to obedience in the following October, he remained at Florence and Bologna. Meanwhile the struggle for ecclesiastical reform continued, and in 1438 was renewed by his new legate Cardinal Hohenems, who convoked a rival council at Ferrara on the 8th of January 1438 and communicated the pretenses assembled at Basel. The result was that the latter formally deposed him as a heretic on the 25th of June 1439, and in the following November elected the ambitious Amadus VIII., duke of Savoy, antipope under the title of Felix V. The conduct of France and Germany seemed to warrant this action, for Charles VII. had introduced the decrees of the council of Basel, with slight changes, into the former country through the Pragmatic Sanction of Bourges (7th of July 1438), and the diet of Maim had depriyed the pope of most of his rights in the latter country (26th of March 1439). At Florence, whither the council of Ferrara had been transferred on account of an outbreak of the plague, was effected in July 1439 a union with the Greeks, which, as the result of political necessities, proved but temporary. This union was followed by others of even less stability. Eugenius signed an agreement with the Armenians on the 22nd of November 1439, and with a part of the Jacobites in 1445; and in 1445 he received the Nestorians and Maronites. He did his best to stem the Turkish advance, pledging one-fifth of the papal income to the crusade which set out in 1444, but which met with reforming defeat. His rival, Felix V., meanwhile obtained small recognition, and his latter's ablest adviser, Aeneas Sylvius Piccolomini, made peace with Eugenius in 1445. The pope's recognition of the claims to Naples of King Alphonso of Aragon withdrew the last important support from the council of Basel, and enabled him to make a victorious entry into Rome on the 28th of September 1443, after an exile of nearly ten years. His protests against the Pragmatic Sanction of Bourges were ineffectual, but by means of the Concordat of the Princes, negotiated by Piccolomini with the electors in February 1447, the whole of Germany declared against the antipope. Although his pontificate had been so stormy and torrential that he is said to have regretted on his death-bed that he ever left his monastery, nevertheless Eugenius's victory over the council of Basel and his efforts in behalf of church unity contributed greatly to break down the conciliar movement and restore the papacy to the position it had held before the Great Schism. Eugenius was dignified in demeanour, but inexperienced and vacillating in action and excitable in temper. Ridden by his hatred of heresy, he yet displayed great kindness to the poor. He laboured to re-establish the monastic orders, especially the Franciscan, and was never guilty of nepotism. Although a type of the austere monk in his private life, he was a sincere friend of art and learning, and in 1431 re-established finally the university at Rome. He died on the 23rd of February 1447, and was succeeded by Nicholas V.

EUGENOL (allyl guaiacol, eugenolic acid), C₇H₆O₃, an odouriferous principle; it is the chief constituent of oil of cloves, and occurs in many other essential oils. It can be synthetically prepared by the reduction of conifer alcohol, (HO)(CH₃)(O)C₆H₄.CH=CH.CH=CH.OH, which occurs in combination with glucose in the glucoside coniferylglucose, C₃₃H₃₄O₁₄,less oil boiling at 247°C., and having a spicy odour. On oxidation it is converted into the dihydroxy derivative, which on permanegation it gives homovanillic, vanillin, &c.; with chromic acid in acetic acid solution it is converted into carbon dioxide and acetic acid, whilst nitric acid oxidizes it to oxalic acid. By the action of alkalis it is converted into iso-eugenol, which on oxidation yields vanillin, the odoriferous principle of vanilla (g.e.). This transformation of allyl phenols into propenyl phenols is very general (see Ber., 1889, 22, p. 2747; 1890, 23, p. 862). Alkaline fission of eugenol gives protocatechuic acid. The amount of eugenol in oil of cloves can be estimated by acetylation, in presence of pyridine (A. Verley and Fr. Baelings, Ber., 1901, 34, p. 3359). Chavibetol, an isomer of eugenol, occurs in the ethereal oil obtained from Piper betle.

The structural relations are:

EUEPERUS [EueMERUS, EUEMERUS], Greek mythographer, born at Messana, in Sicily (others say at Chios, Tegea, or Messene in Peloponnesse), flourished about 300 B.C., and lived at the court of Cassander. He is chiefly known by his Sacred History ('Iēdē ἄραγαθῆ), a philosophical romance, based upon archaic inscriptions which he claimed to have found during his travels in various parts of Greece. He particularly relies upon an account of early history which he discovered on a golden pillar in a temple on the island of Pandara when he was on a voyage round the coast of Arabia, undertaken at the request of Cassander, his friend and patron. There is apparently no doubt that this island is
imaginary. In this work he for the first time systematized an old Oriental (perhaps Phoenician) method of interpreting the popular myths, asserting that the gods who formed the chief objects of popular worship had been originally heroes and conquerors, who had thus earned a claim to the veneration of their subjects. This system spread widely, and the early Christians especially appealed to it as a confirmation of their belief that ancient mythology was merely an aggregate of fables of human invention. Euhemerus was a firm upholder of the Cyrenian philosophy, and by many ancient writers he was regarded as an atheist. His work was translated by Ennius into Latin, but the work itself is lost, and of the translation only a few fragments, and these very short, have come down to us.

This rationalizing method of interpretation is known as Euhemerism. There is no doubt that it contains an element of truth; as among the Romans the gradual deification of ancestors and the apotheosis of emperors were prominent features of religious development, so among primitive peoples it is possible to trace the evolution of family and tribal gods from great chiefs and warriors. All theories of religion which give prominence to ancestor worship and the cult of the dead are to some extent Euhemeristic. But as the sole explanation of the origin of the idea of gods it is not accepted by students of comparative religion. It had, however, considerable vogue in France. In the 18th century the abbé Banier, in his *Théologie et la faible explication de l'histoire*, was frankly Euhemeristic; other leading Euhemerists were Clavier, Sainte-Croix, Raoul Rochette, Em. Hoffmann and to a great extent Herbert Spencer.

See Raymond de Block, *Éuhémérie, son livre et sa doctrine* (Mons, 1876); G. N. Némethy, *Euhemer ü RELIGITÓGA* (Budapest, 1889); Gams, *Quaestiones Euhemerinae* (Kempen, 1860); Otto Sieroka, *Die Euhemerismus* (Sassenheim, *Geschichte der griechischen Lehre in der Alexandrinerzeit*, vol. i. (Leipzig, 1891); and works on comparative religion and mythology.

**EULENSPIEGEL [EULENSPIEGEL], TILL,** the name of a German folk-hero, and the title of a popular German chapbook on the subject, of the beginning of the 16th century. The oldest existing German text of the book was printed at Strassburg in 1515 (*Ein kurzeziglich leyst von Dyl Uelenspygel, wie dem land zu Brunswick*), and again in 1519. It is not in the original dialect, which was undoubtedly Low Saxon, but in High German, the translation having been formerly ascribed—but on insufficient evidence—to the Catholic satirist Thomas Murner. Its hero, Till Eulenspiegel or Uleenspiegel, the son of a peasant, was born at Knielingen in Brunswick, at the end of the 13th or at the beginning of the 14th century. He died, according to tradition, at Mölln near Lübeck in 1350. The jests and practical jokes ascribed to him were collected—if we may believe a statement in one of the old prints—in 1523; but in any case the edition of 1535 was not even the oldest High German edition. Eulenspiegel himself is locally associated with the Low German area extending from Magdeburg to Hanover, and from Lüneburg to the Harz Mountains. He is the wily peasant who loves to exercise his wit and roguery on the tradespeople of the towns, above all, on the innkeepers; but priests, noblemen, even princes, are also among his victims. His victories are often pointed at the facades of the church; he delights in the scurrility and obscenity, while of the finer, smarter wit which the humanists and the Italians introduced into the anecdote, he has little or nothing. His jests are coarsely practical, and his satire turns on class distinctions. In fact, this chapbook might be described as the retaliation of the peasant on the townsmen who in the 14th and 15th centuries had begun to look down upon the country boor as a natural inferior.

In spite of its essentially Low German character, *Eulenspiegel* was extremely popular in other lands, and, at an early date, was translated into Dutch, French, English, Latin, Danish, Swedish, Bohemian and Polish. In England, "Howleglass" (Scottish, *Holliglass*) was long a familiar figure; his jests were rapidly adapted to English conditions, and appropriated in the collections associated with Robyn Goodfellow, Scogan and others. Ben Johnson refers to him as "Howleglass" and "Ulenspiegel" in his *Masque of the Fortunate Isles, Fooleater, Alchemist and Sad Shepherd*, and a verse by the "water poet" would seem to imply that the "Owlglasse" was a familiar popular type. The Eulenspiegel "serpency play", has been made the subject of a well-known orchestral symphony by Richard Strauss. In France, it may be noted, the name has given rise to the words *espiègle* and *espièglerie*.

The Strassburg edition of 1515 (British Museum) has been reprinted by H. Knust in the *Neudrucke deutscher Literaturwerke der 16. und 17. Jahrh. No. 55-56* (1883); that of 1519 by J. M. Lappenberg, *Thomae Murneri Eulenspygelius* ("des Prosaromanus in Deutschland" in *Quellen und Forschungen*, vol. xxi, pp. 28 ff. and 78 ff.) has shown that there must have been a still earlier High German edition. See also C. Walter in *Nicolaus von der Zehden* (1912). In 1544, copies appeared at Cologne, printed by Servais Kruft, undated (reproduced in photo-lithography from the two imperfect copies in Berlin and Vienna, 1865); Erfurt, 1532, 1533-1537 and 1538; Cologne, 1540, Strassburg, 1542, 1543-1543, Frankfurt on the Main, 1545, Strassburg, 1551, Cologne, 1554, &c. Johann Fichst published an adaptation in verse, *Der Eulenspiegel Reimenesweis* (Strassburg, 1571), K. Simrock a modernization in 1864 (and 1878); there is also one by K. Pardach in Reclain's *Universalbibliothek* (1883). The earliest translation was that into Dutch, printed by Hoochstraten at Antwerp (Royal Lib., Cologne); it is undated, but may have appeared as early as 1531. A translation by William Adams (1665) is mentioned as having served as the basis for the first version: *Eulenspiegel, de sa vie, de ses œuvres et merveilleuses aventures par luy faictes*. The first English translation was made from the Dutch, and bears the title *Here behinheth a merje Jest of a man called Howleglowe, &c.*, printed by Copland in three editions, probably between 1548 and 1590. A version by the Rev. D. Woolworth, which was itself merely a reprint of a still older English edition (1518), is mentioned as having served as the basis for the British Museum. *Eulenspiegel* possesses fragments. Reprinted by F. Brie, *Eulenspiegel in England* (1903). In 1720 appeared *The German Rogue*, or the Life, Witty Sayings, and Jests of Tiel Eulenspiegel. Made English from the Dutch-High and an English adaptation of it, completed by R. K. R. Mackenzie in 1820 (2nd ed., 1890). On Eulenspiegel in England, see especially C. H. Herford, *Studies in the Literary Relations of England and Germany in the Sixteenth Century* (1888), pp. 242 ff., and F. Engel, who already refers to the British Museum.

**EULER, LEONHARD** (1707-1878), Swiss mathematician, was born at Basel on the 15th of April 1707, his father Paul Euler, who had considerable attainments as a mathematician, being Calvinistic pastor of the neighboring village of Riechen. After receiving preliminary instructions in mathematics from his father, he was sent to the university of Basel, where geometry soon became his favourite study. His mathematical genius gained for him a high place in the esteem of Jean Bernoulli, who was at that time one of the first mathematicians in Europe, as well as of his sons Daniel and Nicolas Bernoulli. Having taken his degree as master of arts in 1723, Euler applied himself, at his father's desire, to the study of theology and the Oriental languages with the view of entering the church, but, with his father's consent, he soon returned to geometry as his principal pursuit. At the same time, by the advice of the younger Bernoulli, who had removed to St Petersburg in 1725, he applied himself to the study of physiology, to which he made a happy application of his mathematical studies. He also attended the medical lectures at Basel. While he was engaged in physiological researches, he composed a dissertation on the nature and propagation of sound, and an answer to a prize question concerning the mastings of ships, to which the French Academy of Sciences adjudged the second rank in the year 1727.

In 1727, on the invitation of Catherine I., Euler took up his residence in St Petersburg, and was made an associate of the Academy of Sciences. In 1730 he became professor of physics, and in 1733 he succeeded Daniel Bernoulli in the chair of mathematics. At the commencement of his new career he enriched the academical collection with many memoirs, which excited a noble emulation between him and the Bernoullis, though this did not in any way affect their friendship. It was at this time that he carried the integral calculus to a higher degree of perfection, invented the calculation of sines, reduced analytical operations
to a greater simplicity, and threw new light on nearly all parts of pure mathematics. In 1735 a proposal posed by the academy, for the solution of which several eminent mathematicians had demanded the space of some months, was solved by Euler in three days, but the effort threw him into a fever which endangered his life and deprived him of the use of his right eye. The Academy of Sciences at Paris in 1738 adjudged the prize to his memoir on the nature and properties of fire, and in 1740 his treatise on the tides shared the prize with those of Colin Maclaurin and Daniel Bernoulli—a higher honour than if he had carried it away from inferior rivals.

In 1741 Euler accepted the invitation of Frederick the Great to Berlin, where he was made a member of the Academy of Sciences and professor of mathematics. He enriched the last volume of the Miscellanea or Miscellaneous of Berlin with five memoirs, and these were followed, with an astonishing rapidity, by a great number of important researches, which are scattered throughout the annual memoirs of the Prussian Academy. At the same time he continued his philosophical contributions to the Academy of St Petersburg, which granted him a pension in 1744. The respect in which he was held by his academy was strikingly shown in 1760, when a farm he occupied near Charlottenburg happened to be pillaged by the invading Russian army. On its being ascertained that the farm belonged to Euler, the general immediately ordered compensation to be paid, and the empress Elizabeth sent an additional sum of four thousand crowns.

In 1766 Euler with difficulty obtained permission from the king of Prussia to return to St Petersburg, to which he had been originally invited by Catherine II. Soon after his return to St Petersburg a cataract formed in his left eye, which ultimately deprived him almost entirely of sight. It was in these circumstances that he dictated to his servant, a tailor's apprentice, who was absolutely devoid of mathematical knowledge, his Anleitung zur Algebra (1770), a work which, though purely elementary, displays the mathematical genius of its author, and is still reckoned one of the best works of its class. Another task to which he set himself immediately after his return to St Petersburg was the preparation of his Lettres à une princesse d'Allemagne sur quelques sujets de physique et de philosophie (3 vols., 1768–1772). They were written at the request of the princess of Anhalt-Dessau, and contain an admirably clear exposition of the principal facts of mechanics, optics, acoustics and physical astronomy. Theory, however, is frequently unsoundly applied in it, and it is to be observed generally that Euler's strength lay rather in pure than in applied mathematics.

In 1755 Euler had been elected a foreign member of the Academy of Sciences at Paris, and some time afterwards the academical prize was adjudged to three of his memoirs Concerning the Inequalities in the Motions of the Planets. The two prize-questions proposed by the same academy for 1770 and 1772 were designed to obtain a more perfect theory of the moon's motion. Euler, assisted by his eldest son Johann Albert, was a competitor for these prizes, and obtained both. In the second memoir he reserved for further consideration several inequalities of the moon, which he could not determine in his first, on account of the complicated calculations which the method he then employed had engaged him. He afterwards reviewed his whole theory with the assistance of his son and W. L. Kraft and A. J. Lexell, and pursued his researches until he had constructed the new tables, which appeared in his Theoria motuum lunae (1772). Instead of confining himself, as before, to the fruitless integration of three differential equations of the second degree, which are furnished by mathematical principles, he reduced them to the three co-ordinates which determine the place of the moon; and he divided into classes all the inequalities of that planet, as far as they depend either on the elongation of the sun and moon, or upon the eccentricity, or the parallax, or the inclination of the lunar orbit. The inherent difficulties of this task were immensely enhanced by the fact that Euler was virtually blind, and had to carry all the elaborate computations it involved in his memory. A further difficulty arose from the burning of his house and the destruction of the greater part of his property in 1771. His manuscripts were fortunately preserved. His own life was only saved by the courage of a native of Basel, Peter Grimm, who carried him out of the burning house.

Some time after this an operation restored Euler's sight; but a too harsh use of the recovered faculty, along with some carelessness on the part of the surgeons, brought about a relapse. With the assistance of his sons, and of Kraft and Lexell, however, he continued his labours, neither the loss of his sight nor the infirmities of an advanced age being sufficient to check his activity. Having engaged to furnish the Academy of St Petersburg with as many memoirs as would be sufficient to complete its Acta for twenty years after his death, he in seven years transmitted to the academy above seventy memoirs, and left above two hundred more, which were revised and completed by another hand.

Euler's knowledge was more general than might have been expected in one who had pursued with such unremitting ardour mathematics and astronomy as his favourite studies. He had despised nothing, and the different characters of his researches, whether in the examination of the properties of numbers or in the solution of the problems of mechanics and of the construction of the mathematical instruments, which he had so skilfully invented, showed him to be a man of unusually varied knowledge, and a universal genius.

He was twice married, his second wife being a half-sister of his first, and he had a numerous family, several of whom attained to distinction. His Elogio was written for the French Academy by the marquis de Condorcet, and an account of his life, with a list of his works, was written by Von Fuss, the secretary to the Imperial Academy of St Petersburg.
EUMENES—EUMENIUS 889

Etablissements en faveur tant de vains que des morts, without a date: Opuscula analyticæ (St. Petersburg, 1783–1785, in 2 vols. 4to).
See Rudio, Leonard Euler (Basel, 1884); M. Cantor, Geschichte der Mathematik.

EUMENES, the name of two rulers of Pergamum.

1. Eumenes I. succeeded his uncle Philaretus in 263 b.c. The only important event in his reign was his victory near Sardis over Antiochus Soter, which enabled him to secure possession of the districts round his capital. (See Pergamum.)

2. Eumenes II., son of Attalus I., was king of Pergamum from 197–159 b.c. During the greater part of his reign he was a loyal ally of the Romans, who bestowed upon him signal marks of favour. He materially contributed to the defeat of Antiochus at Magnesia (190), and as a reward for his services the Thracian Chersonese and all Antiochus' possessions east of the Taurus were bestowed upon him, including a protectorate of such Greek cities as had not been declared free. In his quarrels with his neighbours the Romans intervened on his behalf, and on the occasion of his visit to Rome to complain of the conduct of Perseus, king of Macedonia, he was received with the greatest distinction. On his return journey he narrowly escaped assassination by the emissaries of Perseus. Although he supported the Romans in the war against Macedonia, he displayed so little energy and interest (even recalling his auxiliaries) that he was suspected of intriguing with the enemy. According to Polybius there was some foundation for the suspicion, but Eumenes declared that he had merely been negotiating for an exchange of prisoners. Nothing, however, came of these negotiations, whatever may have been their real object; and Eumenes, in order to avert suspicion, sent his congratulations to Rome by his brother Attalus after the defeat of Perseus (168). Attalus was received courteously but coldly; and Eumenes in alarm set out to visit Rome in person, but on his arrival at Brundusium was ordered to leave Italy at once. Eumenes never regained the good graces of the Romans, who showed especial favour to Attalus on his second visit to Rome, probably with the object of setting him against Eumenes; but the ties of kinship proved too strong. The last years of his reign were disturbed by renewed hostilities against Prusias of Bithynia and the Celts of Galatia, and probably only his death prevented a war with Rome. Eumenes, although physically weak, was a shrewd and vigorous ruler and politician, who raised his little state from insignificance to a powerful monarchy. During his reign Pergamum became a flourishing city, where men of learning were always welcome, among them Crates of Mallus, the founder of the Pergamene school of criticism. Eumenes adorned the city with splendid buildings, amongst them the great altar with the frieze representing the Battle of the Giants; but the greatest monument of his liberality was the foundation of the library, which was second only to that of Alexandria.

See Livy xxxix., 51, xlii. 11-16; Polybius xvi.-xxvii.; Appian, Syracus. Livy, Epit. 46; Cornelius Nepos, Hannibal, to: A. G. van Cappelle, Commentatio de regibus et antiquitatis Pergamum (Amsterdam, 1841). For the altar of Zeus, see Pergamum; for treaty with Creton cities (183 B.C.) see Monumenti antiqui, xviii. 177.

EUMENES (c. 360–316 B.C.), Macedonian general, was a native of Cardia in the Thracian Chersonese. At a very early age he was employed as private secretary by Philip II. of Macedon, and on the death of that prince, by Alexander, whom he accompanied into Asia. In the division of the empire on Alexander's death, Cappadocia and Paphlagonia were assigned to Eumenes; but as they were not yet subdued, Leontnius and Antigonus were charged by Perdiccas to put him in possession. Antigonus, however, disregarded the order, and Leontnius in vain attempted to induce Eumenes to accompany him to Europe and share in his far-reaching designs. Eumenes, who was installed in Cappadocia. When Craterus and Antipater, having retired to Greece, determined to pass into Asia and overthrow the power of Perdiccas, their first blow was aimed at Cappadocia. Craterus and Neoptolemus, satch of Armenia, were completely defeated by Eumenes (321); Neoptolemus was killed, and Craterus died of his wounds. After the murder of Perdiccas in Egypt by his own soldiers, the Macedonian generals condemned Eumenes to death, and charged Antipater and Antigonus with the execution of their order. Eumenes, being defeated through the treachery of one of his officers, fled to Nora, a strong fortress on the confines of Cappadocia and Lycaonia, where he defended himself for more than a year. The death of Antipater (310) produced complications. He left the regency to his friend Polyperchon over the head of his son Cassander, who entered into an alliance with Antigonus and Ptolemy against Polyperchon, supported by Eumenes, who, having escaped from Nora, was threatening Syria and Phoenicia. In 318 Antigonus marched against him, and Eumenes withdrew east to join the satraps of the provinces beyond the Tigris. After two indecisive battles in Iran, Eumenes was betrayed by his own soldiers to Antigonus and put to death. He was an able soldier, who did much to maintain the unity of Alexander's empire in Asia; but his efforts were frustrated by the generals and satraps, who hated and despised the "secretary" and "foreigner."

See Plutarch, Eumenes; Cornelius Nepos, Eumenes; Dio, xvi., xix.; Arrian, Anabasis, vii.; Quintus Curtius x. 4; Justin viii. 81; A. Verin, Eumenes von Kartha. Ein Beitrag zur Geschichte der Diadochenzeit (Münster i., W., 1907). Also Macedonian Empire.

EUMENIDES (from Gr. eu' ménides, kindly; eu', well, and ménôs, disposition), the "kindly ones," a eulogyism for the Phrygians or Erinnyes (q.v.). They give their name to a famous play by Aeschylus (q.v.), written in glorification of the old religion and aristocratic government of Athens, in opposition to the new democracy of the Periclean period.

EUMENIUS (c. A.D. 260–311), one of the Roman panegyrists, was born at Augustodunum (Autun) in Gallia Lugdunensis. He was of Greek descent; his grandfather, who had migrated from Athens to Rome, finally settled at Autun as a teacher of rhetoric. Eumenes probably took his place, for it was from Autun that he went to be magister memoriae (private secretary) to Constantius Chlorus, whom he accompanied on several of his campaigns. In 266 Chlorus determined to restore the famous schools (scholae Maeniana) of Autun, which had been greatly damaged by the inroads of the Bagaudae (peasant banditti), and appointed Eumenes to the management of them, allowing him to retain his offices at court and doubling his salary. Eumenes generously gave up a considerable portion of his endowments to the improvement of the schools. There is no doubt that Eumenes was a heathen, not even a nominal follower of Christianity, like Antonius, and other writers from Gaul. Notwithstanding his advancement in his later years, he was at least till 311, if the Gratiarum Actio to Constantine is by him. Of the twelve discourses included in the collection of Panegyrici Latini (ed. E. Bähr, 1874), the following are probably by Eumenes. (1) Pro restorationi (or instaurandi) scholis, delivered (297) in the forum at Autun before the governor of the province. Its chief object is to set forth the steps necessary to restore the schools to their former state of efficiency, and the author lays stress upon the fact that he intends to assist the good work out of his own pocket. (2) An address (307) to the Caesar Constantius Chlorus, congratulating him on his victories over Allectus and Carausius in Britain, and containing information of some value as to the British methods of fighting. (3) A panegyric on Constantine (310). (4) An address of thanks (311) from the inhabitants of Autun (whose name had been changed from Augustodunum to Flavia) to Constantine for the remission of taxes and other benefits. (5) A festal address (327) on the marriage of Constantine and Fausta, the daughter of Maximin. All these speeches, with the exception of (1), were delivered at Autun, and, except the Horatian (Tolove), whose birthday is celebrated in (3), Eumenes is far the best of the orators of his time, and superior to the majority of the writers of imperial panegyrics. He shows greater self-restraint and moderation in his language, which is simple and pure, and on the whole is free from the gross flattery which characterizes such productions. This fault is most conspicuous in (3), which led Heyne (Opuscula, vi. 80) to deny the authorship of Eumenes on the ground that it was unworthy of him.
There are treatises on Eumenuis by B. Kilian (Würzburg, 1869), S. Brandt (Freiburg im Breisgau, 1882), and H. Schaas (Halle, 1885); see also Gaston Boissier, "Les Rêvètes gauloises du IVe siècle," in Journal des savants (1884).

EUMOLPUS ("sweet singer"), in Greek mythology, son of Poseidon and Chione, the daughter of Boreas, legendary priest, poet and warrior. He finally settled in Thrace, where he became king. During a war between the Eleanians and Athenians under Erechtheus, he went to the assistance of the former, who on a previous occasion had shown him hospitality; but was slain with his two sons, Phorbas and Immaradus. According to another tradition, Erechtheus and Immaradus lost their lives; the Eleanians then submitted to Athens on condition that they alone should celebrate the mysteries, and that Eumolpus and the daughters of Celeus should perform the sacrifices. It is asserted by others that Eumolpus with a colony of Thracians laid claim to Attica as having belonged to his father Poseidon (Isocrates, Panath. 193). The Eleanian mysteries were generally considered to have been founded by Eumolpus, the first priest of Demeter, but, according to some, by Eumolpus the son of Musaeus, Eumolpus the Thracian being the father of Keryx, the ancestor of the priestly family of the Keryikes. As priest, Eumolpus purifies Héraclès from the murder of the Centaurs; as musician, he instructs him (as well as Linus and Orpheus) in playing the lyre, and is the reputed inventor of vocal accompaniments to the flute. Suidas reckons him one of the early poets and a writer of hymns of consecration, and Diodorus Siculus quotes a line from a Dionysiac hymn attributed to Eumolpus. His orchestra is said to have been the first priest of Dionysus, and to have introduced the cultivation of the vine and fruit trees (Pliny, Nat. Hist. vii. 190). His grave was shown at Athens and Eleusis. His descendants, called Eumolpidæ, together with the Keryikes, were the hereditary guardians of the mysteries (q.v.).

See Apollodorus ii. 5, iii. 15; Pausanias i. 38. 2; Hyginus, Fab. 273; Homeric Hymn to Demeter, 475; Strabo vii. p. 321; Dios. Sic. i. 11; article "Eumolpidæ," by J. A. Hild in Dabereyn and Sayglo's Dictionnaire des antiquités.

EUNAPIUS, Greek sophist and historian, was born at Sardis, A.D. 347. In his native city he was under the relative the sophist Chrysanthus, and while still a youth went to Athens, where he became a favourite pupil of Proserius the rhetorician. He possessed a considerable knowledge of medicine. In his later years he seems to have resided at Athens, teaching rhetoric. Initiated into the Eleusinian mysteries, he was admitted into the college of the Eumolpidæ and became hierophant. There is evidence that he was still living in the reign of the younger Theodosius (408–430). Eunapius was the author of two works, one entitled Lives of the Sophists (Bia. philosophow kai sophistow), and the other consisting of a continuation of the history of Dexippus (q.v.). The former work is still extant; of the latter only extracts remain, but the facts are largely incorporated in the work of Zosimus. It embraced the history of events from A.D. 270–404. The Lives of the Sophists, which deals chiefly with the contemporaries of the author, is valuable as the only source for the history of the neo-Platonism of that period. The style of both works is bad, and they are marked by a spirit of bitter hostility to Christianity. Photius (cod. 77) had before him another history of the Sophists which the passages most offensive to the Christians were omitted.

EUNOMIUS (d. c. 393), one of the leaders of the extreme or "anomoean" Arians, who are sometimes accordingly called Eunomians, was born at Dacora in Cappadocia early in the 4th century. He studied theology at Alexandria under Aetius, and afterwards came under the influence of Eudoxios of Antioch, where he was ordained deacon. On the recommendation of Eudoxios he was appointed bishop of Cyzicus in 360. Here his free utterance of extreme Arian views led to popular complaints, and Eudoxios was compelled, by command of the emperor, Constantius II., to depose him from the bishopric within a year of his elevation to it. During the reigns of Julian and Joan, Eunomius resided in Constantinople in close intercourse with Aetius, consolidating an heretical party and consecrating schismatical bishops. He then went to live at Chalcedon, whence in 367 he was banished to Mauretania for harbouring the rebel Procopius. He was recalled, however, before he reached his destination. In 383 the emperor Theodosius, who had demanded a declaration of faith from all party leaders, punished Eunomius for continuing to teach his distinctive doctrines, by banishing him to Hismyria in Moesia. He afterwards resided at Chalcedon and at Caesarea in Cappadocia, from which he was expelled by the inhabitants for writing against their bishop Basil. His last days were spent at Dacora his birthplace, where he died about 393. His writings were held in high reputation by his party, and their influence was so much dreaded by the orthodox, that more than one imperial edict was issued for their destruction (Cod. Theod. xvi. 34). Consequently his commentary on the epistle to the Romans, mentioned by the historian Socrates, and his epistles, mentioned by Philostorgius and Photius, are no longer extant. His first apologetic work (Apologeticon), written probably about 360 or 365, has been extant, recently recovered, the celebrated translation of Iazyg Basil, and may be found in F. Fabrius, Bibl. Gr. vii. pp. 262–305. A second apology, written before 379 ("Opus unctiones unctiones"), exists only in the quotations given in it in a refutation by Gregory of Nyssa. The exposition of faith (Euseb. E.A. 152), called forth by the demand of Theodosius, is still extant, and has been edited by Valesius in his notes to Socrates, and by Ch. H. G. Rettberg in his Marcelliana.

The teaching of the Anomoean school, led by Aetius and Eunomius, starting from the conception of God as δ ἀγνωνόμον, argued that between the ἀγνωνόμον and γνωνόμον there could be no essential, but at best only a moral, resemblance. “As the Unbegotten, God is an absolutely simple being; an act of generation would involve a contradiction of His essence by introducing duality into the Godhead.” According to Socrates (v. 24), Eunomius carried his views to a practical issue by altering the baptismal formula. Instead of baptizing in the name of the Trinity, he baptized in the name of the Creator and into the death of Christ. This alteration was regarded by the orthodox as so serious that Eunomians on returning to the church were rebaptized, though the Arians were not. The Eunomian heresy was formally condemned by the council of Constantinople in 381. The sect maintained a separate existence for some time, but gradually fell away owing to internal divisions.

See C. R. W. Klose, Geschichte und Lehre des Eunomius (Kiel, 1833); F. Loofs in Hauck-Herzog, Realencyk. für prot. Theol.; Whiston’s Eunomianismus redux contains an English translation of the first apology. See also ARIUS.

EUNUCH (Gr. ἐνυκος), an eunomous male. From remote antiquity among the Orientals, and as also at a later period in Greece, eunuchs were employed to take charge of the women, or generally as chamberlains—whence the name of ἐνυκος ἐφοριος, i.e. those who have charge of the bed-chamber. Their confidential position in the harems of princes frequently enabled them to exercise an important influence over their royal masters, and even to raise themselves to stations of great trust and power (see HAREM). Here the term eunuch came to be applied in Egypt to any court officer whether a castrator or not. The common idea that eunuchs are necessarily deficient in courage and in intellectual vigour is amply refuted by history. We are told, for example, by Herodotus that in Persia they were especially prized for their fidelity; and they were frequently promoted to the highest offices. Narse, the famous general under Justinian, was a eunuch, as was also Hermias, governor of Atarnea in Mysia, to whose names the great Aristotle offered sacrifices, besides celebrating the praises of his patron and friend in a poem (still extant) addressed to Virtue (see Lucian’s dialogue entitled Eunuchus). The capacity of eunuchs for public affairs is strikingly illustrated by the histories of Persia, India and China; and considerable power was exercised by the eunuchs under the later Roman emperors. The hideous trade of castrating boys to be sold as eunuchs for Moslem harems has continued
EUNUCH FLUTE—EUPATRIDAe

891
to modern times, the principal district whence they are taken being north-central Africa (Bagirmi, &c.). As the larger proportion of children die after the operation generally total removal) owing to unskilled surgery, such as recovery expected at least three or four times the ordinary price of slaves. Even more vile, as being practised by a civilized European nation, was the Italian practice of castrating boys to prevent the natural development of the voice, in order to train them as adult soprano singers, such as might formerly be heard in the Sistine chapel. Though such mutilation is a crime punishable with severity, the supply of “soprani” never failed so long as their musical powers were in demand in high quarters. Driven long ago from the Italian stage by public opinion, they remained the musical glory and moral shame of the papal choir till the accession of Pope Leo XIII., one of whose first acts was to get rid of them. Mention must here also be made of the class of voluntary eunuchs, who have emasculated themselves, or caused the operation to be performed on them, for the avoidance of sexual sin or temptation. This unnatural development of asceticism appears in early Christian ages, its votaries acting on the texts (Matt. xix. 12, v. 28-30, the former case is the most celebrated example, and by an old writer probably there had arisen a sect of eunuchs, of whom Augustine says (De haeres. c. 37), “Valesii et seipos castrant et hospites suos, hoc modo existimantes Deus de se debere servit.” (see Neander, History of Chr. Church, vol. ii. p. 462: Bingham, Antiq. Chr. Church, book iv. chap. 3.) Such practices have been always opposed by the general body of the Christian churches, but they have not even now ceased. A secret sect of the kind exists in Russia, whose practice of castration is expressed in their name of Skopzi.

EUNUCH FLUTE, or ONION FLUTE (Fr. flûte eunuque, flûte d’hom, mirliton; Ger. Zwiebelflöte), a wind instrument in use during the 16th and 17th centuries, producing music akin to the comb-music of the nursery, and still manufactured as a toy (mirlton). The onion flute consists of a wooden tube widening out slightly to form a bell. The upper end of the tube is closed by means of a very fine membrane similar to an onion skin stretched across the aperture like the vellum of a drum. The mouthpiece, a simple round hole, is pierced a couple of inches below the membrane; into this hole the performer sings, his voice setting up vibrations in the membrane, which thus intensifies the sound and changes its timbre to a bleating quality. A movable cap fits over the membrane to protect it. Mersenne has given a drawing of the eunuch flute together with a description; he states that the vibrations of the membrane improve the sound of the voice, and by reflecting it, give it an added charm. There were concerts of these flutes in four or five parts in France, adds Mersenne, and they had the advantage over other kinds of reproducing more nearly the sound of the voice.

EUONYMUS, in botany, a genus of deciduous or evergreen shrubs or small trees, widely distributed in the northern temperate zone, and represented in Britain by E. europaeus, the spindle tree, so called from its hard tough wood being formerly used for spindles. It is a shrub or small tree growing in copses or hedges, with thin leaves and small white flowers, followed by black, smooth, two-seeded berries. The ripe fruit is a pale crimson colour and splits into four lobes exposing the bright orange-coloured seed. E. japonicus is a hardy evergreen shrub, often variegated and well known in gardens. The Greek name ἐυώνυμος, of good name, lucky, is probably a euphemism; the flowering was said to foretell plague.

EUPALINUS, of Megara, a Greek architect, who constructed for the tyrant Polycrates of Samos a remarkable tunnel to bring water to the city, passing under a hill. This aqueduct still exists, and is one of the most remarkable constructions in Greece (see AQUEDUCT: Greek).

EUPATORIA (Russ. Eupoloria; also known as Kaolov and to the Turks as Gelev), a seaport of Russia, in the government of Taurida, on the W. coast of the Crimea, 30 m. N.W. of Sinope, on a sandy promontory on the north of Kalamita Bay, in 45° 1' N. and 33° 40' E. Pop. (1872) 8294; (1897) 17,051. This number includes many Jews, the Karaite sect having here their principal synagogue. Here too resides the spiritual head (gabbhan) of the sect.

Of its numerous ecclesiastical buildings three are of interest—the synagogue of the Karaite Jews; one of the mosques, which has fourteen cupolas and is built (1552) after the plan of St Sophia in Constantinople; and the Greek Catholic cathedral (1898). The port or rather roadstead has a sandy bottom, and is exposed to violent storms from the N.E. The trade is principally in cereals, skins, cow-hair, felt, tallow and salt. Eupatoria has some repute as a sea-bathing resort.

According to some authorities it was near this spot that a military post, Eupatorius, was established in the 1st century A.D. by Diophantus, the general of Mithradates the Great, king of Pontus. Towards the end of the 15th century the Turks built the fortress of Gezelve on the present site, and it became the capital of a khante. It was occupied by the Russians under Marshal Münnich in 1736, and in 1771 by Prince Dolgoroukov. Its annexation to Russia took place in 1783. In 1854 the Anglo-French troops were landed in the neighbourhood of Eupatoria, and in February 1855 the town was occupied by the Turkish forces.

EUPATRIDAe (Gr. εὐπατρία, well; πατρος, father, i.e. “Sons of noble fathers”), the ancient nobility of Attica. Tradition ascribes to Theseus, whom it also regards as the author of the union (symbiosis) of Attica round Athens as a political centre, the division of the Attic population into three classes, Eupatridae, Geomori and Demiurgi. The lexicographers mention as characteristics of the Eupatridae that they are the autochthonous population, the dwellers in the city, the descendants of the royal stock. It is probable that after the time of the symbiosis the nobles who had hitherto governed the various independent communities were obliged to reside in Athens, now the seat of government; and at the beginning of Athenian history the noble clans form a class which has the monopoly of political privilege. It is possible that in very early times the Eupatridae were the only full citizens, and it is generally assumed that they alone belonged to the phratries, and the elements into which the nobles must have covered the whole citizen body. It is indeed just possible that the term may originally have signified “true member of a clan,” since membership of a phratri was a characteristic of each clan (γένος). It is not probable that the Eupatrid families were all autochthonous, even in the loose sense of that term. Some had no doubt immigrated to Attica when the rest had long been settled there. Traces of this union of immigrants with older inhabitants have been detected in the combination of Zeus Herakles with Apollo Patroos as the ancient gods of the phratries.

The exact relation of the Eupatridae to the other two classes has been a matter of dispute. It seems probable that the Eupatridae were the governing class, the only recognized nobility, the Geomori the country inhabitants of all ranks, and the Demiurgi the commercial and artisan population. The division attributed to Theseus is always spoken of by ancient authorities as a division of the entire population; but Busolt has recently maintained the view that the three classes represent three elements in the Attic nobility, namely, the city nobility, the landed nobility and the commercial nobility, and exclude altogether the mass of the population. At any rate it seems certain from the little we know of the early constitutional history of Athens, that the Eupatridae represent the only nobility that had any political recognition in early times. The political history of the Eupatridae is that of a gradual curtailment of privilege. They were at the height of their power in the period during the limitation of the monarchy. They alone held the two offices, those of polemarch and archon, which were instituted during the 8th century B.C. to restrict the powers of the kings. In 712 B.C. the office of king (βασιλεύω): was itself thrown open to all Eupatrids (see ARCHON). They thus had the entire control of the administration, and were the sole dispensers of justice in the state. At this latter privilege, which perhaps formed the strongest bulwark of the authority of the Eupatridae, a severe blow was struck (c. 621 B.C.) by the publication of a criminal
code by Draco (q.v.), which was followed by the more detailed and permanent code of Solon (c. 594 B.C.), who further threw open the highest offices to any citizen possessed of a certain amount of landed property (see Solon), thus putting the claims of the Eupatridae to political influence on a level with those of the wealthier citizens of all classes. The most highly coveted office at this time was not that of Baraēs, which, like that of the rex sacrorum in Rome, had been stripped of all its religious authority, but that of the Archon; soon after the legislation of Solon repeated struggles for this office between the Eupatridae and leading members of the other two classes resulted in a temporary change. Ten archons were appointed, five of whom were to be Eupatridae, three Agroeci (i.e. Geomori), and two Demiurgi (Arist. Ath. Pol. xiii. 2). This arrangement, though short-lived, is significant of the decay of the political influence of the Eupatridae, and it is not likely that they recovered, even in practice, any real control of the government. By the middle of the 6th century the political influence of birth was at an end.

The name Eupatridae survived in historical times, but the Eupatridae were then excluded from the cult of the "Sennae" at Athens, and also held the hereditary office of exponent of the grove of Athena (Cypris) in connection with purification for the removal of the overarching of the fourth archon. The combination of these two characteristics suggests some connexion with the legend of Orestes. Again, Isocrates (evi. 25) says of Alcibiades that his grandfather was a Eupatrid and his grandmother an Alcaemoneid, which suggests that in the 6th century the Eupatrids were a single clan, like the Alcaemoniids, and that the name had acquired a new signification. A pursuit of these two suggestions has established the probability that this "Eupatrid" clan traced its origin to Orestes, and derived its name from the hero, who was above all a benefactor of his father. The word will well bear this sense in the two passages in which Sophocles (Electra, 162, 859) applies it to Orestes; and it is likely enough that after the disappearance of the old Eupatridae as a political corporation, the name was adopted in a different sense, but not without a claim to the distinction inherent in the older sense, by one of the oldest of the clans.

Eupen (Fr. Neu), a town of Germany, in the Prussian Rhine province, in a beautiful valley at the confluence of the Helle and Vësdr, 9 m. S. of Aix-la-Chapelle by rail. Pop. (1905) 14,297. It is a flourishing commercial place, and besides cloth and buckskin mills it has net and glove manufactories, soapworks, dyeworks, tanneries and breweries, and also carries on a considerable trade in cattle and dairy produce. It has a Protestant and a Roman Catholic church, a Franciscan monastery, a progonnasmus, an orphanage, a hospital, and a chamber of commerce. As part of the duchy of Limburg, Eupen was under the government of Austria until the peace of Lunéville in 1801, when it passed to France. In 1814 it came into the possession of Prussia.

EuphemiSm (from Gr. ἐφθασε, having a sound of good omen; ἐφι, well, and φων, sound or voice), a figure of speech in which an unpleasant or coarse phrase is replaced by a softer or less offensive expression. A euphemism has sometimes a metaphorical sense, as in the substitution of the word "sleep" for "death.

EuphoniUm (Fr. baryton; Ger. Tenor Tube), a modern brass wind instrument, known in military bands as euphonium and in the orchestra as tuba. The euphonium consists of a brass tube with a conical bore of wide calibre ending in a wide-mouthed bell; it is played by means of a cup-shaped mouthpiece. The sound is produced as in the bombardon, which is the bass of the euphonium, by the varied tension of the lips across the mouth-

1 For a discussion of this see Archon.

The interlocking notes of the chromatic scale are obtained by the use of valves or pistons usually four in number, which, by opening a passage into additional lengths of tubing lower the pitch one, half, one-and-a-half, and two-and-a-half tones (see Bombardon; Tuba; Valves). The euphonium gives out the fundamental, or first note of the harmonic series, readily, but no harmonic above the eighth. Euphoniums are made in G and in B, the latter being more generally used. By means of all the valves used at once, the B, an octave below the fundamental, can be reached, giving a compass of four octaves, with chromatic intervals. The bass clef is used in notation. The euphonium is treated by French and German composers as a transposing instrument; in England the real notes are usually written, except when the treble clef is used. The quality of tone is rich and full, harmonizing well with that of the trombone. The euphonium speaks readily in the lower register, but slowly, of course, according to the length of the tubes. Messrs Rudall Carte have removed this difficulty by their patent short action pistons, which have but half the dip of the old pistons. On these instruments it is easy to execute rapid passages.

The euphonium is frequently said to be a saxhorn, corresponding to the baryton member of that family, but the statement is misleading. The bombardon and euphonium, like the saxhorns, are the outcome of the application of valves to the bugle family, but there is a radical difference in construction; the tubas (bombardon and euphonium) have a conical bore of sufficiently wide calibre to allow of the production of the fundamental harmonic, which is absent in the saxhorns. The Germans classify brass wind instruments as whole and half according to whether, having the wide bore of the bugle, the whole length of the tube is available and gives the fundamental proper to an organ pipe of the same length or whether by reason of the narrow bore in proportion to the length, only half the length of the instrument is of practical utility, the harmonic series beginning with the second harmonic. (See Bombardon.)

Euphorbiaceae, in botany, a large genus of plants from which the word Euphorbiaceae is derived. It includes more than 600 species and is of almost world-wide distribution. It is represented in Britain by the spurge—small, generally smooth, herbaceous plants with simple leaves and inconspicuous flowers arranged in small cup-like heads (cyclothia). The cyathium is a characteristic feature of the genus, and consists of a number of male flowers, each reduced to a single stamen, surrounding a central female flower which consists only of a stalked pistil; the group of flowers is enveloped in a cup formed by the union of four or five bracts, the upper part of which bears thick, conspicuous, gland-like structures, which in exotic species are often brilliantly coloured, giving the cyathium the appearance of a single flower. Another characteristic is the presence of a milky juice, or latex, in the tissues of the plant. In one section of the genus the plants resemble cacti, having a thick succulent stem and branches with the leaves either very small or completely reduced to a small wart-like excrescence, with which is generally associated a tuft of spines (a reduced shoot). These occur in the warmer parts of the world as a type of dry country or desert vegetation. The only species of note are E. fugax and E. jacquinioiieora, for the warm greenhouse; E. Cyperis (the Cypress spurge), E. Wulfenii, E. Lathyris and E. Myristines, for the open air.

Euphorbiaceae, in botany, a large natural order of flowering plants, containing more than 250 genera with about

1 See Dr Schafhautl's article on "Musical Instruments" in sect. iv. of Bericht der Beurtheilungs-Commission bei der Allg. deutschen Industrie Ausstellung (Munich, 1854), pp. 160-170; also Fried. Zam-
4000 species, chiefly tropical, but spreading over the whole earth with the exception of the arctic and cold alpine zones. They are represented in Britain by the spurge (Euphorbia, q.v.) (fig. 1) and dog's mercury (Mercurialis) (fig. 2), which are herbaceous plants, but the greater number are woody plants and often trees. The large genus Euphorbia shows great variety in habit; many species, like the English spurgs, are annual herbs, others form bushes, while in the desert regions of tropical Africa and the Canary Islands species occur resembling cacti, having thick fleshy stems and leaves reduced to spines. Another large genus, Phyllanthus, contains small annual herbs as well as trees, while in some species the leaves are reduced to scales, and the branches are flattened, forming phylloclades. The leaves also show great variety in form and arrangement, being simple and entire as in the English spurgs, or deeply cut as in Ricinus (castor-oil) (fig. 3), and Manihot or sometimes palmately compound (Hevea). The majority contain a milky juice or latex in their tissues which exudes on cutting or bruising. In Hevea, Manihot and others the latex yields caoutchouc. The flowers are unisexual; male and female flowers are borne on the same, as in the spurgs (fig. 1), or on different plants, as in dog's mercury (fig. 2). Their arrangement shows considerable variation, but the flowers are generally grouped in crowded definite partial inflorescences, which are themselves arranged in spikes or stand in the axils of the upper leaves. These partial inflorescences are generally unisexual, the male often containing numerous flowers while the female flowers are solitary. The partial inflorescence (cyathium) of Euphorbia (fig. 1) resembles superficially a hermaphrodite flower. It contains a central terminal flower, consisting of a naked pistil; below this are borne four or five bracts which unite to form a cup-shaped involucre resembling a calyx; each of these bracts subtends a small cyme of male flowers each consisting only of one stamen. Between the segments of the cup are large oval or crescent-shaped glands which are often brightly coloured, forming petal-like structures.

The form of the flower shows great variety. The most complete type occurs in Wielandia, a shrub from the Seychelles Islands, in which the flowers have their parts in fives, a calyx and corolla being succeeded in the male flower by 5 stamens, in the female by 5 carpels. Generally, however, only 3 carpels are present, as in Euphorbia; Mercurialis (fig. 2) has minute apetalous flowers with 3 sepals, followed in the male by 8 to 20 stamens, in the female by a bacarpellary pistil. In the large tropical genus Croton a pentamorous calyx and corolla are generally present, the stamens are often very numerous, and the female flower has three carpels. In Manihot, a large tropical American genus to which belongs the manioc or cassava (M. utilissima), the calyx is often large and petaloid. In a great many genera the corolla is absent. The most reduced type of flower is that described in Euphorbia, where the male consists of one stamen separated from its pedicel by a joint, and the female of a naked tricarpellary pistil. The stamens are sometimes more or less united (monadophous), and in castor-oil (Ricinus) (fig. 3) are much branched. The ovary generally contains three chambers, and bears three simple or more often bipartite styles; each chamber contains one or two pendulous ovules, which generally
bear a cap-like outgrowth or corollae, which persists in the seed (well shown in castor oil, fig. 3). As the stamens and pistil are borne by different flowers, cross-fertilization is necessary. In *Mercurialis* and others with inappreciable flowers pollination is effected by the wind, but in many cases insects are attracted to the flower by the highly-bracted, as in *Euphorbia* and *Dalechampia*, or by the colored calyx as in *Manihot*; the presence of honey is also frequently an attraction, as in the honey-glands on the bracts of the cyathium of *Euphorbia*. The fruit is generally a capsule which splits into three divisions (coccii), separating from the central column, and splitting lengthwise into two valves. In the mancinill (*Hippomane mancinella*) of Central America the fruit is a drupe like a plum, and in some genera berries occur. In the sandbox tree (*Hura crepians*) of tropical America the ovary consists of numerous carpels, and forms when mature a capsule which splits with great violence and a loud report into a number of woody cocci. The seeds contain abundant endosperm and a large straight or bent embryo.

Several members of the order are of economic importance.

euphorbene, C_{20}H_{36}O or C_{20}H_{42}O. Pliny states that the name of the drug was given to it in honour of Euphorbus, the physician of Juba II., king of Mauretania. In former times euphorbium was valued in medicine for its drastic, purgative and emetic properties.

**EUPHORBUS**, son of Panthoites, one of the bravest of the Trojan heroes, slain by Menelaus (*Iliad*, xvii. 1-60). Pythagoras, in support of his doctrine of the transmigration of souls, declared that he had once been this Euphorbus, whose shield, hung up in the temple of Argos by Menelaus, he claimed as his own (Horace, *Odes*, i. 28. 11; *Diog. Laërt.* viii. 1).

**EUPHORION**, Greek poet and grammarian, born at Chalcis in Euboea about 275 B.C. He spent much of his life in Athens, where he amassed great wealth. About 221 he was invited by Antiochus the Great to the court of Syria. He assisted in the formation of the royal library at Antioch, of which he held the post of librarian till his death. He wrote mythological epics, amatory elegies, epigrams and a satirical poem (*Apyd, "curses") after the manner of the *Ibis* of Callimachus. Frowe works on antiquities and history are also attributed to him. Like Lyco-

Fig. 3.—Castor Oil (*Ricinus communis*). End of shoot with flower-
spike; about 3 nat. size.

1. Section of male flower, about 5 nat. size.
2. Group of stamens and pistil; sections of seed showing embryo in position.

*Manihot utilissima*, manioc or cassava (q.v.), is one of the most important tropical food-plants, its thick tuberous root being rich in starch; it is the source of Brazilian arrowroot. Caoutchouc or India-rubber is obtained from species of *Hevea*, *Maba*, *Manihot* and *Sapum*. Castor oil (q.v.) is obtained from the seeds of *Ricinus communis*. The seeds of *Aleurites moluccana* and *Sapum sebiferum* also yield oil. Resin is obtained from species of Croton and *Euphorbia*. Many of the species are poisonous; e.g. the South African *Toxicocladron* is one of the most poisonous plants known. Many, such as *Euphorbia, Mercurialis, Croton, Jatropha, Tragia*, have been, or still are, used as medicines. Species of *Codiaeum* (q.v.), *Croton, Euphorbia, Phyllanthus, Jatropha*, and others are used as ornamental plants in gardens.

The box (*Buxus*) and a few allied genera which were formerly included in Euphorbiaeae are now generally regarded as forming a distinct order—Buxaceae, differing from Euphorbiaceae in the position of the ovule in the ovary-chamber and in the manner of splitting of the fruit.

**EUPHORBIUM**, an acid dull-yellow or brown resin, consisting of the concreted milky juice of several species of *Euphorbia*, cactus-like perennial plants indigenous to Morocco. It dissolves in alcohol, ether and turpentine; in water it is only slightly soluble. It consists of two or more resins and a substance...
EUPHRATES

south-east to its junction with the Murad Su. The Frat, separated by the easy pass of Deve-boyun from the valley of the Araxes (Aras), marks the natural line of communication between northern Persia and the West—a route followed by the nomad Turks, Mongols and Tatars on their way to the rich lands of Asia Minor. It is a rapid river of considerable volume, and below Erzinger is navigable, down stream, for rafts. The southern or eastern and longer arm, called by the Turks Murad Su (Ar-sanias Fl.; Armenian, Aradsani; Arab. Naher Arasans), rises south-west of Diadin, in the northern flank of the Ala Dagh (11,500 ft.), and flows west to the Alashgird plain. Here it is joined by the Sharian Su (Teleboas), which, rising near Lake Van, runs past Mush and waters the plain. The river now runs W.S.W. through a deep rocky gorge, in which it receives the Gunig Su (right), to Palu (where there are cuneiform inscriptions, and statues of gods, etc.). Beyond the Frat, the river rises and joins the Frat Su. About 10 m. E.N.E. of Kharput the Murad Su is joined by its principal tributary, the Peri Su, which drains the wild mountain district, Dersim, that lies in the loop between the two arms. The Murad Su is of greater volume than the Frat, but its valley below Mus is contracted and followed by no great road. Below the junction of the two arms the Euphrates flows south-west past the lead mines of Kebar Maden, where it is 120 yds. wide, and is crossed by a ferry (altitude, 2425 ft.), on the Sivas-Kharput road. It then runs west, south and east round the rock-mass of Musher Dagh, and receives (right) the Kuru Chai, down which the Sivas-Malatia road runs, and the Tokhma Su, from Gorun (Gourain) and Dandre. At the ferry on the Malatia-Kharput road (cuneiform inscription) it flows eastwards in a valley about a quarter of a mile wide, but soon afterwards enters a remarkable gorge, and forces its way through Mount Taurus in a succession of rapids and cataracts. After running south-east through the grandest scenery, and closely approaching the source of the western Tigris, it turns south-west and leaves the mountains a few miles above Samsat (Samosata; altitude, 1500 ft.). The general direction of the great gorges of the Euphrates, Pyramus (Jihun) and Sarus (Sihun) seems to indicate that their formation was primarily due to the same terrestrial movements that produced the Jordan-Abra depression to the south. The length of the Frat is about 275 m.; of the Murad, 415 m.; and of the Euphrates from the junction to Samsat, 115 m.

Middle Division.—The middle division, which extends from Samsat to Hit, is about 720 m. long. In this part of its course the Euphrates runs through an open, treeless and sparsely peopled country, in a valley a few miles wide, which it has eroded in the rocky surface. The valley bed is more or less covered with alluvial soil, and cultivated in places by artificial irrigation. The method of this irrigation is peculiar. Three or four piers or sometimes bridges of masonry are run out into the bed of the river, frequently from both sides at once, raising the level of the stream and thus giving a water power sufficient to turn the gigantic wheels or wheels, sometimes almost 40 ft. in diameter, which lift the water to a trough at the top of the dam, whence it is distributed among the gardens and melon patches, rice, cotton, tobacco, liquorice and durra fields, between the immediate bed of the river and the rocky banks which shut it out from the desert.

The wheels, called naoura, are of the most primitive construction, made of rough branches of trees, with palm leaf paddles, rude clay vessels being slung on the outer edge to catch the water, of which they raise a prodigious amount, only a comparatively small part of which, however, is poured into the aqueducts on top of the dams. These latter are exceedingly picturesque, often consisting of a series of well-built Gothic arches, and give a peculiar character to the scenery; but they are also great impediments to navigation. In some parts of the river 300 naoura have been counted within a space of 130 m., but of late years many have fallen into decay. By far the larger part of the valley is quite uncultivated, and much of it is occupied by tamarisk jungles, the home of countless wild pigs. Where the valley is still cultivated, the jerd, a skin raised by oxen, is gradually being substituted for the naoura, no more of the latter being constructed to take the place of those which fall into decay.

In this part of its course the rocky sides of the valley, which sometimes closely approach the river, are composed of marls and gypsum, with occasional selenite, overlaid with sandstone, with a topping of breccia or conglomerate, and rise at places to a height of 200 ft. or more. At one point, however, 26 m. above Deir, where lie the ruins of Halebiya, the river breaks through a basaltic dike, el-Flame, some 300 to 500 ft. high. On either side of the river valley a steppe-like desert, covered in the spring with verdure, the rest of the year barren and brown, stretches away as far as the eye can see. Anciently the country on both sides of the Euphrates was habitable as far as the river Khabur; at the present time it is all desert from Birejik downward, the camping ground of Bedouin Arabs, the great tribe of Anazeh occupying el-Skheim, the right bank, and the Shammar (Hrhomla) the left. Many of the Memo, Romans, now called el-Jezeireh or the island. To these the semi-sedentary Arabs who sparsely cultivate the river valley, dwelling sometimes in huts, sometimes in caves, pay a tribute, called kubb, or brotherhood, as do also the riverain towns and villages, except perhaps the very largest. The Turkish government also levies taxes on the inhabitants of the river valley, and for this purpose, and to maintain a caravan route from the Mediterranean coast to Bagdad, maintains stations of a few zaptiehs or gens d’armes, at intervals of about 8 hours (caravan time), occupying in general the stations of the old Persian post road. The only riverain towns of any importance on this stretch of the river to-day are Samsat, Birejik, Deir, ‘Ana and Hit.

In early times the Euphrates was important as a boundary. It was the theoretical eastern limit of the Jewish kingdom; for a long time it separated Assyria from the Khita or Hitittites; it divided the eastern from the western satrapies of Persia (Era iv. 17; Neh. ii. 7); and it was at several periods the boundary of the Roman empire. Until the advent of the nomads from central Asia, and the devastation of Mesopotamia, and the opposite Syrian shore of the river, there were many flourishing cities along its course, the ruins of which, representing all periods, still dot its banks. Samsat itself represents the ancient Samosata, the capital of theSeleucid kings of Commagene (Kumukh of the Assyrian inscriptions), and here the Persian Royal Road from Sardis to Susa is supposed to have crossed the river. Below Samsat the river runs S.W. to Rum-Kaleh, or "castle of the Romans" (Armenian, Hrhomgla). At this point was another passage of the river, defended by the castle which gives its name to the spot, and which stands on a high hill overlooking the right bank, its base washed by an abundant stream, the Sanjeh (Gr. Σαγγή), which enters the Euphrates on the west. From this point the river runs rather east of south for about 25 m. past Khafad (ferry) to Birejik or Bir, the ancient Bithra, where it is only 110 m. from the Mediterranean, the bed of the river being 62½ ft. above that sea. This was the Apamea-Zeugma, where the high road from east to west crossed the river, and it is said to have been one of the most frequented of all the passages into Mesopotamia, being the regular caravan route from Iskenderun and Aleppo to Urfa, Diarbekr and Musol. From Birejik the river runs sluggishly, first a little to the east, then a little to the west of south, over a sandy or pebbly bed, past Jerabalus (Europus, Carcimish, the ancient Hittite capital), near which the Sajur (Sagara; Sangar of the Assyrian inscriptions) enters the west, to Meske, 2 m. southward of which are the ruins of Barbalissus (Arab. Baltis), the former port of Aleppo, now, owing to changes in the bed, some distance from the water. Six miles below this the ruins of Kal’at Dibse mark the site of the ancient Thapsacus (Tiphsah of 1 Kings iv. 24), the most important passage of the middle Euphrates, where both Cyrus, on his expedition against his brother, and Alexander the Great crossed.
that river, and the ancient port of Syria. Here the river turns quite sharply eastward. A day's journey beyond Maskene are the remains of Siliun (Roman Sephe), where Moawiyah defeated the caliph Ali in 657 (see CALLIPHATE), and opposite this, on the west bank, a picturesque ruin called Kal'at Ja'ber (Dawara). A day's journey beyond this, on the Syrian side, stand the remains of ancient Sura, a frontier fortress of the Romans against the Parthians; 20 m. S. of which, inland, lie the well-preserved ruins of Reseph (Assyrian, Ressa or Rasa). Half a day's journey beyond Sura, on the Mesopotamian side of the river, are the extensive ruins of Haragia (Horaclea) and Rakka, once the capital of Harun al-Rashid (Nicephorium of Alexander; Callinicus of the Seleucids and Romans). Here the Belikh (Bileschas) joins the Euphrates, flowing southward through the biblical Aram Naharaim from Urfa (Edessa) and Harran (Carrhae); and from this point to el-Kaim four days' below Deir, the course of the river is south-easterly. Two days' journey beyond Rakka, where the Euphrates breaks through the basalt dike of el-Hamme, are two admirably preserved ruins, built of gypsum and basalt, that on the Mesopotamian side called Zelebiya (Chamanga), and that on the Syrian, much the finer of the two, Halebiya or Zenobiya, the ancient Zenobia. Two or six miles farther down lies the Tigris; (q.v.). The Euphrates river divides into branches, and as the river valley opens out into quite extensive plains. Here the roads from Damascus, by way of Palmyra, and from Mosul, by way of the Khabur, reach the Euphrates, and here there must always have been a town of considerable commercial and strategic importance. The region is to-day covered with ruins and ruin mounds. A little below Deir the river is joined by the Khabur (Khebaras, Biblical Khabur), the frontier of the Roman empire from Diocletian's time, which rises in the Karka Dagh; and, with its tributary, the Maghijah (Mydionius; Arab. Hirnas) flows south through the land of Gozan in which Sargon settled the deported Israelites in 721 B.C. At the mouth of the Khabur stood the Roman frontier fortress of Circesium (Assyrian, Sarki; Arab. Kirkesi) now el-Busirea. The corresponding border town on the Syrian side is represented by the picturesque and finely preserved ruins called Salahiya, the Ad-dalite or Dallie (Adaladi) of Arabic times, two days below Deir, whose more ancient name is as yet unknown. Between Salahiya and Deir, on an old canal, known as the long canal, which, before the Deir and rejoining it above Salahiya, stand the almost more picturesque ruins of the once important Arab fortress of Rahba.

As far as the Khabur Mesopotamia seems to have been a well-inhabited country from at least the 15th century B.C., when it constituted the Hitite kingdom of Mitanni, down to about the 12th century A.D., and the same is true of the country on the Syrian side of the Euphrates as far as the eastern limit of the Palmyrene. Below this point the back country on the Syrian side has always been a complete desert. On the Mesopotamian side there would seem, from the accounts of Xenophon and Ptolemy, to have been an affluent which joined the Euphrates between Deir and 'Ana, called Araxes by the former, Sasorcas by the latter; but no trace of such a stream has been found by modern explorers and the country in general has always been uninhabited. Below Salahiya the river-bed narrows and becomes more rocky. A day's journey beyond Salahiya, on a bluff on the Mesopotamian side of the river, are the conspicuous ruins of el-'Tri (Corselet). Half a day's journey beyond, at a point where the river is widest and leaves the Euphrates, on the Syrian side, stands Jahriya, an unidentified ruined town of Babylonian type, with walls of unbaked brick, instead of the stone heretofore encountered. At this point the river turns sharply a little north of east, continuing on that course somewhat over 40 m. to 'Ana, where it bends again to the south-east. Just above 'Ana are rapids, and from this point to Hit the river is full of islands, while the bed is for the most part narrow, leaving little cultivable land between it and the bluffs. 'Ana itself, a very ancient town, of Babylonian origin, once sacred probably to the goddess of the same name, lay originally on several islands in the stream, where ruins, principally of the Arabic and late Persian period, are visible. Here palm trees, which had begun to appear singly at Deir, grow in large groves, the olive disappears entirely, and we have definitely passed over from the Syrian to the Babylonian flora and climate. Between 'Ana and Hit there were annually at least four island cities or fortresses, and at the present time three such towns, insignificant relics of former greatness, Haditha, Alus or el-Uzz and Jibba still occupy the old sites. Of these Alus is evidently the ancient Auzara or Uzzancosystemes, the city of the old Arab goddess 'Uzza; Haditha, an important town under the Abbasids, was earlier known as Baia Malcha; while Jibba has not been identified. The fourth city, Thiluta or Olubas, once occupied the present deserted island of Telbeis, half a day's journey below 'Ana. About half-way between 'Ana and Hit, in the neighbourhood of Haditha, the river has a breadth of 300 yds., with a depth of 18 ft., and a flood speed of 4 knots.

At this point we begin to encounter sulphur springs and bitter streams redolent with bitumen, a formation which reaches its climax at Hit (q.v.), where a small stream (the 'river of Ahava') of Ezra vii. 21 enters the Euphrates from the Syrian side, on which, about 9 m. from its mouth, stands the small town of Kubeita.

In the middle Euphrates, from Samas to Hit, is to-day an avenue of ruins, of which only the more conspicuous or important have been indicated here. It was from a remote period, antedating certainly 3000 B.C., the highway of empire and of commerce between east and west, more specifically between Babylonia and Irak and Syria, and numerous peoples, empires and civilizations have left their records on its shores. Its time of greatest prosperity and importance was the period of the Abbasid caliphate; and Arabic geographers as late as A.D. 1200 mention an astonishingly large number of important cities situated on its shores or islands. The Mongol invasion, in the latter part of that century, wrought their ruin, however, and from that time to the present there has been a steady decline in the commercial importance of the Euphrates route, and consequently also of the towns along its course, until at the present time it is only an avenue of ruins.

Lower Division.—Hit stands almost at the head of the alluvial deposit, about 350 m. from the Persian Gulf, separated from it by a couple of small spurs of the Syrian plateau, and may be said to mark the beginning of the lower Euphrates river. It flows S.E. S.S.E. to its junction with the Tigris below Korna, through an unbroken plain, with no natural hills, except a few sand (or sandstone?) hills in the neighbourhood of Wanka, and no trace of rock, except at el-Haswa, above Hillah. At Hit the river is from 30 to 35 ft. in depth, with a breadth of 250 yds., and a current of 4 m. an hour, but from this point it diminishes in volume, receiving no new affluents but dissipating itself in canals and lagoons. At Felfula, in the latitude of Bagdad, the Euphrates and Tigris closely approach each other, and then, widening out, enclose the plain of Babylonia (Arab. Swawd). Through this part of its course the current of the river, except where restricted by floating bridges—at Felfula, Mussaib, Hillah, Diwanieh and Samawa—does not normally exceed a mile an hour, and both on the main stream and on its canals the jerd or oxbucket takes the place of the naoura or water-wheel for purposes of irrigation.

In early times irrigating canals distributed the waters over the plain, and made it one of the richest countries of the East, so that historians report three crops of wheat to have been raised in Babylonia annually. As main arteries for this circulation of water through its system great canals, constituting in reality so many branches of the river, connected all parts of Babylonia, and formed a natural means both of defence and also of transportation from one part of the country to another. The first of these canals, taken off on the right bank of the river a little below Hit, followed the extreme skirt of the alluvium the whole way to the Persian Gulf near Basra, and thus formed an outer barrier, strengthened at intervals with watch-towers and fortified posts, to protect the cultivated land of the Swawd against the incursions of the desert Arabs. This gigantic work, the line of which may still be traced through its course, was formerly
called the Khandak Sabur or "Sapor's trench," being ascribed to the Sassanian king, Shapur I. Dholahtar, but is now known as the Cherra-Saburd, and is in the popular tradition said to have been excavated by a man from Basra at the behest of a woman of Hit whom he desired to make his wife. How early this work was begun is not clear, but it would appear to have been at least largely reconstructed in the time of the great Nebuchadrezzar.

The next important canal, the Dujial (Daul), left the Euphrates on the left, about a league above Ramadiya (Ar-Rabb), and flowed into the Tigris between Alexander and Basra. The Tigris joined the Euphrates at Baghdad. This canal still carries water and was navigable for steamboats until about 1875. Sassar, the modern Abu-Ghurayb, leaves the Euphrates three leagues lower down and enters the Tigris between Baghdad and Ctesiphon. The Nahr Mall of the ancient road, modern Rakhawia, leaves the Euphrates five leagues below this and joins the Tigris three leagues below Ctesiphon; while the Kutha, modern Habi-Ibrahim, leaving the Euphrates three leagues below the Mall joins the Tigris three leagues below Ctesiphon. In the times of the Arab conquests the chief canals of the country were the Nahr 'Isa, Nahr Sarsar, Nahr Mall (or Nahal Malcha), and Nahr Kutha, reticulating the entire country between the rivers, converted it into a continuous and luxuriant garden.

Just below Mussab there has been for all ages a great bifurcation of the river. The right arm was the original bed, and the left arm, on which Babylon was built, the artificial deviation, as is clear from the concave inscriptions. In the time of Alexander the nomenclature was reversed, the right arm being known as Pallacopa. Under the Arabs the old designation prevailed and the Euphrates is always described by the Arabian geographers as the river which flows direct to Kula, while the present stream, passing along the ruins of Babylon to Hillah and Diwanihe, has been universally known as the Nahr Sura. Occidental geographers, however, have followed the Greek use, and so to-day we call the river of Babylon or Nahr Sura the Euphrates and the older westerly channel the Hindieh canal.

At the present time the preservation of the embankments about the point of bifurcation demands the constant care of the Baghdad government. The object is to allow sufficient water to drain off to the westward for the due irrigation of the land, while the Hillah bed still retains the main volume of the stream, and is navigable to the sea. But it frequently happens that the dam at the head of the Hindieh is carried away, and, a free channel being thus opened for the waters of the river to the westward, the Hillah bed shoals to 2 or 3 ft., or even dries up altogether, while the country to the west of the river is turned into lakes and swamps. Below the bifurcation the river of Babylon was again divided into several streams, and indeed the most famous of all the ancient canals was the Arakhat (Archos of the Greeks and Serrat and Nile of the Arabs), which left that river just above Babylon and ran due east to the Tigris, irrigating all the central part of the Jezireh, and sending down a branch through Nasrieh and Etech to rejoin the Euphrates a little above the modern Nasrieh. The Narss, also, the modern Dagharra, which is still navigable to Nasirpur and beyond, left the Sura a little below Hillah; and at the present day another large canal, the Kehr, branches off near Diwanihe. It is easy to distinguish the great primitive watercourses from the lateral ducts which they fed, the latter being almost without banks and merely traceable by the winding curves of the layers of alluvium in the bed, while the former are hedged in by high banks of mud, heaped up during centuries of dredging.

Not a hundredth part of the old irrigation system is now in working order. A few of the mouths of the smaller canals are kept open so as to receive a limited supply of water at the rise of the river in May, which then distributes itself over the lower lying lands in the interior, almost without labour on the part of the cultivators, giving birth in such localities to the most abundant crops, but by far the larger portion of the region between the rivers is at present an arid howling wilderness dotted with tels or ruin-heaps, strewn in the most part with broken pottery, the evidence of former habitation, and bearing nothing but the camel-thorn, the wild caper, the colocynth-apple, and the many weeds of the desert. Swamps are full of huge reeds, bordered with tamarisk jungles, and in the lower reaches, where the water stretches out into great marshes, the river is clogged with a growth of agrostis. To obtain a correct idea of this region it must be borne in mind also that the course of the river and the features of the country on both banks are subject to constant fluctuation. The Hindieh canal and the main stream, the ancient Sura, rejoin another at Samawa. Down to this point, the bed of the Euphrates being higher than that of the Tigris, the canals run from the former to the latter, but below this the situation is reversed. At Nasirheh the Shattel-Hat, at one time the bed of the Tigris, and still navigable during the greater part of the year, joins the Euphrates. From this point downward, and to some extent above this as far as Samawa, the river forms a succession of reedy lagoons of the most hopeless character, the Paludes Chaldaii of antiquity, el Bathar of the Arabs. Along this part of its course the river is apt to be choked with reeds and, except where bordered by lines of palm trees, the channel loses itself in lakes and swamps. The inhabitants of this region seemed to have made, and probably beyond the control of the Turkish authorities, and navigation of the river between Korna and Suk-esheikh is unsafe owing to the attacks of armed pirates. From Garma Ali, where the Tigris and Euphrates meet, thence to the city of Bagdad, the river runs on to Basra, 1000 yds. in width and from 3 to 10 fathoms deep, navigable for steamers of good size.

The Euphrates from Korna to Basra the banks of the river are well cultivated and the date groves almost continuous; indeed this is the greatest date-producing region of the world. Twenty-five miles below Basra the river Karun from Shushet and Dizful flows off an arm, which seems to be artificial, into the Euphrates. This arm is named the Haffar, and at the confluence is situated the Persian town of Muhramah, a place most conveniently located for trade. In this vicinity was situated, at the time of the Christian era, the Parthian city of Spasini-Charax, which was succeeded by Chahmah Bahmad (Bamshid) under the Sassanians, and by Moharir under the Arabs. The bank of the river from this point belongs to Persia. It consists of an island named Abbadan, about 45 m. long, formed by alluvial deposits during the last fifteen centuries. (For the character of this alluvium and its rate of deposit see IRAK.)

Even more than the upper and middle Euphrates the lower Euphrates, from Hit downward, abound in ruins of ancient towns and cities, from the earliest prehistoric period onward to the close of the Caliphate (see IRAK). The fact also that many of the most ancient of these ruins, like Ur, Lagash (Sirpuria), Larsa, Erech, Nippur, Sippara and Babylon, were situated on the banks of the great canals would indicate that the control of the waters of the rivets by a system of canalization and irrigation was one of the first achievements of civilization. This ancient system of canalization was inherited from the Persians (who, in turn, inherited it from their predecessors), by the Arabs, who long maintained it in working order, and the astonishing fertility and consequent prosperity of the country watered by the Euphrates, its tributaries and its canals, is noticed already in the works of the ancients. The land itself, an alluvial deposit, is very fruitful. Wheat and the date palm seem to have been indigenous, and the latter is still one of the chief productions of the country, but in later years rice has taken the place of wheat as the staff of life. The decline of the country dates from the appearance of Turkish nomads in the 11th century; its ruin was completed by the Shammar Arabs in the 17th century; but, if the ancient system of irrigation were restored, sufficient grain could be grown to alter the conditions of the wheat supply of the world. At the present time, instead of the innumerable

3 The confidence for about 500 years was at Korna, over 30 m. higher up. Sir W. Willecock discovered (1909) that from Suk-esheikh the Euphrates had formed a new channel through the marshes. (See Geog. Journal, Jan. 1910.)
EUPHRONIUS—

(HERBERT BAEDERER, 12)

is craft on being difficulty, and navigation of expedition route. Not on Boats the settlements all preserves grove, 898 no the Hillah the course of the Arab government. In 871, however, fell through either on the financial question, or on the unwillingness of the Turkish government to sanction any line not connected directly with Constantinople. With the acquisition of the Suez Canal, moreover, the value of this route from the British standpoint was so greatly diminished that the scheme, so far as England was concerned, was quite abandoned. (For further notice of the railway question see Bagdad.)

Navigation.—The length of the Euphrates from its source at Diadum to the sea is about 1800 m., and its fall during the last 1200 m. about 10 ins. per mile. The river begins to rise in the end of March and attains its greatest height between the 21st and the 28th of May. It is lowest in November, and rocks, shallows, and the remains of old dams then render it almost un navigable. In antiquity, however, it was evidently in use for the transportation of merchandise and even of arms. Boats built in Syrian ports were placed on the Euphrates by Seleucus and Alexander, andattacked Euphrates (1853) that in this day the river was a frequented route followed by merchants on their way from the Mediterranean to Babylon. As the most direct line of transit between the Mediterranean and the Persian Gulf, offering an alternative means of communication with India not greatly inferior to the Egyptian route, the Euphrates route early attracted the attention of the British government. During the Napolonic wars, indeed, and up to the time when the introduction of steam navigation rendered the Red Sea accessible at all seasons of the year, the political correspondence of the home and Indian governments usually passed by the Euphrates route. Various plans were suggested for the development of this route as a means of goods as well as postal conveyance, and in 1853 Colonel F. R. Chesney was sent out at the head of an expedition with instructions to transport two steamers from the Mediterranean to the Euphrates, and, after putting them together at Birejik, to attempt the descent of the river to the sea. One of these steamers was lost in a squall during the passage down the river near el-Irbi, but the other performed the voyage in safety and thus demonstrated the practicability of the downward navigation. Following on this first experiment, the East India Company, in 1851, proposed to maintain a permanent flotilla on the Tigris and Euphrates, and set two vessels, the "Noreia" and the "Nimrod," under the command of Captain Campbell of the Indian navy, to attempt the ascent of the latter river. The experiment was so far successful that, with incredible difficulty, the two vessels did actually reach Meskene, but the result of the expedition was to show that practically the river could not be used as a high-road of commerce, the continuous rapids and falls during the low season, caused mainly by the artificial obstructions of the irrigating dams, being insurmountable by ordinary steam power, and the aid of hundreds of hands being thus required to drag the vessels up the stream at those points by main force. Under Midhat Pasha, governor-general of Bagdad from 1866 to 1871, an attempt was made by the Turkish authorities to establish regular steam navigation on the Euphrates. Midhat caused many of the dams to be destroyed and for some years occasional steamers were run between Meskene and Hillah in flood time, from April to August. But with the transfer of Midhat this feeble attempt at navigation was abandoned. At the present time the river is navigated by sailing craft of some size from Hit downstream. Above that point there is no navigation except by the native rafts (kelbec), which descend the river and are broken up on arrival at their point of destination. There is, however, little travel of this sort on the Euphrates in comparison with the amount on the Tigris.

When it became evident that, under present conditions at least, the navigation of the middle Euphrates was impracticable, attention was turned, owing to the particularly advantageous geographical position of its valley, to schemes for connecting the Mediterranean and Persian Gulf by railway as an alternative means of communication with India, and various surveys were made for this purpose and various routes laid out. All these published, however, fell through either on the financial question, or on the unwillingness of the Turkish government to sanction any line not connected directly with Constantinople. With the acquisition of the Suez Canal, moreover, the value of this route from the British standpoint was so greatly diminished that the scheme, so far as England was concerned, was quite abandoned. (For further notice of the railway question see Bagdad.)

EUPHROSINE, the name of two Byzantine empresses.

1. Euphrosine, a daughter of Constantine VI. Although she had taken a monastic vow she became the second wife of Michael II. (q.v.), a marriage which was practically forced upon her by Michael, who was anxious to strengthen his claims to the throne by an alliance with the last representative of the Isaurian dynasty and secure the compliance of senate and patriarch with his desire. No issue was born of this union, and after the death of her husband and accession of her stepson Theophilus Euphrosine again retired into a convent.

2. Euphrosine, the wife of Alexius III. (q.v.). After securing the election of her husband to the throne by wholesale bribery she virtually took the government into her hands and restored the waning influence of the monarchy over the nobles. In spite of her talent for government she went far to hasten the empire's downfall by her unbounded extravagance, and made the dynasty unpopular by her open profligacy, which went unpunished but for one short term of banishment. She followed her husband into exile in 1203 and died seven years later in Epirus.

EUPHIUSM, the peculiar mode of speaking and writing brought into fashion in England towards the end of the reign of Elizabeth by the vague of the fashionable romance of Euphues, published in 1578 by John Lyly. As early as 1570 Ascham in his Schoolmaster had written of Euphues (that is, a man well-endowed by nature, from the Gr., e.h., = good grace) as "that is apt by goodness of wit, and applicable by readiness of words, to learning, having all other qualities of the mind and parts of the body that must another day serve learning." Lyly adopted this word as the name of the hero of his romance, and it is with him that the vogue of Euphues began. John Lyly, "always averse to the cranky studies of logic and philosophy, and his genius being naturally bent to the pleasant paths of poetry," devoted himself exclusively to the service of the ladies, a thing absolutely unprecedented in English literature. He addressed himself to "the gentlewomen of England," and he had the audacity, in that grave age, to say that he would rather see his books "lie shut in a lady's casket than open in a scholar's study." In order to attain this object, he set himself to create a
superfine style in writing, and to illustrate this in his compositions. He undertook to produce a pleasurable literature for the boudoir and the bower. Lyly was twenty-six when he published in 1579 the first part of *Euphues: the Anatomy of Wit*. A second part, entitled *Euphues and his England*, appeared in 1580. His object was diametrically opposed to that of writers who had striven to instruct, reprove or edify their contemporaries. Lyly, assuming that women only will read his book, says:—“After dinner, you may overlook it to keep you from sleep, or if you be heavy to bring you asleep, for to work upon a full stomach is against physic, and therefore better were it to hold *Euphues* in your hands, though you let him fall when you be willing to wink, than to sew in a closet and prick your fingers when you begin to read.”

For a comprehension of the nature of Euphues it is necessary to remember that the object of its invention was to attract and to disarm the ladies by means of an ingenious and playful style, of high artificiality, which should give them the idea that they were being entertained by an enthusiastic admirer, not instructed by a solemn pedagogue. For fifty years the romance of *Euphues* retained its astonishing popularity. As late as 1632 the publisher Edward Blount (1560?—1632), recalling the earliest enthusiasm of the public, wrote of John Lyly, “Oblivion shall not so transpose a son of the Muses, and stamp a song on them falling.”

Our next step is to indicate a new English which he taught them. *Euphues and his England* began first that language. All our ladies were then his scholars, and that beauty in Court, which could not parley Euphues, was as little regarded, as she which, now there, speaks not French.” Among those who applied themselves to this “new English,” one of the most ardent was Queen Elizabeth herself, who has been styled by J. R. Green “the most affected and destastable of euhuphsists.” At the height of the popularity of this strange dialect, it was said by William Webbe, in his *Discourse of English Poetry* (1586), to consist in a combination of “singular eloquence and brave composition of apt words and sentences, in fit phrasers, in pithy sentences, in gallant tropes, in flowing speech,” while a French poet of the same age calls Lyly a “rarefier” of the English speech; another panegyrist describes him as “alter Tutlius,” meaning that, in inventing Euphues, he had introduced into English the refinements of a Ciceronian style.

When we put aside these excessive compliments, and no less the attacks from which the style suffered as soon as it began to go out of fashion, we are enabled to observe merits as well as faults in the merely curious experiment. Euphues did not attempt to render the simplicity of nature. On the contrary, in order to secure refinement, it sought to be as affected, as artificial, as high-pitched as possible. Its most prominent feature was an incessant alternating of phrases in chains of antitheses, thus:—“Though the tears of the hart be salt, yet the tears of the boar be sweet, and though the tears of some women be counterfeit to deceive, yet the tears of many be current to try their love”; or this:—“Reject it not because it procedeth from one which hath been lewd, no more than ye would neglect the gold because it lieth in the dirty earth, or the pure wine for that it cometh out of a homely presse, or the precious stone aetides which is found in the filthy nests of the eagle, or the precious gem draconites, that is ever taken out of the poisoned dragon.”

This second excerpt, moreover, suggests another of the main characteristics of Euphues, the incessant use, for purposes of ornament, of similes taken from fabulous records of zoology, or relating to mythical birds, fishes or minerals. This was an attribute of the “new English” which was excessively admired, and copied with a shameless extravagance. Instances of it are found on every page of Lyly’s books, thus:—“Although the worm entereth almost into every wood, yet he eateth not the cedar-tree; though the stone cylintrus at every thunder-clap roll from the hill, yet the pure sleek stone mounteth at the noise; though the rust fret the hardest steel, yet doth not eat into the emerald; though polyus change his hue, yet the salamander keepeth his colour”; and so on, *ad infinitum*. That lady was considered most proficient in euhuphs who could keep up longest these chains of similies taken out of fabulous natural history. Alliteration was also a particular ornament of the euhuphsitic style, as:—“The bavin, though it burn bright, is but a blaze,” but the use of this artifice by Lyly himself was rarely exaggerated; for instances of its excess we have rather to turn to his imitators. In the following passage the typical forms of Euphues, in its pure and original conditions, are so combined and illustrated as to require no further commentary:—“Do we not commonly see that in painted pots is hidden the deadliest poison? that in the greenest grass is the greatest serpent? in the clearest water the ugliest toad? Doth not experience teach us that in the most curious sepulchre are enclosed rotten bones? that the cypress tree beareth a fair leaf, but no fruit? that the ostrich carrieth fair feathers, but rank flesh?”—and so forth.

It will be noticed that these characteristics differ in many respects from the specimen of euhuphs which are most familiar to a modern reader, namely the extravagant speech placed in the mouth of Sir Pierce Shafton in Sir Walter Scott’s romance of *The Monastery*. Scott modelled this character on what he called “forgotten and obsolete model of folly, once fashionable,” Lyly’s novel of *Euphues*, but he had not studied the original to sufficient purpose, and the bombastic ravings of Sir Pierce, which simply teems with words which we should call grotesque, do not reach to the real characteristics of Euphues. Scott betrays his own error when he says that “the extravagance of Euphues... predominates in the romances of Calprenède and Scuderi,” in which it is true that a tone of postrepteous garrulity finds a language of its own, but that is not the language of Euphues. What Sir Pierce Shafton talks is a mixture of the style of these French romances, with the ostentation of Sir Folping Flutter and the extravagances of the Scotch translator of Rabelais. But these various sorts of pretentious eloquence have little or nothing in common with the balanced and concealed style of Euphues.

We find that the genuine sort of this kind of superfine conversation was originally called “Euphues,” simply, as Overbury speaks of a man who “speaks Euphues, not so gracefully as heartily.” The earliest instance of the word “Euphues” which has been traced occurs in a letter, written by Gabriel Harvey in 1592, when he speaks of a man, who would be smart, as talking “a little Euphues.” Dekker, in the *Gull’s Hornbook* of 1609, uses the word as an adjective, and denounces “Euphues gentleman.” When the practice was going out of fashion we find it thus severely stigmatized by Michael Drayton, a poet who had little sympathy with the artificial refinement of Lyly. In an elegy, printed in 1627, Drayton refers to the merit of Sir Philip Sidney, who recalled English prose to sanity, and did first reduce

Our tongue from Lyly’s writings then in use, Talking of stones, stars, plants, of fishes, flies, Playing with words and idle similes, As th’English apes and very zanies be Of everything that they do hear and see, So imitating his ridiculous tricks They spake and writ, all like mere lunatics.

This severe censure of Euphues may serve to remind us that hasty critics have committed an error in supposing the *Arcadia* of Sidney to be composed in the fashionable jargon. That was certainly the intention of the author, and in fact the publication of the *Arcadia*, eleven years after that of *Euphues*, marks the beginning of the downfall of the popularity of the latter. Sidney’s prose, it is true, was extremely ornamented, but it was instinct with romantic fancy, and it affected a chivalrous and florid fulness which was artificial enough, but wholly distinct from the more homely elegance of Euphues as we have defined it. The publication of the *Arcadia* was a severe blow to the Euphuists. Immediately the ladies began to desert their former favourite, and the object at court became, as Ben Jonson noted, “to observe as pure a phrase and use as choice figures in ordinary conference as any be in the *Arcadia*.” But, in the meantime, Lyly had found in Greene, Lodge, Dickinson, Nicholas Breton and others enthusiastic disciples who had learned all the formulas of Euphues, and could bring them forth as
fluently and elegantly as he could himself. Nevertheless the trick wore out, with the taste that it had created, and by the close of the reign of James I. Euphism had become a dead language.

Critics have not failed to insist, on the other hand, that a species of Euphism existed before Euphues was thought of. It has been supposed that a translation of the familiar epistles, or, as they were called, the "Golden Letters," of a Spanish monk, Antonio de Guevara, led Lyly to conceive the extraordinary style which bears the name of his hero. Between 1574 and 1578 Edward Hallowes (fl. 1550-1600) translated into a very extravagant English prose three of the works of Guevara. Earlier than this, in 1557, Sir Thomas North had published a version of the same Spanish writer's Reloj de Príncipes (The Dial of Princes), a moral and philosophical romance which is not without a certain likeness in plan and language to Euphues. It is extremely difficult to know to what extent these translations, which were not strikingly unlike highly volatile specimens of the ornamental English prose of their period, can be said to be responsible for the production of Euphism. At all events no one can doubt that it was Lyly who concentrated the peculiarities of mannerism, and who gave to it the stamp of his own remarkable talent.

See Landmann, Der Euphismus (1881); Arber's edition of Euphues (1865); R. W. Bond's Complete Works of Lyly (1902); Hallam, Jusserand, S. Lee, passim. (E. G.)

**Eupolion** (Gr. ευπόλιον, well, πολιός, fat), a hydrocarbon of the paraffin series, probably a pentane, 

C\(_5\)H\(_{12}\), discovered by K. Reichenbach in wood-tar. It is also formed in the destructive distillation of many substances, as wood, coal, cautic-burnt bones, and the fixed oils. It is a colourless, volatile, inflammable liquid, having a specific gravity at 20°C of 0.65.

**Eupolpus** (c. 446-441 B.C.), Athenian poet of the Old Comedy, flourished in the time of the Peloponnesian War. Nothing whatever is known of his personal history. With regard to his death, he is said to have been thrown into the sea by Alcibiades, whom he had attacked in one of his plays, but it is more likely that he died fighting for his country. He is ranked by Horace (Sat. i. 4, 1), along with Cratinus and Aristophanes, as the greatest writer of his school. With a lively and fertile fancy Eupolus combined a sound practical judgment; he was reputed to equal Aristophanes in the elegance and purity of his dictation, and Cratinus in his command of irony and sarcasm. Although he was at first on good terms with Aristophanes, their relations subsequently became strained, and they accused each other, in most virulent terms of imitation and plagiarisms. The 17 plays attributed to Eupolus, with which he obtained the first prize seven times, only fragments remain. Of these the best known were: the *Kokales*, in which he pilloried the spendthrift Callias, who wasted his substance on sophists and parasites; the *Maricas*, an attack on Hyperbelos, the successor of Cleon, under a fictitious name; the *Baphae*, against Alcibiades and his clubs, at which profligate foreign rites were practised. Other objects of his attack were Socrates and Cimon. The *Demioc* and *Poleis* were political, dealing with the desperate condition of the state and with the allied (or tributary) cities.

Fragments in T. Kock, *Comico rum Atticorum fragmenta*, i. (1880).

**Eupompos**, the founder of the great school of painting which flourished in the 4th century at Sicyon in Greece. He was eclipsed by his successors, and is chiefly remembered for the advice which he is said to have given to Lyssipus to follow nature rather than any master.

**Eurasian**, a term originally confined to India, where for upwards of half a century it was used to denote children born of Hindu sires and European mothers (especially Portuguese fathers). Following the geographical employment of the word Eurasia to describe the whole of the great land mass which is divided into the continents of Europe and Asia, Eurasian has come to be descriptive of any half-castes born of parents representing the races of the two continents. It has further an ethnological sense, A. H. Keane (*Ethnology*, 1866) proposing to find in the Eurasian Steppe the true home of the primitive Aryan groups.

Joseph Deniker (*Anthropology*, 1900) makes an Eurasian group to include such peoples (Ugrians, Turko-Tatars, &c.) as are represented in both continents. Giuseppe Sergi, in his *Mediterranean Race* (London, 1901), uses Eurasian to denote that variety of man which "brought it with it into Europe (from Asia in the later Neolithic period) flexional languages of Aryan or Indo-European type."

**Eure**, a department of north-western France, formed in 1790 from a portion of the old province of Normandy, together with the countship of Évreux and part of Perche. Pop. (1906) 330,140. Area, 2,350 sq. m. It is bounded N. by the department of Seine Inférieure, W. by Calvados, S.W. by Orne, S. by Eure-et-Loir, and E. by Seine-et-Oise and Oise. The territory of Eure, which now extends 800 ft. in altitude, is broken up by its rivers into well-wooded plateaus with a general inclination from south to north. Forests cover about one-fifth of the department. The Seine flows from S.E. to N.W. through the E. of the department, and after touching the frontier at two or three points forms near its mouth part of the northern boundary. All the rivers of the department flow into the Seine,—on the right bank the Andelle and the Epte, and on the left the Eure with its tributaries the Avre and the Iton, and the Risle with its tributary the Charentonne. The Eure, from which the depart- ment takes its name, rises in Orne, and flowing through Eure-et-Loir, falls into the Seine above Pont de l'Arche, after a course of 44 m. in the department. The Risle likewise rises in Orne, and flows generally northward to its mouth in the estuary of the Seine. The climate is mild, but moist and variable. The soil is for the most part clayey, resting on a bed of chalk, and is, in general, fertile and well tilled. The chief cereal cultivated is wheat; oats, colza, flax and beetroots are also grown. There is a wide extent of pastureage, on which are reared a considerable number of cattle and sheep, and especially those horses of pure Norman breed for which the department has long been celebrated. Fruit is very abundant, especially apples and pears, from which much cider and perry are made. The mineral products of Eure include freestone, marl, lime and brick-clay. The chief industries are the spinning of cotton and wool, and the weaving, dyeing and printing of fabrics of different kinds. Brewing, flour-milling, distilling, tanner, cotton-bleaching, cider-making, metal-founding, tanning, and the manufacture of glass, paper, iron ware, nails, pins, wind-instruments, bricks and sugar are also carried on. Coal and raw materials for its industries are the chief imports of Eure; its exports include cattle, poultry, eggs, butter, grain and manufactured goods. The department is served chiefly by the Western railway; the Seine, Eure and Risle provide 87 m. of navigable waterway. Eure is divided into the following arrondissements (containing 36 cantons, 700 communes)—Évreux, Louviers, Les Andelys, Bernay, and Pont- Audemer. Its capital is Évreux, which is the seat of a bishopric of the ecclesiastical province of Rouen. The department belongs to the III. Army Corps and to the académie (educational division) of Caen. Its court of appeal is at Rouen.

Évreux, Les Andelys, Bernay, Louviers, Pont-Audemer, Verneuil, Vernon and Gisors are the principal towns of the department. At Gaillon there are remains of a celebrated château of the archbishops of Rouen (see Louviers). Pont de l'Arche has a fine Gothic church, with stained-glass windows of the 16th and 17th centuries; the church of Tillières-sur-Arve is a graceful specimen of the Renaissance style. The churches of Conches (15th or 16th century) and of Rugies (13th, 15th and 16th centuries), and the château of Beaumesnil (16th century) are also of architectural interest.

**Eure-et-Loir**, a department of north-western France, formed in 1790 from portions of Orléans and Normandy. Pop. (1906) 273,823. Area, 2,293 sq. m. It is bounded N. by the department of Eure, W. by Orne and Sarthe, S. by Loir-et-Cher, S.E. by Loiret, and E. by Seine-et-Oise. The Perche in the south-west and the Thimerais in the north-west are districts of hills and valleys, woods, lakes and streams. The region of the east and south is a level and uniform expanse, consisting for the most part of the riverless but fertile plain of Beaute, sometimes called
the “granary of France.” The northern part of Eure-et-Loir is watered by the Eure, with its tributaries the Vêvre, Blaise and Avre, a small western portion by the Huisme, and the south by the Loir with its tributaries the Conie and the Ozanne. The air is pure, the climate mild, dry and not subject to sudden changes. The soil consists, for the most part, either of clay intermixed with sand or of calcareous earth, and is on the whole fruitful. Agriculture is better conducted than in most of the departments of France, and the average yield per acre is greater. Cereals occupy half the surface, wheat and oats being chiefly cultivated. Among the other agricultural products are barley, hemp, flax and various vegetables, including good asparagus. Wine is not extensively produced, nor is it of the best quality; but in some parts, especially in the Perche, there is an abundant supply of apples, from which cider is made as the common drink of the inhabitants. The extensive meadows supply pasture for a large number of cattle and sheep, and the horses raised in the Perche have a wide reputation as draught animals. Bee-farming is commonly prosecuted. The department produces lime, grindstones and brick-clay. The manufactures are not extensive; but there are flour and saw-mills, tanneries and leather-works, copper and iron foundries, starch-works, dye-works, distilleries, breweries and potteries; and agricultural implements, cotton and woollen goods, and yarn, hosiery, boots and shoes, sugar, felt hats and paper are made. Eure-et-Loir exports the products of its soil and live stock; its imports include coal, coke and wearing apparel. It is served by the railways of the Western and the Orléans Companies and by those of the state, but it has no navigable waterways. The department has Chartres for its capital, and is divided into the arrondissements of Chartres, Châteaudun, Dreux and Nogent-le-Rotrou (24 cantons and 426 communes). It forms the diocese of Chartres (province of Paris), and belongs to the académie (educational division) of Paris and the region of the IV. Army Corps. Its court of appeal is at Chartres.

Chartres, Dreux, Châteaudun, Nogent-le-Rotrou and Anet are the more noteworthy places in the department (q.v.). At Bonneval the lunatic asylum occupies the 18th-century buildings of a former Benedictine abbey. The abbey church belonged to the 13th century, but only a gateway flanked by two massive towers is left. The château of Maintenon dating from the 16th and 17th centuries was presented by Louis XIV. to Madame de Maintenon, by whom additions were made; the aqueduct (17th century) in the park was designed to carry the water of the Eure to Versailles, but was not completed. There is a fine château of the late 15th century, restored in modern times, at Montigny-le-Gannelon, and another of the 15th, 16th and 17th centuries, at St Léger, the property of Sully, at Villebon. St Lœubin-des-Joncherets has a handsome church of the 11th century, in which there are stained-glass windows dating from the 16th century.

EUREKA, a city, port of entry, and the county seat of Humboldt county, California, U.S.A., on the E. shore of Humboldt Bay. Pop. (1880) 2639; (1890) 4858; (1900) 7327; 2035 foreign-born; (1910) 11,843. It has a good harbour, greatly improved by the National government, and is connected with San Francisco, Portland and other west coast ports by steamship lines. In 1909 a railway (the Northwestern Pacific), to connect Eureka with San Francisco, was under construction. The district owes its reputation as a health resort to its equable climate and to the protection afforded by the wide coastal timber belt. Eureka is the principal port for the shipment of redwood lumber, and saw-milling is carried on here on an enormous scale. Several short railways run from Eureka and Arcata (pop. in 1900, 952) across the bay, into the forest, and bring lumber to the mills, most of which are in or near Eureka. Humboldt county was organized in 1853. Eureka was then already the centre of an important lumber trade, principally in spars. It was incorporated in 1856, displacing Union (now Arcata) as the county seat in the same year.

EUREKA SPRINGS, a city and health resort, one of the county seats—Berriville being the other—of Carroll county, in the extreme north-western part of Arkansas, U.S.A., in the Ozark uplift, 1800 ft. above the sea-level. Pop. (1890) 3766; (1900) 5572 (142 of negro descent); (1910) 5238. There is a transient population of thousands of visitors during the year. The city is built picturesquely on the sides of a gulch, down which runs the Missouri & North Arkansas railway. A creek running through the city empties into the White river, only a few miles distant. The surrounding country varies in character from mountains to rolling prairie. The encircling hills are laden with a covering of pine. The normal mean temperature for the year is about 59°F. (42°F. in winter, 61°F. in spring, 75°F. in summer, and 58°F. in autumn); the average rainfall, about 33 in. The atmosphere is dry and clear. Apart from its share in the agricultural interests of the surrounding region, devoted mainly to Indian corn, small grains and fruits,—the entire economy of Eureka Springs consists in the medicinal springs, more than forty of which, lying within the corporate limits, are held in trust by the city for the free use of the public. The temperature of the springs varies from about 57°F. to 64°F. Each gallon of their waters contains about 28-5 cub. in. of gaseous matter and from 6 to 9 grains of solids held in solution. The city waterworks are owned by the municipality. The springs have been exploited since 1879, when the first settlement was made. The city was chartered in 1880.
EURIPIDÉS

About 400 B.C. Euripides left Athens, and after a residence in the Thessalian Magnesia repaired, on the invitation of King Archelaus, to the Macedonian court, where Greeks of distinction were always welcome. In his Archelai Euripides celebrated that legendary son of Temenus, and head of the Temenid dynasty, who had founded Aegae; and in one of the meagre fragments he evidently alludes to the beneficent energy of his royal host in opening up the wild land of the North. It was at Pella, too, that Euripides composed or completed, and perhaps produced, the Bacchae. Jealous courtiers, we are told, contrived to have him attacked and killed by savage dogs. It is odd that the fate of Actaeon should be ascribed, by legend, to two distinguished Greek writers, Euripides and Lucian; though in the former case at least the fate has not such appropriateness as the Byzantine biographer discovers in the latter, on the ground that its victim “had waxed rabid against the truth.” The death of Euripides, whatever its manner, occurred in 406 B.C., when he was seventy-four. Sophocles followed him in a few months, but not before he had been able to honour the memory of his younger rival by causing his actors to appear with less than the full costume of the Dionysiac festival. Soon afterwards, in the Fros, Aristophanes pronounced the epitaph of Attic comedy on Attic tragedy.

The historical interest of such a life as that of Euripides consists in the very fact that his external record on the state—that, unlike Aeschylus or Sophocles, he had no place in the public action of his time, but dwelt apart as a student and a thinker. He has made his Medea speak of those who, through following quiet paths, have incurred the reproach of apathy (βαθυλατρί). Undoubtedly enough of the old feeling for civic life remained to create a prejudice against one who held aloof from the affairs of the city. Quietness (απραγμοσία), in this sense, was still regarded as akin to indolence (αργία). Yet here we see how truly Euripides was the precursor of that near future which, at Athens, saw the more complete divergence of society from the state.

In an age which is not yet ripe for reflection or for the subtle analysis of character, people are content to express in general types those primary facts of human nature which strike every one. Achilles will stand well enough for the young chivalrous warrior, Odysseus for the man of resource and endurance. In the case of the Greeks, these types had not merely an artistic and a moral interest; they had, further, a religious interest, because they were the gods of Greece. For the Greeks, though the gods, were their own ancestors. Greek tragedy arose when the choral worship of Dionysus, the god of physical rapture, had engraven upon it a dialogue between actors who represented some persons of the legends consecrated by this faith. The dramatist was accordingly obliged to refrain from multiplying those minute touches which, by individualizing the characters too highly, would detract from their general value as types in which all Hellenic humanity could recognize its own image glorified and raised a step nearer to the immortal gods. This necessity was further enforced by the existence of the chorus, the original element of the drama, and the very essence of its nature as an act of Dionysiac worship. Those utterances of the chorus, which to the modern sense are so often platitudes, were not so to the Greeks, just because the moral issues of tragedy were felt to have the same typical generality as these comments themselves.

An unerring instinct keeps both Aeschylus and Sophocles within the limits imposed by this law. Euripides was only fifteen in the homogeneous Sophoclean. But when Euripides began to write, it had not been enough to any man of his time and culture that, though an established prestige might be maintained, a new poet who sought to construct tragedy on the old basis would be building on sand. For, first, the popular religion itself—the very foundation of tragedy—had been undermined. Secondly, scepticism had begun to be busy with the legends which that religion consecrated. Neither gods nor heroes commanded all the old unquestioning faith. Lastly, an increasing number of the audience in the theatre began to be destitute of the training, musical and poetical, which had prepared an earlier generation to enjoy the chaste and placid grandeur of ideal tragedy.

Euripides made a splendid effort to maintain the place of tragedy in the spiritual life of Athens by modifying its interests in the sense which his own generation required. Could not the heroic persons still excite interest if they were made more real,—if, in them, the passions and sorrows of every-day life were portrayed with greater vividness and directness? And might not the less cultivated part of the audience at least enjoy a thrilling plot, especially if taken from the home-legends of Attica? Euripides became the virtual founder of the romantic drama. In so far as his work fails, the failure is one which probably no artistic task could then have wholly avoided. The frame within which he had to work was one which could not be stretched to his plan. The chorus, the masks, the narrow stage, the conventional costumes, the slender opportunities for change of scenery, were so many fixed obstacles to the free development of tragedy in the new direction. But no man of his time could have broken free from these traditions; in attempting to do so he must have wrecked either his fame or his art. It is not the fault of Euripides if in so much of his work we feel the want of harmony between matter and form. Art abhors compromise; and it was the misfortune of Attic tragedy that it needed nothing but a compromise could save it. Two devices have become classical in our romances: the crusade against him—the prologue and the deus ex machina. Doubtless the prologue is a slipshod and sometimes ludicrous expedient. But the audiences of his days were far from being so well versed as their fathers in the mythic lore, and, on the other hand, a dramatist who wished to avoid trite themes had now to go into the byways of mythology. A prologue was often perhaps desirable or necessary for the instruction of the audience. As regards the deus ex machina, a distinction should be observed between those cases in which the solution is really mechanical, as in the Andromache and perhaps the Orestes, and those in which it is warranted or required by the plot, as in the Hippolytus and the Bacchae. The choral songs in Euripides, it may be granted, have often nothing to do with the action. But the chorus was the greatest of difficulties for a poet who was seeking to present drama of romantic tendency in the plastic form consecrated by tradition. So far from censuring Euripides on this score, we should be disposed to regard his management of the chorus as a signal proof of his genius, originality and skill.

Euripides is said to have written 92 dramas, including 8 satyr-plays, the best claim of antiquity allowed 75 as genuine. Nauck has collected 1117 Euripidean fragments. Works.

numbers 1092-1117 are doubtful or spurious; numbers 832-1091 are from plays of uncertain title; numbers 1-841 represent fifty-five lost pieces, among which some of the best known are the Andromeda, Antiope, Bellerophon, Cretans, Erectheus, Oedipus, Phaethon, and Telephus.

1. The Alcestis, as the didascaliae tell us, was brought out in Ol. 85, i.e. at the Dionysia in the spring of 438 B.C., as the fourth play of a tetralogy comprising the Cretan Women, the Alcestes at Paphos, and the Telephus. The Alcestis is altogether removed from the character, essentially grotesque, of a mere satyr-drama. On the other hand, it has features which distinctly separate it from a Greek tragedy of the normal type. First, the subject belongs to none of the great cycles, but to a byway of mythology, and involves such strange elements as the servitude of Apollo in a mortal household, the decree of the fates that Admetus must die on a fixed day, and the redemption of the dead man from the land of the shadowless. Secondly, the treatment of the subject is romantic and even fantastic, so that in the passage where Apollo is directly confronted with the daemonic figure of Thanatos. Lastly, the boisterous, remorseful, and generous feeling, not the maenadic, but a distinctly satyr-like scene—which in the blank original, hardly bears the subtle interpretation which in Balausdion is hinted by the genius of Browning, that Herakles got drunk in order to keep up other people’s strength. When the happy ending is taken into account, it is not surprising that some should have called this trigamous comedy. But we cannot regard it. The slight and purely incidental strain of comedy is but a moment of relief between the tragic sorrow and

1 A considerable fragment of the Antiope was discovered in Egypt in the latter part of the 19th century: ed. J. P. Mahaffy in vol. viii. of the Cunningham Memoirs (Dublin, 1861); and quite recently fragments, probably from the Hypolytus, the Phaethon, and the Cretan (see Berliner Klassiker Texte, v. 2, 1907).
In Euripides The Medea, Medea kills her children by unintentionally murdering them while she is not aware of the action. This play features the theme of love and the consequences of actions taken.

In contrast to this, the play Medea by Euripides features Medea's love for Jason, which ultimately leads to her actions. The play is known for its exploration of themes such as love, betrayal, and the consequences of actions.

Theseus and Medea: In the play Theseus and Medea by Euripides, Medea returns to Athens with Jason, her husband. However, after Jason's death, Medea plots to assume power and establish a new empire in Argos. The play explores themes such as power, ambition, and the consequences of actions taken.

The play Medea by Euripides is considered one of the most influential plays in the classical tradition. It features the exploration of themes such as love, betrayal, and the consequences of actions taken. The play is known for its exploration of the complexities of human relationships and the consequences of actions taken.

The play Theseus and Medea by Euripides is considered one of the most influential plays in the classical tradition. It features the exploration of themes such as power, ambition, and the consequences of actions taken. The play is known for its exploration of the complexities of human relationships and the consequences of actions taken.
10. Iphigenia among the Tauri, which metre and diction mark as one of the later plays, is also one of the best—excellent both in the management of a romantic plot and in the delineation of character. The scene is laid at the temple of Artemis in the Tauric Chersonese (the Crimean)—on the site of the modern town of Eumopdés. Iphigenia, who had been doomed to die at Aulis for the Greeks, had been snatched from that death by Arctemis, and had become a priestess of the goddess in the Tauric shrine, where human victims were imprisoned. Two strangers, who had landed among the Tauri, having alighted at a certain shrine of the goddess, Arctemis, he has the advantage in his management of the catastrophe. But it is only just to Eupiopdes to remember that, while his competitor had free scope of treatment, he, a Greek dramatist, was bound to the motive of the Greek legend and was obliged to conclude with the foundation of the Attic worship.

11. The Trojan Women appeared in 415 B.C. along with the Alexander, the Palamedes, and a satyr-play, the Siphysus. It is a picture of the miseries endured by noble Trojan damaskene, Andromache, Cassandra, and other women of Troy, taking part in the Trojan War. It has a plot in the proper sense—only an accumulation of sorrows on the heads of the passive sufferers. The piece is less a drama than a pathetic spectacle, closing with the capture of the Trojan towers in flames. The suffering woman is the one hero in the play, and the tragedy is a sacrifice for its near approach to the character of melodrama. It must be observed that there is no ground for the inference—sometimes made an accusation against the poet—that the choral passage, v. 769, by which Electra boasts of her victory, was composed by her father at the same time (415 B.C.). The mention of the "land of Aetna over against Carthage" (v. 220) speaks of it as "renowned for the trophies of prowess"—a topic, surely, not of encouragement but of boast.

12. The Helen—produced, as we learn from the Aristophanic scholia, in 412 B.C., the year of the lost Andromache—is not one of its author's happier efforts. It is founded on a strange variation of the Trojan myth, first adopted by Sophocles in his Oedipus Tyrannus, and repeated only in part by Euripides in the Trojan Women. The whole scene was transferred to Troy, while the real Helen was detained in Egypt. In this play she is rescued from the Egyptian king, Theoclymenus, by the use of her husband Menelaus, who brings her safely back to Greece. The romantic element thus handled by the comic poet—nominally Aristophanes in the Thesmophoriazusai—felt this; nor can we blame them if they ridiculed a piece in which the mode of treatment was so transformed with the spirit of Greek tragedy as it was incapable all with that which constituted the highest meaning of Greek tragedy.

13. The Phoenissae was brought out, with the Oeneid and the Chrysippus, in 411 B.C., the year in which the recall of Alcibiades was demanded. It was acted in the public theatre at Samos, in the presence of Archelaus, king of Macedon. Hundred, ratified by the Assembly at Athens (Thuc., viii. 81. 97). The dialogue between Locmate and Phoenissai on the grief of banishment (τό ἄρειθαν μεταμφώσεας, v. 388 f.) has a certain emphasis which still apparently looks like an allusion to the pardon of the famous exile. The subject of the play is the same as that of the Aeschylean Seven against Thebes—the war of succession in which Argos supported Phoenissai against his brother Eetoes. The Phoenician maidens who form the chorus are imagined to have been on their way from Tyre to Delphi, where they were destined for service in the temple when they were detained at Thebes by the outbreak of the war—a device which affords a contrast to the Aeschylean chorus of Thelian elders, and which has also a certain fitness in view of the legends connecting Tyre and Delphi, to which the poet returns on his successes in the rivalry—which he has even pointed by direct allusions—with Aeschylus. The Phoenissae is full of brilliant passages, but it is rather a series of effective scenes than an impressive drama.

14. Plutarch (Lys. 15) says that, when Athens had surrendered to Lysander (404 B.C.) and when the fate of the city was doubtful, a Phocian officer happened to sing at a banquet of the leaders the first song of the chorus in the Phoenissae of Euripides.

15. vôλον, Π ελεία, σιτο εἰς καταρακτὸν ἀθλεῖ, and that "when they heard it, all were touched, so that it seemed a cruel deed to destroy for ever the city so famous once, the mother of such men." The character of the Electa, in metre and in diction, seems to be more frequent to the choral speeches when they were in referring to the Sicilian expedition the closing passage in which the Diosciu declare that they haste "to the Sicilian sea, to save ships upon the deep" (v. 1347), then the play could not be later than 415 B.C. Eupiopdes, it may more probably be placed something before the Orestes, which in some respects it much resembles: perhaps in or about the year 410 B.C. No play of Eupiopdes has been more severely criticized. The reason is evident. The Choephoroi of Aeschylus and the Electa of Sophocles appear to invoke a direct comparison to this drama. But, as R. C. Jebb suggested, such criticism as that of Schlegel should remember that works of art are not created in a vacuum, and that we must compare the view of the different poets, by which they which represent a common basis. It is simply unmeaning to contrast the elaborate homeliness of the Euripidean Electa with the severe grandeur of its rivals. Aeschylus and Sophocles, as different exponents of an artistic conception which is fundamentally humanitarian in its tendency, are not comparable. One should rather compare Euripides, as a representative of another conception, and must be tried by other principles. His Electa is, in truth, a daring experiment—daring, because the theme is one which the other school had made peculiarly its own.

16. The Iphigenia at Aulis, like the Bacchae, was brought out only after the death of Euripides. It is a very brilliant and beautiful piece of work, and the author, although his next play has suffered from interpolation more largely, perhaps, than any other of his works. As regards its subject, it forms a prelude to the Iphigenia in Tauris. Iphigenia has been doomed by her father Agamemnon to a sacrifice. It is observed, that Artemis claims such a sacrifice before the advance winds can fail. The genuine play, as we have it, breaks off at v. 1508, when Iphigenia has been led to the sacrificial altar. A spurious episode, of wretched workmanship (v. 1509-1626), relates, in the speech of a chorus, how Artemis saved Iphigenia. It has been a common belief that Euripides, in this piece, represented Tiresias in his compassion and with disinterestedness, and in all probability was originally designed for representation in Macedonia—a region with whose traditions oristic worship of Dionysus was so congenial. The play is sometimes quoted as a evidence that Euripides is the author of the Bacchae. It has been named a piece from the chorus, unless the chorus bore an important part in the action or the leading action was divided between some persons. Possibly, however, in this instance he may have chosen a title which would at once interest the Macedonians and be grandly suited to the public. Pentheus would suggest a Greek legend about which they might know or care little. The Bacchae would at once announce a theme connected with rites familiar to the northern land.

17. The Bacchae, unlike the preceding play, appears to have been finished by its author, although it is said not to have been acted, on the Athenian stage at least, till after his death. It was composed, or perhaps it is more correct to say revised, for a northern audience, and in all probability was originally designed for representation in Macedonia—a region with whose traditions oristic worship of Dionysus was so congenial. The play is sometimes quoted as evidence that Euripides is the author of the Bacchae. It has been named a piece from the chorus, unless the chorus bore an important part in the action or the leading action was divided between some persons. Possibly, however, in this instance he may have chosen a title which would at once interest the Macedonians and be grandly suited to the public. Pentheus would suggest a Greek legend about which they might know or care little.
The Bacchae was always an exceptionally popular play—partly because its opportunities as a spectacle fitted it for generous representation, and so recommended it for performance at courts and on great public occasions. Demetrius the Cynic ("says Lucian, Adv. Indictum, 9") gave an elaborate noted at Corinth reading a very beautiful poem—"the Bacchae of Euripides, I think it was; he was at the place where the messenger narrates the doom of Pentheus and the deed of Agave. Demetrius snatched the book from him and tore it up, saying, 'It is better for Pentheus to be torn up at once by his father, be saved from being burnt by both men.'

18. The Cyclops, of uncertain date, is the only extant example of a satyric drama. The plot is taken mainly from the story of Odysseus and Polyphemus in the 9th book of the Odyssey. In order to be really successful in force of this kind, a poet should have a fresh feeling for the nature of the art parodied. It is because Euripides was not in accord with the spirit of the heroic myths that he is not strong in mythic travesty. His own tragedies—such as the Helen, the Electra, the Amphitryon—have, and over several years, contributed to destroy the meaning of satyric drama. They had done gravely very much what satyric drama aimed at doing grotesquely. They had made the heroic persons act and talk like ordinary men and women. The finer side of such parody had lost its edge; only broad comedy remained.

The Rhesus is still held by some to be what the dithyramb and the grammarians call it—a work of Euripides; and Paley has ably supported this view. But the skepticism first declared by Valcknaer to Literary has gained ground, and the Rhesus is now almost universally recognized as spurious. The art and the style, still more evidently the feeling and the mind, of Euripides are absent. 'If it cannot be ascribed to the work of an Athenian, a poet should have a fresh finding for the nature of the art parodied. It is because Euripides was not in accord with the spirit of the heroic myths that he is not strong in mythic travesty. His own tragedies—such as the Helen, the Electra, the Amphitryon—have, and over several years, contributed to destroy the meaning of satyric drama. They had done gravely very much what satyric drama aimed at doing grotesquely. They had made the heroic persons act and talk like ordinary men and women. The finer side of such parody had lost its edge; only broad comedy remained.'

When the first protests of the comic poets were over, Euripides was secure of a wide and lasting renown. As the old life of Athens passed away, as the old faiths lost their meaning and the peculiarly Greek instincts in art lost their truth and freshness, Aeschylus and Sophocles might cease to be enjoyed save by a few; but Euripides could still charm by qualities more readily and more universally recognized. The comparative nearness of his diction to the idiom of ordinary life rendered him less attractive to the grammarians of Alexandria than authors whose erudition form afforded a better scope for the display of learning or the exercise of ingenuity. But there were two aspects in which he engaged their attention. They loved to trace the variations which his style underwent in his different works; and they formed some probable conjectures as to the arrangement of his work from the numerous interpolations which often then had resulted from his popularity on the stage. Philochorus (about 360–260 B.C.), best known for his Attic, dealt, in his treatise on Euripides, especially with the mythology of the plays. From 300 B.C. to the age of Augustus a long series of critics busied themselves with this poet. The first systematic arrangement of his reputed works is ascribed to Dicacearchus and Callimachus in the early part of the 3rd century B.C. Among those who furthered the exact study of his text, and of whose work some traces remain in the extant scholia, were Aristophanes of Byzantium, Callistratus, Apollodorus of Tarsus, Timachidas, and pre-eminent Dimus; probably also Crates of Pergamum and Aristarchus. At Rome Euripides was early made known through the translations of Ennius and the freer adaptations of Paucius. When Hellenic civilization was spread through the East, the mixed populations of the new settlements welcomed a dramatic poet whose style and whose sentiment were not too severely or exclusively Attic. The Parthian Oedipus and his court were witnessing the Bacchae. In Persia, it is not unlikely that the scene of frenzied triumph by displaying the gory head of the Roman Crassus. Mommsen has noted the moment as one in which the power of Rome and the genius of Greece were simultaneously abased in the presence of sultanism. 'So far as Euripides is concerned, the incident may suggest another and a more pleasing reflection; it may remind us how the charm of his human genius had penetrated the recesses of the barbarian East, and had brought to rude and fierce peoples at least some dim and distant apprehension of that gracious world in which the great spirits of ancient Hellas had moved. A quaintly significant testimony to the popularity of Euripides is afforded by the reference to his plays in Xenophon's Anabasis. The drama, narrating the events which preceded and attended the Passion, is a centre of no less than 2610 verses, taken from the plays of Euripides, principally from the Bacchae, the Troades and the Rhodis. The traditional ascription of the authorship to Gregory of Nazianzus is now generally rejected; another conjecture assigns it to Apollinaris of Laodicea, and places the date of composition at about A.D. 330. Although the text used by the author of the cento may not have been a good one, the value of the piece for the diplomatic criticism of Euripides is necessarily very considerable; and it was diligently used both by Valcknaer and by Porson.

Dante, who does not mention Aeschylus or Sophocles, places Euripides, with the tragic poets Antiphon and Agathon, and the lyrist Simonides, in the first circle of Purgatory (xxii. 106), among those

pide Greci, che gia di lauro ornar la fronte.'

Casaubon, in a letter to Scaliger, salutes that scholar as worthy to have lived at Athens with Aristophanes and Euripides—a compliment which certainly implies respect for his correspondent's poetic and dramatic works. In his translation, too, where Aeschylus and Sophocles were yet little known, he made the 19th and 17th centuries to testify to the favour bestowed upon Euripides. G. Gascoigne's and Francis Kinwelmesh's Jocaste, played at Gray's Inn in 1566, is a literal translation of Lodovico Dolce's Giocasta, which derives from the Phoemissia, probably through the Latin translation of R. Winter (Basel, 1541). Among early French translations from Euripides may be mentioned the version of the Iphigenia in Tauris by Thomas Siblet in 1549, and that of the Hecuba by Bouchetel in 1550. About a century later Racine gave the world his Andromaque, his Iphigénie and his Phédre; and many have held that, at least in the last-named of these, "the disciple of Euripides" has excelled his master. Bernhardy notices that the performance of the Hippolytus at Berlin in 1851 seemed to show that, for the modern stage, the Phédre has the advantage of its Greek original. Racine's great English contemporary seems to have known and to have liked Euripides better than the other Greek tragedians. In the Reason of Church Government Milton certainly speaks of "those dramatic constitutions in which Sophocles and Euripides reign;" in the paraphrase of the three tragic poets, "these three tragic poets are equally the subject of praise, yet by any." But the Samson Agonistes itself clearly shows that Milton's chief model in this kind was the dramatist whom he himself has called—as if to suggest the skill of Euripides in the delineation of pathetic women—"so Electra's poet;" and the verse bears a special mark of this preference in the use of Euripidean monodies. In the second half of the 19th century such men as J. J. Winckelmann (1717–1768) and G. E. Lessing (1729–1781) gave a new life to the study of the antique. Hitherto the art of the old world had been better known through Roman than through Greek interpreters. The basis of the revived classical taste had been Latin. But now men gained a finer perception of those characteristics which belong to the Greek work of the great time, a fuller sense of the difference between the Greek and the Roman genius where each is at its best, and generally a clearer recognition of the qualities which distinguish ancient art in its highest purity from modern romantic types. Euripides now became the object of criticism from a new point of view. The same it is with Aeschylus and Sophocles as representatives of that ideal Greek reason, a form and the purest type of sculpture. Thus tried, he was found wanting; and he was condemned with all the rigour of a newly illuminated zeal. B. G. Niebuhr (1776–1831) judged him harshly; but no critic approached A. W. Schlegel (1767–1845) in severity of one-sided censure. Schlegel, in fact, will scarcely allow that Euripides is tolerable except by comparison with Racine. L. Tieck (1773–1853) showed truer appreciation for a brother artist when he

(According to Karl Krumbacher, Gesch. der byz. Lit., it is an 11th-century production of unknown authorship.)
described the work of Euripides as the dawn of a romantic poetry haunted by dim yearnings and forebodings. Goethe—who, according to Bernhardy, knew Euripides only as a great poet, certainly admired him highly, left an interesting memorial of Euripidean study in his attempted reconstruction of the lost Phaëthon. There are some passages in Goethe's conversations with Eckermann which form effective quotations against the Greek poet's real or supposed detractors. "To feel and respect a great personality, one must be something oneself. All those who denied the sublime to Euripides were either poor wretches incapable of comprehending such sublimity or shameless charlatans who, in their presumption, wished to make more of themselves than they were." "A poet whom Socrates called his friend, whom Aristotle lauded, whom Alexander admired, and for whom Sophocles and the city of Athens put on mourning on hearing of his death, must certainly have been some one. If a modern man like Schlegel must pick out faults in so great an ancient, he ought only to do it upon his knees" (J. A. Symonds, Greek Poets, i. 230).

We yield to no one in admiration of Goethe; but we cannot think that these rather bullying utterances are favourable examples of his method in aesthetic discussion; nor have they any logical force except as against those—if there be any such—who deny that Euripides is a great poet. One of the most curious and most interesting of criticisms on Euripides is the very short poem in his history of Rome (bk. iii. ch. 14).

It is, in our opinion, less than just to Euripides as an artist. But it indicates, with true historical insight, his place in the development of his art, the operation of those external conditions which made him what he was, and the nature of his influence on succeeding ages.

The manuscript tradition of Euripides has a very curious and instructive history. It throws a suggestive light on the capricious nature of the process by which some of the greatest literary treasures have been saved or lost. Nine plays of his are of select collections; nine, of the eighteenth, are in the small number of the extant dramas, are universally allowed to be of very inferior merit—to say nothing of the Rheus, which is generally allowed to be spurious. On the other hand, the list omits at least three plays of first-rate beauty and excellence, the very flower, indeed, of his art—namely, the Iphigenia in Aulis, the Iphigenia in Tauris, and the Bacchae—the last certainly, in its own kind, by far the most splendid work of Euripides that we possess. Had these three plays been lost, it is not too much to say that the whole estimation of our knowledge of Euripides would have been modified. But all the ten plays not included in the select list had a narrow escape of being lost, and, as it is, have come to us in a much less satisfactory condition.

A. Bonf harms was the first, in his editions, thoroughly to investigate the history and the affinities of the Euripidean manuscripts.1 All our MSS. are, he thinks, derived from a lost archetype of the 9th or 10th century, which contained the nineteen plays (counting the Rheus) now extant. From this archetype a copy, also lost, was made about A.D. 1100, containing only the nine select plays. This copy became the source of all our best MSS. for those plays. They are—(1) Marcianus 471, in the library of St Mark at Venice (12th century); (2) Amsterdam, Bacchae (8th century); (3) Venice, Iphigenia in Aulis; (4) Vaticanus 909 (12th century), nine plays; (5) Parisinus 2712, 13th century, 7 plays (all but Troades and Rheus). Of the same stock, but inferior, are (4) Marcianus 468, 13th century; (5) Venetus A. (v. 1-42), one of the best MSS. of all (from the 12th century, according to Paley); (6) Parisinus 298 (9th century), a late transcript of a MS. resembling Vat. 999, nine plays. A second family of MSS. for the nine plays, sprung from the same copy, but modified by a Byzantine recension of the 13th century, is greatly divergent.

The other ten plays have come to us only through the preservation of two MSS., both of the 14th century, and both ultimately derived, as Kirchhoff thinks, from the archetype of the 9th or 10th century. These are (1) Copenhagen 289 (13th century), containing all or near all the thirteen plays, viz. seven (the select plays Androm., Med., HIPP., Alc., Troad.), and seven others—Bacchae, Cyclops, Heracleides, Supplices, Iph., Iphigenia in Aulis, Iphigenia in Tauris; and (2) Flor. Pal. C., eighteen plays, viz. all but the Troades. This MS. is, thus the only one for the Helenae, the Electra, and the Hercules Furens. By far the greatest number of Euripidean MSS. contain only three plays—Hecuba, Orestes and Phoenissae—these having been chosen out of the select nine for school use—for probably in the 14th century.

It is to be remembered that, as a selection, nine of the plays are included in the two editions of R. V. Turski2 and those of Sophocles which also belong to the 18th. If, then, these MSS. did not include the Iphigenia in Tauris, the Ion or the Bacchae, we may not fairly infer that the lost plays of the other two dramatists comprised works at least equal to any that have been preserved. May we not question the reliability of the two MSS., and the authenticity of the plays by which their highest excellence should have been judged?

The extant scholia on Euripides are for the nine select plays only. The first edition of the scholia on seven of these plays (all but the Troades and Rheus) was the work of V. Dindorf, and the complete edition is that of W. Dindorf (1863).3 The collection, though loaded with rubbish—including worthless analyses of the lyric metres by Demetrius Trichinus—includes some invaluable comments derived from the Alexandrian critics and their followers.

Editiones Principes.—1496. J. Lascaris (Florence), Medea, Hippolytus, Alcestis, Andromache.

1503. M. Musurus (Aldus, Venice), Eur. Tragg., XVII., to which in vol. ii. the Hercules Furens was added as an 18th; i.e. this edition contained all the extant plays of the Electra, which was first given to the world by P. Victorius from Florentinus c. 1545. The Aldine edition was reprinted at Basel in 1537.

The complete edition of Joshua Barnes (1694) is no longer of any historical value. The first thorough work done on Euripides was by L. C. Valkenaer in his edition of the Phoenissae (1755), and his Diatribe in Eur. perditorum dramatam religiosam (1767), in which he argued against the authenticity of the Rheus.

Editiones. E. Birch's English edition (1735-1771), Supplices, Iphigenia A., Iphigenia T.; Ph. Brunnck (1779-1801), Andromache, Medea, Orestes, Hecuba; R. Porson (1797-1801), Hecuba, Orestes, Phoenissae, Medea; H. Monk (1811-1816), Alcestis, Hecuba; W. H. Dindorf, Iphigenia A., Iphigenia T., Euryalus, Medea (1813-1821), Medea, Bacchae, Heracleidae, Suppl. (a second ed. 1829); G. Hermann (1831-1841), Hecuba (an. i. ed. R. Porson, 1800, Orestes, Alcestis, Iphigenia A., Iphigenia T., Helen, Ion, Hercules Furens; 1854, Medea; A. W. Verrall (1883), Hippolytus, by J. P. Mahaffy (1881): and of the Hercules Furens, by Willamowitz-Moellendorf (2nd ed., 1893), with a comprehensive introduction on the literature of Euripides. A selected list (up to 1896) will be found in J. B. Maynard, Guide to the Study of the Drama in Literature (1896), and C. B. McAlpin, J. A. C. Braun's Jahrbiicher, xxviii. (1897), and for the earlier literature W. Engelmann, Scriptores Graeci (1881). The little volumes on Euripides by J. P. Mahaffy (1879) and W. B. Donne in Blackwood's 'Ancient and Modern History' (1854) are both valuable. See also P. Decharme, Euripide et l'esprit de son théâtre (1893); A. W. Verral, Euripides the Rationalist (1895), and Essays on Four Plays of Euripides (1905); N. J. Patin, Étude sur Euripide (1872); O. Ribbeck, Euripides et seine Zeit; and (for the life of the poet) Willamowitz's ed. of the Hercules Furens (i. 1-42); P. Masqueray, Euripide et ses idées (1908).

Translations.—Among these may be noted the complete verse translation by A. S. Way (1894-1898); that in prose by E. P. Coleridge (1896); and G. G. Murray's verse translations (1902-1906). A literary interest attaches to Robert Browning's 'Translation' of the Alcestis in his Balaustion, and his 'reconstruction of Hippolytus' at Phaethon in the 1840 edition of his works, xxxii. pp. 22-43. (R. C. J.; X.)

Euryclydon (Gr. ἐυροκλύδων, east wind; κλυδων, wave), a stormy wind from the N.E. or N.N.E. in the eastern Mediterranean. Where the Authorized Version of the Bible (Acts xxvii. 14) mentions eurulcdyon, the Revised Version, taking the reading ἐυροκλῦδων, has eurوقλυδων, or north-easter. The word is sometimes used for the Bora (ż).

Europa (or rather, Europe), in Greek mythology, according to Homer (Iliad, xiv. 211), the daughter of Phoenix or, in a later story, of Agenor, king of Phoenicia. The beauty of Europa fired the love of Zeus, who approached her in the form of a white bull and carried her away from her native Phoenicia to Crete, where

1 See also a clear account in the preface to vol. iii. of Paley's edition.

2 New ed. by E. Schwartz (1887-1891).
she became the mother of Minos, Rhadamantys and Sarpedon. She was worshipped under the name of Hellota in Crete, where the festival Hellota, at which her bones, wreathed in myrtle, were carried round, was held in her honour (Atheneaen x. p. 678). Some consider Europa to be a moon-goddess; others explain the story by saying that she was carried off by a king of Crete in a ship decorated with the figure-head of a bull. O. Gruppe (De Cadmi Fabula, 1891) endeavours to show that the myth of Europa is only another version of the myth of Persephone.

See Apollodorus ii. 1; Ovid, Metam. ii. 833; articles by Helbig in Roscher's Lexikon der Mythologie, and by Hild in Darmenbg and Sack's Dictionnaire des antiquités grecques et romaines, 26 in the article Géographie Art (archaic metope from Palermo) represents the journey of Europa over the sea on the back of the bull.

**EUROPE**, the smallest of those principal divisions of the land-surface of the globe which are usually distinguished by the conventional name of continents.

1. Geography and Statistics

It has justly become a commonplace of geography to describe Europe as a mere peninsula of Asia, but while it is necessary to bear this in mind in some aspects of the geography of the continent, more particularly in relation to the climate, the individuality of the continent is established in the clearest manner by the course of history and the resultant distribution of population. The earliest mention of Europe is in the Homeric *Hymn to Apollo*, but there Europe is not the name of a continent, but is opposed to the Peloponnesus and the islands of the Aegean. The distinction between Europe and Asia is found, however, in Aeschylus in the 5th century b.c., but there seems to be little doubt that this opposition was learnt by the Greeks from some Asiatic people. On Assyrian monuments the contrast between *awm*, "(the land of) the rising sun," and *erob or irib*, "(the land of) darkness" or "(the setting sun," is frequent, and these names were probably passed on by the Phoenicians to the Greeks, and gave rise to the names of Asia and Europe. Where the names originated the geographical distinction was clearly marked by the intervention of the sea, and this intervention marked equally clearly the distinction between Europe and Libya (Africa). As the knowledge of the world extended, the difficulty, which still exists, of fixing the boundary between Europe and Asia where there is land connexion, caused uncertainty in the application of the two names, but never obscured the necessity for recognizing the distinction. Even in the 3rd century b.c. Europe was regarded by Eratosthenes as including all that was then known of northern Asia. But the character of the physical features and climate finally determined the fact that what we know as Europe came to be occupied by more or less populous countries in intimate relation with one another, but separated on the east by unpeopled or very sparsely peopled areas from the countries of Asia, and the boundary between the two continents has long been recognized as running somewhere through this area. Within the limits thus marked out on the east and on other sides by the sea the climatic conditions are such that inhabitants are capable of and require a civilization of essentially the same type, based upon the cultivation of our European grains."1 Those inhabitants have had a common history in a greater measure than those of any other continent, and hence are more thoroughly conscious of their dissimilarities from, than of their consanguinity with, the peoples of the east and the south.

On the subject of the boundaries of Europe there is still divergence of opinion. While some authorities take the line of the Caucasus as the boundary in the south-east, others take the line of the Manych depression, between the upper end of the Sea of Azov and the Caspian Sea, nearly parallel to the Caucasus. Various limits are assigned to the continent on the east. Officially the crest of the Caucasus and that of the Urals are regarded in Russia as the boundaries between Europe and Asia on the south-east and east respectively, although in neither case does the boundary correspond with the great administrative divisions, and in the Urals it is impossible to mark out any continuous crest. Reclus was out attempting to assign any precise position to the boundary line between the two continents, makes it run through the relatively low and partly depressed area north of the Caucasus and east of the Urals. The Manych depression, marking the lowest line of this area to the north of the Caucasus, has been taken as the boundary of Europe on the south-east by Wagner in his edition of Guthe's *Lehrbuch der Geographie*, and the same limit is adopted in Kirchoff's *Länderkunde des Erdeits Europas* and Stanford's *Compendium of Geography and Travel*. In favour of this limit it appears that much weight ought to be given to the consideration put forward by Wagner, that from time immemorial the valleys on both sides of the Caucasus have formed a refuge for Asiatic peoples, especially when it is borne in mind that this contention is reinforced by the circumstance that the steppes to the north of the Caucasus must interpose a belt of almost unpeopled territory between the more condensed populations belonging undoubtedly to Asia and Europe respectively. Continuity of population would be an argument in favour of assigning the whole of the Urals to Europe, but here the absence of any break in such continuity on the east side makes it more difficult to fix any boundary line outside of that system. Hence on this side it is perhaps reasonable to attach greater importance to the fact that the Urals form a boundary not only orographically, but to some extent also in respect of climate and vegetation, and on that account to take a line following the crest of the different sections of that system as the eastern limit between the two continents.8 Obviously, however, any eventual agreement among geographers on this head must be more or less arbitrary and conventional. In any case it must be borne in mind that, whatever conventional boundary be adopted, the use of the name "Europe" as so limited must be confined to statements of extent or implying extent. The facts as to climate, fauna and flora have no relation to any such arbitrary boundary, and all statistical statements referring to the countries of Europe must include the part of Russia beyond the Urals up to the frontier of Siberia. In such statements, however, in the present article the whole of the lieutenancy of the Caucasus will be left out of account. As to extent it is provisionally advisable to give the area of the continent within different limits.

The following calculations in English square miles (round numbers) of the area of Europe, within different limits, are given in Behm and Wagner's *Bevölkerung der Erde*, No. viii. (Gotha, Justus Perthes, 1891), p. 53:—Europe, within the narrowest physical limits (to the crest of the Urals and the Manych depression, including the Sea of Azov, but excluding the Caspian Steppe, Iceland, Novaya Zemlya, Spitsbergen and Bear Island) 3,570,000 sq. m. The same, with the addition of the Caspian Steppe up to the Ural river and the Caspian Sea, 3,687,750 sq. m. The same, with the addition of the area between the Manych depression and the Caucasus, 3,790,500 sq. m. The same, with the addition to the east of the Ural Mountains, the portion of the Caspian Steppe east of the Ural river as far as the Emba, and the southern shores of the Caspian Sea, 3,910,000 sq. m.

---

2 At the summit of each of the Trans-Ural railways (Perm-Tyumen and Ufa-Chelyabinsk) and that of the road across the Caspian Sea from Vladivostok via the sign-posts, with the name Europe on one side, Asia on the other, mark this boundary.
4 'Pt. i. pp. 11-12.
5 Griesbach, on the strength of Middendorff's observations, remarks that in addition to European fruit trees, oaks, elms, ashes and the black alder do not cross the Urals, while the lime tree is reduced to the size of a shrub (La Végétation du globe, translated by Tchatchef, i. p. 181).
6 The boundary between Asia and Europe see F. G. Hahn in the Mitteilungen des Vereins für Erdkunde zu Leipzig (1881), pp. 83-104. Hahn, on the ground that true mountain systems must be regarded as forming geographical units, pronounces against the practice of making "natural boundaries run along mountain crests, and assigns the whole of the Caucasus region to Europe as all belonging to such a system, but orographically quite different from the Armenian plateau (p. 103). But surely it is no less different from the European plain.
of the Mediterranean in the early centuries of the Christian era, is now 7 m. from the coast, and Adria, which gives its name to the sea, is 13. The islands on which Venice is built have sunk about 3 ft. since the 10th century. The pavement of the square of St Mark's has been raised, and on the island of Murano, it has been discovered that a layer of vegetable remains, indicating a flora identical with that observed on the neighboring mainland, exists at a depth of 300 ft. below the alluvial deposits. A little to the south of Rogovina, the water is 65 ft. deep and in the vicinity of the town of Dalmatia, at a depth of about 85 ft. the remains of a town, which has been identified with the island town of Cissa, of which nothing had been known after the year 569. At Zara ancient pavements and mosaics and tombs have been discovered, showing that the title of the ancient town of Narenta has been changed into a swamp by the advance of the sea. A process of elevation, on the other hand, is indicated along nearly all the coasts of Sicily, at the southern end of Sardinia, the east of Corsica, and perhaps in the neighborhood of the island of Sizil. Such examples, however, are very rare, though the land was still 16 ft. higher than now. A more rapid depression began in the middle ages, so that the sea-level rose from 18 to 20 ft. above the present zero, and the coast began gradually to rise again at the close of the 15th century. Passing westward to the Balkan peninsula, we find considerable changes on the coast-line of Greece; but as they are only repetitions on a smaller scale of the phenomena already described, it is sufficient to indicate the rise of the coasts of Thessaly and the Peloponnesus, and the changes of coast-line there have been, it is generally believed, due to the action of tides. The latter especially is interesting to the historian as well as to the geologist, as the river has greatly altered the physical features of one of the world's most famous scenes—the battlefield of Thermopylae.

In the Atlantic seaboard we observe, as we might expect, great modifications in the embouchures of the Garonne and the Loire, but by far the most remarkable variations of sea and land have taken place in the region extending from the south of Belgium to the north of France, and by the coasts of the Elbe and the west coast of Schleswig-Holstein. Here there has been a prolonged struggle between man and nature, for the whole nature of hitherto had the best of the battle. While, as we have seen, the coasts of England and other countries where the sea has been protected against the sea by dikes and reclaimed, and the coast-line has been, on the whole, advanced between the Elbe and the Elster, there has been a great loss of land in the interior of Holland since the 13th century. Thus a large part of the region of land north of the Elster since the first half of the 13th century. In the 1st century A.D. the Zuider Zee appears to have been represented only by a comparatively small inland lake, the dimensions of which were increased by the intervention of the Zuider Zee at the beginning of the 13th century. Among the local changes of European significance within this area may be mentioned the siting up towards the end of the 15th century of the channel known as the Zwin running north-eastwards from Bruges, which through that cause was hitherto and in the end all its former renown as a seat of commerce.

The Baltic shores of Germany display the same phenomena of local gain and loss. In the western section inroads of the sea have been extensive: the islands of Rügen would no longer exist if the disembarkation of an army like that of Gustavus Adolphus; Wollin and Usedom are growing gradually less; large stretches of the mainland are fringed with submerged forests; and at intervals within view are well-known villages are occupied by the sea. On the other hand, the east, the great rivers are successfully working in the opposite direction. In the Gulf of Danzig the alluvial deposits of the Vistula cover an area of 615 sq. m.; in the 13th century the knights of Marburg estimated that more than 200 sq. m. of this area, about 70 sq. m. was added in the course of the 14th. The Memel is sitting up the Kurisches Haff, which, like the Frisches Haff, is separated from the open sea by a line of dunes comparable with those of the Landes. The coast-line at Klaipeda has been raised so as to enclose the lake which covered the Scandinavian peninsula, though belonging for the most part to glacial times, speak also of relative changes of level in the post-glacial period.

The changes briefly indicated above take place so gradually for the Coastal line is given in the table of Sea-level so that the establishment of their reality is very different with those changes which we usually ascribe to volcanic activity. Besides the great outlying "hearts" of Iceland, there are the occasional "scarcities" of the coast-line of St. John, all of them, however, situated in the Mediterranean. Vesuvius on the western coast of Italy, Etna in the island of Sicily, and Stromboli

### GEOPOLITICS

Europe

The region was evidently highly volcanic at an earlier period, for Milne has noted, in his Klyazma (1889), as many as 378 volcanoes, with the highest peaks above 15,000 ft.: 2 (3) the Sierra Nevada, Nevada, the Pyrenees, and Etna, about 11,000 ft.; (3) the Alps and Carpathians, especially the intra-Carpathian, the Pyrenees, the Carpathian, the Balkans, and the Aegean Archipelago, from 8000 to 9000; (4) the Carpathians, the Pyrenees, the Carpathian, the Balkans, and the Cevennes, between 6000 and 8000; (5) the mountains of Auvergne, the Jura, the Riesengebirge, the mountains of Sardinia, Majorca, Minorca, and the Crimea, the Black Forest, the Voges, and the Scotch Highlands, from 4000 to 6000.

### RELIEF

The great European plains in its widest sense, 2,600,000

The second largest is that of inland seas, 2,300,000

The third largest is that of the Russian plains, 2,000,000

The fourth largest is that of the Russian plains, 2,000,000

The fifth largest is that of the Russian plains, 2,000,000

The sixth largest is that of the Russian plains, 2,000,000

The seventh largest is that of the Russian plains, 2,000,000

The eighth largest is that of the Russian plains, 2,000,000

The ninth largest is that of the Russian plains, 2,000,000

The tenth largest is that of the Russian plains, 2,000,000

Several estimates have been made of the average elevation of the continent, but it is not enough to give the main results. In the following list, where a conversion from metres into feet has been necessary, the figures have been given in both units.

8 Morphologie der Erdoberfläche, vol. i.

9 Klyazma (1889), as many as 378 volcanoes, with the highest peaks above 15,000 ft.: 2 (3) the Sierra Nevada, Nevada, the Pyrenees, and Etna, about 11,000 ft.; (3) the Alps and Carpathians, especially the intra-Carpathian, the Pyrenees, the Carpathian, the Balkans, and the Cevennes, between 6000 and 8000; (5) the mountains of Auvergne, the Jura, the Riesengebirge, the mountains of Sardinia, Majorca, Minorca, and the Crimea, the Black Forest, the Voges, and the Scotch Highlands, from 4000 to 6000.

10 The following are based on those contained in the fifth edition, by Dr Hermann Wagner, of Gunk's Lehrbuch der Geographie. In the original the figures are given in German sq. m. and in whole numbers, and the equivalents here given in English sq. m. are similarly treated.
THE observations on the temperature of European rivers have been collected and discussed by Dr Adolf E. Förster. He finds that the dominant factor in determining that temperature is the temperature of the air above that of the rivers flowing from glaciers, in which the temperature is warmer than the air in winter, colder in summer; rivers flowing from lakes, characterized by peculiarly high winter temperatures, in consequence of which the mean temperature of the year is greatly above that of the air; rivers flowing from springs, which, at least near their source, are more rapidly cooled by low and warmed by high air temperatures; and rivers of the plains, which have a higher mean temperature than the air in all months of the year.

In various parts of Europe, more particularly in calcareous regions, such as the Jura, the Causses in the south-east of France, and the Karst in the north-west of the Balkan peninsula, there are numerous subterranean streams, which flow through karstic rocks. Several of the more important rivers are of very irregular flow, and some are subject to really formidable floods. This is particularly the case with rivers that have a large part of their basin made up of crystalline or other impervious rocks. With such rivers, one, like those of the Luthe in France and the Ebro in Spain. The Danube and its tributaries, the great rivers of Germany, above all eastern Germany, and those of Italy, are also notorious for their inundations. In southern Europe, where the summers are nearly rainless, most of the rivers disappear altogether in that season.

For many European lakes, especially the smaller ones, estimates have been made of the mean depth and the volume. A list of all the European lakes for which the altitude, extent, and greatest depth could be ascertained, compiled by Dr K. Penck, is published, in *Geogr. Zeitschrift* (1866), pp. 606-616, where estimates of the mean depth and the volume are also given where procurable. The table given above, comprising only the larger lakes, is mainly based on this list, where the original authorities are mentioned. The figures entered in the table not taken

1. In other parts of this work areas of river-basins and lakes, and other measurements, may be observed to conflict in some degree with those given here. Various authorities naturally differ, both in methods of estimating and in standards of precision.

---

GEOGRAPHY

EUROPE

Referring to not only have more or less well-marked breaks between them, but are themselves so altered by passes and cut by transverse valleys as to present great facilities for crossing in proportion to their average altitude. The first and second of these points have special importance with reference to the problem to be considered more fully under that head.

The second river is of importance with reference to the means of communication, to which, of course, the third also refers, and detailed consideration of these points in that relation will be reserved for that heading. Here, however, it may be said that the islands of the Mediterranean, which is a general trend from south-west to north-east, and is completely detached by seas and plains from the highland area to the south. There are also completely detached highland areas, as the Jura and the Vneil range in the south of the Crimea, and the Mediterranean islands.

The connected series of highlands is that which extends from the Iberian peninsula to the Black Sea, stretching in the middle of Germany northwards to about 52° N. In the Iberian peninsula we have the most marked example of the tableland form in Europe, and these tablelands are bounded on the north by the Cantabrian Mountains which descend to the sea, and the Pyrenees, which, except at their extremities, cut off the Iberian peninsula from the adjoining country more extensively than any other chain in the continent. Between the foot-hills of the Pyrenees, however, and those of the central plateau of France the ground sinks in the Passage of Nauroue or Gap of Carcassonne to an elevation clear of the highest mountain, and establishes easy communication between the river of the Gironne and the lower part of that of the Rhone. The highlands in the north spread northwards and then south-eastwards till they join the Vosges, but sink in elevation towards the north-east so as to allow of several easy crossings. East of the Vosges the Rhine valley forms an important area running north and south through the highlands of western Germany. To the south of the Vosges again undulating country of less than 1500 ft. in elevation, the well-known Burgundy, the Gap of Belfort, constitutes a well-marked break between the mountains and the Jura, and establishes easy communication between the Rhine and the Saône-Rhône valleys. The latter valley divides in the south in a manner similar to the highland of France from both the Alps and the Jura, while between these last two systems there lies the wedge of the Swiss midlands contracting southwards till it reaches the Vosges, and the elevation of the Lake of Geneva between the Alps and the mountains of the Italian and Balkan peninsulas the orographical lines of communication are less distinct, but on the north the valley of the Danube mostly forms a wide separation between the Alps and the mountains of the Balkan peninsula on the south-western sides of Bohemia and Moravia, the Carpathians and the Transylvanian Alps on the north. The valleys of the Eger and the Elbe form distinct breaks in the environment of Bohemia, and the Saale in the north-eastern Bohemia and Moravia are even more clearly divided from the Carpathians by the valley of the upper Oder, the Moravian Gate, as it is called, which forms the natural line of communication between the south-east of Prussia and Saxony.

An estimate has been made by Strelbitsky of the length and authority of the basin of all the principal rivers of Europe. In the table on p. 909 all the estimates given without any special reference have been collected; it should be mentioned that the estimates of length made by him evidently do not take into account minor windings, and are therefore generally less than those given by others. The authorities are separately cited for the originals of all other figures given in the table.

---

2. Including L. Piskov as well as the connecting arm known as Tepole
from this list are after Sroblinsky, the \( \text{Cég. Universelle of V. de St Martin, or, in the case of Swedish lakes, from the official hand-} \\
book of Sweden.1

The Alpine lakes break up into a southern and northern sub-division: the former consisting of the Lago Maggiore, and the latter of Lugano and Como, Lago d'Iseo, and Lago di Garda, all connected by affluents with the system of the Po; and the latter the Lake of Geneva threaded by the Rhone, Lakes Constance, Zürich, Neuchâtel, Biel and other Swiss lakes belonging to the basin of the Rhine. These two sub-divisions were formed in the Tertiary. The north Russian lakes, Ladoga, Onega, &c., are mainly noticeable as the largest members of what in some respects is the most remarkable system of lakes in the continent—the Finn-Russian, which contains the largest number of lakes, and which has, along with the lakes of Sweden. The Scandinavian Mountains, or Uppland, formed the surface of a granitic plateau. In Finland proper they occupy less than a tenth of the total area.

A few of the number are very shallow. The Neusiedler See, for example, is only 5 fathoms deep. These lakes have been an essentially continental feature. The Pannonian plain, in Hungary, and the lake-mass in the south of Russia is the Russian lakes, have developed the basin of the Rhine. England, France, and the Low Countries present a similar feature to the basin of the Rhine. The Scandinavian Mountains, or Uppland, formed the surface of a granitic plateau. In Finland proper they occupy less than a tenth of the total area.

The geological history of Europe is, to a large extent, a history of the formation and development of great mountain systems. Four times a great mountain range has been raised across the area which now is Europe. Three times the mountain range has given way: portions have sunk beneath the sea, and have been remade; the fourth mountain range is still maintained standing and now rise as isolated blocks above the later beds which surround them. The last of the mountain ranges still stands, and is known under the names of the Alps, the Carpathians, the Balkans, and the mountain chain. These mountain ranges have been thrown up a number of times, as an ordinary arch would fracture; and some portions fall inward, while other portions may be raised above, or even be raised above. Where, on the other hand, the crust is made of softer rock, it crumbles and folds, and forms a mountainous chain. Such a mountain chain, for want of a better term, is called a folded mountain chain. The folding is most intense where a flexible portion of the crust lies next to a more rigid portion. Where the folding has occurred, the rocks which were once comparatively soft become hard and rigid, and the next series of waves are usually formed beyond the limits of the old one. This is what has happened in the European area.

The oldest mountain chain lay in the extreme north-west of Europe, and its relics are seen in the outlying Hebrides, the Lofoten Islands, and the Faeroes. It seems to have been thrown up inaggiarina, completely dried up in 1693, 1738 and 1864, and left its bed covered for the most part with a deposit of sand.2 Lakes Copais in Boeotia and Fusino Celano in Italy have been entirely turned into dry land. The progress of agriculture has greatly diminished the extent of marsh land in Europe. The Minsk marshes in Russia form the largest area of this character still left, and on these large encroachments are gradually being made. Extensive marshes in northern Italy have been completely drained. The valley draining the Pons from the north of France in Italy made Pope Pius VII. famous in the 18th century, and further reclamation works are still in progress there and elsewhere in the same country.

The Jurassic and Cretaceous periods were free from any violent folding or mountain building, and the sea again spread over a large part of the northern continent. There were indeed several oscillations, but in general the greater part of northern and central Europe lay under the sea, which gradually encroached upon the northern part of the continent. Under this sea the Europ-ian chain still rose as islands above the waves, and at certain periods there seems to have been a more or less complete barrier between the waters which covered central Europe and those which lay in the north. The basinal deposits of the Upper Jurassic and Lower Cretaceous were laid down in England and Germany, the purely marine Tithonian formation, with its peculiar fauna, was deposited in the south; and which later, in the north of Europe, the Hippuritic limestone was laid down in the south.

The Tertiary period saw fundamental changes in the geography of Europe. The formation of the great mountain ranges of the south, the Alps, in the region of Greece, perhaps began at an earlier date than the northern part. The upheaval was in the Eocene and Miocene periods that the chief part of the elevation took place. Arms of the sea extended up the valley of the Rhone and around the northern margin of the Alps, and also spread over the plains of Hungary and of southern Russia. Towards the middle of the Miocene period some of these arms were completely cut off from the ocean and large deposits of salt were formed, as at Wieliczka. At a later period south-eastern Europe was covered by a series of extensive lagoons, and the waters of these lagoons gradually dried up, and the basins were finally converted into dry land. Great changes also took place in the Mediterranean region. The Black Sea, the Aegean, the Adriatic and the Tyrrhenian Sea were all formed at various times during the early Tertiary period. The basins of the Swiss lakes and the basins of the Alps, which are connected with the elevation of the neighbouring mountain chains, accordingly, to some extent, the elevation of Europe.

1 Sweden, its People and its Industry (Stockholm, 1903).
whole of the northern part of the continent. With the final melting and disappearance of the ice-sheet, the topography of Europe assumed nearly its present form, and man came upon the scene. Minor changes, such as the separation of Great Britain from the continent, may have occurred at a later date; but since the Glacial period there have, apparently, been no fundamental modifications in the configuration of Europe.

The elevation of each of the great mountain systems already described, and the depression to which they have been reduced, by the action of the climates which have characterized the periods of the great ice ages and the sequence appears to have been similar in every case. The volcanoes of the Mediterranean are the last survivors of the great eruptions which accompanied the elevation of the Alpine mountain system.

In western Europe by far the most prevalent wind is the S.W. or W.S.W. It represents 35% of the annual total; while the N. is 9%, N.E. 20%, E.E. 8%, E. 7%, S.E. 7%, W. 21% and N.W. 17.

**Winds.**

In south-eastern Europe, on the other hand, the prevailing winds are from the N. and N.E. In the vicinity of the former is also the main body of the air which produces the rain which descends on a northerly or easterly wind, and thus cause rain on the northern or eastern side of the mountain. Still, any rainfall map of Europe indicates clearly enough the origin of the water-vapour to which the rainfall is attributed. So far as a glance into the results of more detailed investigations of different parts of the world is concerned, the map by Joseph Reger. This map shows the rainfall or rather total precipitation in seven tints at intervals of 250 mm. (about 10 in.) from 0 to 1000 mm., and beyond that at intervals of 500 mm. up to 2000 mm. In some parts of the continent the limits of a rainfall of 200 mm. and 600 mm. are also shown. The picture there given is too complicated for brief description except by saying quite generally that it shows on the whole a diminution in the total amount of precipitation from the south to the north. The map of the whole of Europe is indicated on the west or south and most exposed sides of mountains. The areas of scantiest rainfall lie to the north and north-west of the Caspian Sea and in the interior of the Kola Peninsula, north-west of the Arctic Ocean; and in Spitsbergen, where, with a some 2 m. and 650 ft. higher than Spitsiwaite, has long been reputed to be the station recording the heaviest rainfall in Europe, but which has been shown by an article in Crackle, an immediate and last estimate of the south-west of France and the west of England. In the period 1881-1890 the average rainfall at the Stye amounted to 177 in., in 1891-1900 that at Crackle amounted to about 179 in.

The amount of the snowfall as distinguished from the rest of the precipitation is now considered in its own proper place. The surface distribution of the rainfall of Europe has received attention from Drs A. J. Herbertson, Köppen and Suman, and Mr A. Angot. The rainfall of each month in Europe as in the other continents is shown by Dr A. J. Herbertson in _The Distribution of Rainfall over the Land._

On plate 19 of the _Atlas of Meteorology_, by J. G. Bartholomew and A. J. Herbertson, Dr Köppen has furnished maps showing the months of maximum rainfall and the seasons of maximum and minimum rainfall. Mr A. Angot's work on the subject is published in two papers in the _Annales du bureau central météor., de France_, a series of memoirs in which the rainfall observations of Europe for the years 1861-1890 have been published. These papers (1893, pp. 157-194) deals with the Iberian Peninsula, the south (1893, B. P., pp. 155-192) with western Europe (from about 43° to 58° N. and as far east as about 19° to 21° E.). Both papers are accompanied by maps showing six times the mean rainfall for each month as well as for the entire year; and that on western Europe, by maps extended in the west as far south as Avila, the proportion of the rainfall occurring during the winter, spring, autumn and summer months respectively. But the most instructive maps on the subject embarking on a new investigation of the subject. He shows the percentage of the total rainfall of the year occurring in spring, summer, autumn and winter respectively. From the maps it appears that all the southern and western coasts of Europe have a long annual rainfall. But there are considerable differences between the eastern and the western coasts of Europe, the existence of the continent of Asia has a marked effect on the climate which also aids in giving to Europe its individual character. It is owing to that circumstance that the south is so much wetter, south coasts of Europe which are quite as prevalent the ocean to agriculture as the corresponding latitudes of eastern Asia or eastern North America, is without the copious rains which make those temperatures so valuable, and hence forms part of the desert that divides the populations of Europe and Asia.

1. Vесeslovski, as quoted by Vеoilov, _Die atmosphärische Circulation._
3. London, 1901 (one of the publications of the Royal Geog. Society).
4. Plate 21 in _Petermanns Mitteilungen_ (1900).
and extends eastwards, while the Mediterranean region generally is one of rainy winters and relatively dry summers. The consequence is that with similar conditions of soil and superficial configuration the Mediterranean region is agriculturally much less productive, except where there are means of irrigation, than the corresponding parts of central Europe, where there are corresponding summer temperatures but an opposite seasonal distribution of rainfall.

In connexion with the seasonal distribution of rainfall may be noted the strong westerly winds of winter, and, in the south from the influence of the Loire and Allier to the mouths of the Danube.

The temperature of the continent has been illustrated by Dr Supan in an interesting series of maps based on actual observations not only of the periods within which the mean daily temperature lies within certain ranges (at or below \(32^\circ\) F.; \(50^\circ-68^\circ\) F.; above \(68^\circ\) F.). The first of these maps strikingly illustrates the effect on temperature of the strong westerly winds of winter, and, in the south, the influence of the Mediterranean Sea as well as the protection afforded to the Mediterranean countries against cold winds from the north by the barrier of mountains. South of the parallel of \(60^\circ\) there is no lowland area in the west of Europe where the average monthly temperature is at any time above \(5^\circ\) for more than a month, and in the Mediterranean region only the higher parts of the mountains besides the northern part of the Balkan Peninsula are characterized by such prolonged frosts. On the other hand, on the 

![Map illustrating cloud-distribution in central Europe](https://example.com/map)

**Temperature.**

The second map illustrating the duration of average daily temperatures between \(50^\circ\) and \(68^\circ\) F., that is, the temperatures favoring the growth of wheat and vegetables, is of much interest. It shows that the duration of such temperatures increases from the south to north, and that by far the greater part of the continent south of \(53^\circ\) N. has at least six months within those limits, and that the boundary does not run through the centre of Europe. This, despite the fact that the high temperatures which it illustrates are prolonged for a month or more throughout the Mediterranean region, but outside of that region hardly anywhere except in the south-western plains of France, there is only a very small area of the continent south of \(53^\circ\) N. Without doubt an important cause of the prolonged duration of high temperatures in this last area is the relatively long duration of sunshine already mentioned as shown by König's map to be characteristic of south-eastern Europe.

**Cultivated land.**

Dr. Brückner's remarkable treatise on the variations of climate in time. Though it deals with such variations over the entire land-surface of the globe, a large proportion of the data are derived from Europe, for which continent, accordingly, the temperature maps in the succeeding volume are more particularly drawn. The peculiar variations in temperature, rainfall, the date of the vintage, the frequency of cold winters, the level of rivers and lakes, the duration of the ice-free period of rivers (in this case all Russian), and other meteorological phenomena are of peculiar interest. They apply to 29 stations in France, south-west Germany and Switzerland, and for one station (Dijon) go back with few breaks to the year 1891; and as the variations of climate of the land-surface, according to his indication correspond precisely to the indication derived from temperature and rainfall in those periods in which we have corresponding data for these meteorological elements, they may be taken as warranting conclusions with regard to these points even for periods up to a century and a half, and, what is still more important, they correspond to one of comparatively scanty rains and high temperatures. It is accordingly interesting to note that the data referred to indicate, on the whole, for Dijon an earlier vintage for the average of the last century than for the period 1850-1880, and the periods of the same length from 1816-1840; but that the figures generally show a regular retardation from period to period, but more or less regular oscillations, differing in their higher and lower limits in different periods of long duration. Much the same state of things prevails in central Europe by the publication of Engelbrecht's *Landschriften der Cultivierten ansetzibaren Länder.* Of the two chief bread-plants, of Europe, wheat and rye, wheat is cultivated as far north as Jutland, while rye is restricted to the south-west, south, and more rye than wheat to the east and north, runs parallel to the west coast of the Netherlands and Belgium, then strikes south-eastwards as to include nearly all Germany except Alsace-Lorraine and the south-west of Württemberg, also eastern Switzerland, nearly all the Alpine provinces of Austria and nearly the whole region north of the Carpathians, as well as the greater part of Bohemia and Moravia, the area in which wheat predominates, while in Russia the limit runs east-north-east from about 44° N. in the west to about 55° N. in the Urals. On one side of this line wheat makes up more than 80% of the winter grain area in western Rumania, in Italy and a small part of the south of England. Oats are more cultivated than all varieties of wheat in Ireland, in the west and the northern half of Great Britain, in Finland and in the greater part of Denmark and Schleswig-Holstein. Barley is more largely cultivated in the south and western parts of the interior of the Maize is cultivated to a great extent in the north-west of the Iberian Peninsula, in the south-west of France and in northern Italy and in the lands bordering the lower Danube; in Belgium parts covering in area equal to or greater than that occupied by all grain crops. Millets (various species of panicum) are most extensively cultivated in the south-east of Europe. The kind of millet known as guinea-corn or durra (Sorghum vulgare Pers.), so extensively cultivated in Africa and India, is grown to a small extent on the east side and in the interior of Iria. Buckwheat is cultivated in the west and east of the continent—in the west from the Pyrenees to Jutland, in the east throughout southern and middle Russia. The cultivation of rice, not only in the Balkan Peninsula and in central Europe, but has made comparatively little progress in Russia. The cultivation of lentils is most largely pursued in the west and south-west of Germany and in the south and north of France. That of lupins has spread with great rapidity since 1845. The cultivation of sugar beet is not yet extended to Austria-Hungary, and the cultivation of industrial hemp is not yet considerable in south-eastern Germany, northern Bohemia and the south-west of Russia. Flax, like other industrial plants, shows a tendency to concentrate itself on specially favourable districts. The cultivation of tobacco is comparatively recent in the south-east of Europe, above all in Russia. Teasels are grown in various spots in the south-east of France and in southern Europe. The cultivation of madder is not yet extensive in Holland and Belgium, that of weld (Reseda L.) is confined to England and France. Tobacco cultivation even carried on in Sweden and Great Britain, but the most northerly area in which it occupies as much as 0.1% of the grain area is the Danish island of Fyen (Fynen).

The vine can be grown without protection in southern Scandinavia, and has been known to ripen its grapes in the open air at Christiansand in 63° 7'; but its cultivation is of no importance north of 47° on the Atlantic coast, 50° on the Rhine, and from 50° to 52° in Great Britain. It is grown on the west coast of Italy, on the east to 17° E. The olive, with its double crop, is one of the principal objects of cultivation in Italy, Spain and Greece, and is not without its importance in Portugal, Turkey and southern Austria. Tobacco cultivation is not yet extensive in France. The cultivation of tobacco even carried on in Sweden and Great Britain, but the most northerly area in which it occupies as much as 1% of the grain area is the Danish island of Fyen (Fynen).

The potato, which was introduced to Sweden in 1816, and which eventually spread to Austria-Hungary, Germany, France, Italy, and Spain. In Sardinia the acorn of the Quercus Ballota is still used as a food, and in Italy, France, Austria, and Russia the chestnut tree (Castanea sativa) is cultivated in the Mediterranean region the prevailing forms— which the Germans conveniently together in the expression Südfichte, or southern fruits—are the orange, the citrus, the almond, the pomegranate, the fig and the carob tree. The palm trees have a very pal pal range in the western Mediterranean region, the palm (Phoenix dactylifera) ripens only in southern Spain with careful culture; the dwarf palm (Chamaerops humilis) forms thickets along east coasts.
the Spanish coast and in Sicily, and appears less frequently in southern Italy and Greece.

Special interest attaches to the two main bread crops of Europe, wheat and rye; the average annual production of which in the different countries of the continent at three periods is shown in the following tables.

**Average Production of Wheat in Millions of Bushels.**

1872-1876.  1881-1890.  1894-1903.

Perhaps the most striking facts revealed by these two tables are these; first, that the United Kingdom is the only great wheat-growing country which has shown a great decline in the amount of production in two successive periods: and, second, that both Germany and Russia show a great advance under both wheat and rye between the last two periods. This gives interest to statistics of acreage under these two crops, and some data under that head are given in the adjoining tables.

1 Based on Scherzer, *Das wirtschaftliche Leben der Völker*, p. 12.
3 Based on the *Corn Trade Yearbook* (1904), p. 38.
4 Exclusive of Bosnia and Herzegovina, in which the average production in 1894-1903 was about 24 million bushels.
5 The estimates for Bulgaria, Rumania, Servia and Turkey in Europe for 1872-1876 are not comparable with those of the two later periods on account of the territorial changes since that date. Those for Bulgaria in the period 1881-1890 include Eastern Rumelia.
6 Including Poland.
7 Spanish statistics very imperfect.
8 Based on the same authorities as the wheat table. In the original, however, the figures for 1894-1903 are given in "quarters of 480 lb.," while the figures given above are calculated on an average quarter of 402 lb.
9 Including Poland, but not Finland, in which the average production of rye is estimated at about 11,000,000 bushels.
10 Mainly from or based on the Agricultural Returns for Great Britain, 1905.
11 Single years.
12 Period 1883-1887.

**Acreage under Rye.**

These figures show that the increased production is only in part, in some cases in small part, attributable to increase in area, and the following figures giving the average annual yield of wheat per acre (a) in the period preceding 1885, and (b) generally in the period of five years preceding 1895, shows that an improvement in yield in recent years has been very general.

When the Aryan peoples began their immigration into Europe a large part of the surface must have been covered with primeval forest; for even after long centuries of human occupation the Roman conquerors found vast regions where the axe had made no lasting impression. The account given by Julius Caesar of the Silva Hercynia is well known: it extended, he tells us, from sixty days' journey from Helvetia westward, and it probably included what are now called the Schwarzwald, the Odenwald, the Spessart, the Rhön, the Thüringerwald, the Harz, the Fichtelgebirge, the Erzgebirge and the Riesengebirge. Since then the progress of population has subjected many thousands of square miles to the plough, and in some parts of the continent it is only where the ground is too sterile or too steep that the trees have been allowed to retain possession. Several countries, where the destruction has been most reckless, have been obliged to take systematic measures to control the exploitation and secure the replantation of wasted areas. To this they have been constrained not only by lack of timber and fuel, but also by the prejudicial effects exerted on the climate and the irrigation of the country by the denudation of the high grounds.

But even on the whole, Europe is well wooded, and no or three countries find an extensive source of wealth in the export of timber and other forest productions, such as turpentine, tar, charcoal, bark, bast and potash.

Horse-breeding is a highly important industry in almost all European countries, and in several, as Russia, France, Hungary and Spain, the state gives it exceptional support. Almost every district of the continent has a breed of its own: Domestic animals. Russia reaps those of the Bashkirs, the Kal'mucks, the Don-Cossacks, the Esthonian and the Finlanders as among its best. France sets store by those of Flanders, Picardy, Normandy, Limousin.

**The following estimates of the forest areas of European countries are given in G. S. Bouger's "Wood."**

</table>
and Auvergne; Germany by those of Hanover, Oldenburg and Mecklenburg, which indeed rank among the most powerful in the world; and Great Britain by those of Suffolk and Clydesdale. The English races are famous throughout the world, and Iceland and the United Kingdom is much more marked. The production reached a maximum in 1882 (18,020,000 tons), and since then it has sunk in one year (1933) as low as 11,200,000 tons, while, on the other hand, there was a rapid increase in the production of iron ores in the Gneisenau (including Luxembourg), France, Spain, Sweden and Russia, down to 1900, with a more progressive movement, in spite of fluctuations, in all these countries than in the United Kingdom in more recent years. In the total amount of production in the United Kingdom in 1905 exceeded that of the United Kingdom by nearly 600,000 tons.

An indication of the relative importance of different European countries in the production of ores and metals of less aggregate value than coal and iron is given in the following tables 1:

- | Gold | Silver | Quicksilver Ore | Tin Ore |
- | Austria | 126 | 38,940 | 91,494 |
- | German Empire | 3,738 | 52,383 | 126,589 |
- | United Kingdom | 58 | 4,614 | 7,786 |

Kilos = kilograms. M.t. = metric tons.

Copper Ore | Lead Ore | Manganese Ore | Zinc Ore |
- | Austria | 20,355 | 19,683 | 13,492 | 32,037 |
- | Germany | 765 | 7,651 |
- | United Kingdom | 1,338 | 1,085 |
- | Spain | 32,203 |
- | United Kingdom | 7,598 | 31,299 |

M.t. = metric tons.

Platinum has hitherto been obtained nowhere in Europe except in the auriferous sands in the Russian government of Perm. Nickel is derived from Germany, Norway and Sweden; antimony from Germany and Hungary, bismuth from Saxony and Bohemia. Bauxite, which is used in the manufacture of aluminium, is obtained from France, Styria and Ireland. In order of importance the chief salt-producing countries are the United Kingdom (in which for some years the output has been for the most part stationary or even declining), Germany (which is rapidly increasing its production), Russia, France, Spain, Italy, Austria-Hungary, Rumania and Switzerland. Besides common salt Germany has for many years been producing a rapidly increasing amount of potash salts, of which it has almost a monopoly. Its position is thus the United Kingdom by 1905.

- 2 Production in the United Kingdom, 1905.
- 3 Production in the United Kingdom, 1906.
- 4 A considerable quantity of quicksilver is produced in the government of Ekaterinoslav.
- 5 Copper pyrites and cuprous iron pyrites, besides which a considerable quantity of copper precipitate is produced.
- 6 A small quantity of copper ore is produced in Ireland, but the bulk of the annual production is in the Asiatic provinces.
- 7 Mainly cuprous iron pyrites and argyrodite.
- 8 In 1906 Greece produced 12,308 m.t. of argentiferous lead.
- 9 Of which 158,424 m.t. argentiferous.
- 10 A considerable quantity of manganese ore is produced in the government of Ekaterinoslav, but the main seat of Russian production is the Caucasus.
- 11 Zinc and lead ore.
- 12 In addition to 28,891 m.t. of calcined zinc ore.
important producer of sulphur. Among other mineral products, 
may be mentioned the borax and alluvial marl of Tuscany, 
the statuary marble of Greece, the glass of Switzerland, 
Italy, Germany and Austria-Hungary, the slate of Wales, Scotland 
and the Lake District, the iron of Germany, England and 
France, and the amber and glass sands of Belgium, France and Bohemia.

With regard to commerce, industries and railways, as a whole, 
Europe is said to be characterized by the rapid development 
of manufacturing at the expense of agricultural production. 
With few exceptions the countries of Europe that export 
agricultural products are able to spare a diminishing 
proportion of the aggregate of such produce for export. 
Other countries are becoming industrialized and are 
importing agricultural products. Most European countries, 
even if not able to export a large proportion of manufactured articles, 
are at least securing a greater and more complete command of the home 
market for such products. In this way and by manufacturing 
industries are extending the range of their markets. All these changes 
have been largely, if not chiefly, promoted by the improvements 
in the means of communication, and the means of transport by land 
and sea. Larger ships more economically propelled have brought 
grain at a cheaper and cheaper rate from all parts of the world, and 
improved methods of refrigeration have made fresh meat, butter and 
other perishable commodities even from the southern hemisphere 
articles of rapidly growing importance in European markets.

The improvements in transport have likewise tended to bring British coal 
in many parts of the mainland of Europe. On the other hand, the 
extension of the railway network of the continent has brought a 
wide area within the domain of novel mining regions connected 
with the coalfields occurring at intervals in central Europe from 
the upper Oder to the basin of the Rhine, as well as some of the more 
detached coalfields of Russia. As affecting the relative advantages 
of different European countries for carrying on manufacturing 
industry, the invention of the steam engine and the improvements 
that have followed on recent years may be mentioned as of capital importance: (1) the invention in 1879 of 
the Thomas process for the manufacture of cast iron and steel 
from the phosphoric iron ores, an invention which gave greatly 
increased value to the ores on the borders of Lorraine, Luxembourg 
and Alsace, as well as others both in England and on the continent; 
(2) the invention of efficient machines for the application of power 
by means of electricity, an invention which gave greatly increased 
progress in the water-power of modern countries; and (3) the discovery of the fact that 
from lignite an even higher grade of producer gas may be obtained than from coal, a discovery 
which was of special importance for the great lignite-producing districts 
of Germany, Poland, and Belgium.

Such particulars as can be procured with regard to the utilization 
of water-power in the countries of Europe which use that 
source of power most largely are given in the following table:

<table>
<thead>
<tr>

The figures derived from the three recent industrial censuses of 
Switzerland are very instructive, especially if one is justified in 
including the electric current among the hydraulic installations. The 
estimates that have been made of the total available water-power in a

1 Probably the most complete synopsis of the evidence on this point is to be found in Prince Kropotkin's *The People and Its Industry*, edited by C. Sundberg (Stockholm, 1894).

2 The total horse-power used in mechanical industries is obtained by adding 65,000,000 to the estimated total horse-power in hydraulic installations given in an article in the *Annales de géographie* for January 1904, to the total steam-power in fixed engines, official for 1903, and accordingly excludes gas and other engines not driven by steam or water-power.

3 The proportion estimated in the official publication entitled *The People and Its Industry*, edited by C. Sundberg (Stockholm, 1894).

4 Including the establishments returned in the Swiss industrial censuses as electric, most if not all of which are probably driven by water-power.

437

few European countries are mostly based on such problematical data that they are not worth giving. One very uncertain element in 
such calculations is the amount of water-power that is capable of 
being artificially created by the construction of valley-dams, such 
as the Rhine, and the artificial mining and mining regions of Germany from an early date, and now 
being built on a much larger scale in the Rhine region and other parts 
of Europe, or is incidentally provided in the construction of canals.

Before the outbreak of the war a report of the government of Great Britain had been prepared which 
the earliest times the influence of the outline and physical features in determining 
great trade-routes along certain lines. At all periods 
land routes have connected the southern seas with the 
Baltic and the North Sea, effecting the great saving of 
distance more or less indicated by the following table:

</table>

From the form of the continent it obviously results that the farther 
east the route lies the greater is the saving of distance. The precise 
direction of the routes has been very largely determined by the 
physical features; by the course of the rivers where navigable 
formed parts of the routes; in other cases by the form of the mountains, 
or the direction of the river valleys which is the form of the mountains.

Another route, on the other hand, is a great northern route through 
Vienna, and then north-eastwards through the opening 
that separates the Carpathians and the Sudetic range to the head-waters of the Oder, 
crossing a water-parting (Vistula) with the rivers of the Sudetic 
which was certainly used in ancient times. Another route 
starts from Olbia near the mouth of the Bug, 
the objective point being the coast in the south-east 
and the Baltic supplying the amber, which was so 
important an article of commerce in early times. This route 
was again much used in the middle ages, when Visby, on 
Gotland, undoubtedly selected on account of the 
security afforded by an island station, was hundreds of years 
and the continuity of a great part of which 
and the continent, Arabia, found not merely in Gotland itself but also at various 
points along the route indicated, testify to the long-continued 
importance of this route. In the middle ages the Oder route 
was also largely used where it reached the Rhine near the Rhine 
or the Danube, and in connexion with that route the island 
the Baltic long formed a focus of commerce, answering to that in 
Gottland farther east. The Danube route was also made use of farther 
point north of the Vistula and on the Baltic, and on the 
and from that point north of the Vosges to the Marne and Seine.

Farther west use was made at an early date of passages by which 
the whole system of the Alps could be crossed, or partly crossed 
and partly rounded, in a single rise. The ancient Engarians, in exchanging 
their earthenware and bronzes for the amber found largely in those
EUROPE at the end of the 10th Century

Kingdom of Germany

English Miles

East Roman Empire (c.1190)
times not only in the Baltic but also on the eastern shores of the North Sea north of the Rhine mouths, made regular use of at least three such passes. One of these was the Brenner, the summit of which is 1,450 ft. in height, approached on the south side by the railway and on the north side by the Inn valley and that of its small tributary the Sill. By this route the Alps at about their widest are crossed with exceptional ease; and hence it was natural that it should have been used by the Etruscan highway builders. The Brenner passes for the most part between Mont Blanc, and so to the Isere valley and the Rhone, and to the Great St Bernard, to the east of Mont Blanc, and so directly to the Rhone valley above the Lake of Geneva, by which route the remainder of the Rhone valley was reached by crossing the northern Jura. Roman roads were afterwards made across all these passes, although that across the Great St Bernard (the highest of all, above 8,000 ft.) seems never to have been made practicable for carriages. The Brenner is the only pass made use of as three intercontinental passes by which in a single rise from the Po basin the heads of valleys leading right down to the head of Lake Constance could be reached. These were the Bernardo, Spiglion and Septimer, to mention them in the order from west to east. By the Romans the Simpson and other routes of the Brenner valley were opened. The roads between Milan and the upper Rhone valley. All these passes were likewise in use in the middle ages when Venice and Genoa were the great intermediaries in the trade in pepper and spices and other Oriental commodities. The Brenner routes were opened to northern Germany by a route leading also to northern Italy by way of Ratisbon and afterwards the rivers of the Elbe basin, and finally (from the end of the 14th century) by a canal from the Alpine valleys to the Rhine. The Brenner was the chief of these, and other products for the Baltic. To take the most direct route to the Rhine valley and westward Europe some other pass (the Seefeld or the Fern) in the Bavarian Alps had to be crossed and the Brenner routes were opened, and thence either by way of Ulm or Frankfurt. From Genoa the routes in the early middle ages were by way of Milan to the Lake of Constance, and thence by way of Ulm if the Rhine valley was the goal, and by way of Augsburg if it was the Rhone valley. In the 14th century it is possible that some routes were opened between the Rhone valley and the eastern entrance by the Saône and other valleys of Burgundy, as the ancient Roman roads are known to have been in existence in the 15th century. The Mont Cenis pass was from an early date afforded the most direct connexion between Genoa and the middle Rhone valley by way of Turin and Lyons, but the modern tunnel to be built at this pass was still the same route that were chosen. The road across the Brenner, completed in 1772, was the first of these. The building of the great Swiss carriage roads across the passes in the early part of the 19th century was inaugurated by Napoleon's road across the Simplon completed in 1805. A later paragraph will show that modern railways follow much the same, if not exactly the same, routes. On the early use of the Saône-Rhone valleys, and the route between the foot-hills of the Pyrenees, and even the corridor through the Brenner is known, but it may be mentioned that English tin was sometimes conveyed to Marseilles (Marseilles) by this latter route in Roman times.

Since the introduction of railways inland waterways have in most countries taken the place of roads as means of transport, and the articles on the different countries supply the necessary information with respect to those which have a purely national importance. The table given below refers only to such as belong to our trans-European routes or have an international value. The importance of shortening the railway route between the opposite shores of the great European isthmus separating the Baltic and the Black Sea is brought into prominence by the constant revival of projects for a ship- canal connecting the two coasts. The main objection to such a project is that of a scheme for the excavation of a canal about 28 ft. deep between Riga and Kher son, utilizing the waters of the Duna or Donau and Dniester, is based on the efficiency of the navigation of the Black Sea. Since the completion in 1845 of the Ludwigsburg-Danube-Main Canal, running from the Main near Bamberg to Kelheim on the Danube, it has been possible to carry by water from the mouth of the Rhine to the mouth of the Danube; but this canal has in reality no trans-European significance. It can take barges of a greater capacity than 125 tons, is not adapted for steamers, and carries only a very small amount of traffic. But projects for connecting the Danube with northern Europe by water are still entertained. Of these the most advanced are those for establishing connections through Austria. On the 11th of June 1901 the Austrian diet passed an act prescribing the construction of a canal connecting the Oder with the Danube through the Austrian part of the Oder-Moldau-Elbe, and the improvement of the navigation on the connected waterways. The Oder-Danube canal thus authorized would have to cross a watershed of little more than 1,000 ft. In altitude as against 6,264 ft. in the case of the Grand Canal. It would be of a greatly important international waterway, inasmuch as it allows of steamer traffic from Prague in Bohemia to Hamburg, and by means of a connecting canal to Lübeck. But the most important of all international waterways in Europe is the Rhine, on which even seagoing steamers regularly ascend to Cologne, and even steam traffic crosses the Dutch frontier three or four times as great as that which makes use of the Manchester ship-canal.  

The river is also navigable to Basel in Switzerland, though above Strassburg the river is little used, being replaced by the navigable Rhine canals, and the Rhine is connected with the rivers of the Ill and the Saône. The Rhine is also connected with the Seine by the Marne and Rhine canal passing north of the Vosges, and its tributary the Moselle is also navigable from France through Belgium to the North Sea. The Moselle is navigable from the Mosel to the Rhine, and the Mosel to the Saône. The Rhine is navigable from the Mosel to the Seine, and the Seine to the Moselle. The Moselle is navigable from the Seine to the Moselle, and the Seine to the Moselle.

The importance of international navigation is shown by the fact that the Rhine has been opened for navigation up to Basel, and navigable up to Cologne and the Black Sea. The Rhine is navigable from the Moselle to the Seine, and the Seine to the Moselle. The Rhine is navigable from the Moselle to the Seine, and the Seine to the Moselle. The Rhine is navigable from the Moselle to the Seine, and the Seine to the Moselle. The Rhine is navigable from the Moselle to the Seine, and the Seine to the Moselle.
The chief railways of most European countries are on the same gauge as that originally adopted in Great Britain, namely, 4 ft. 8½ in. Irish railways are, however, on the gauge of 5 ft. 3 in. The standard gauge in Russia is 5 ft., that of Spain and Portugal about 5 ft. 3½ in., and that of France and Germany 4 ft. 8½ in. The former is the gauge universally adopted in eastern Europe and the latter in western Europe.

The very general use of a common gauge obviously greatly facilitates international trade. It allows, for example, of wagons from Germany entering every country on its frontier except Russia. It also affords an easy transit for the carriage of goods between Paris, Milan, and the mainland of Denmark. By means of trains German trains can also be conveyed to Copenhagen by way of Warnemünde and Gjøtzer and then across the channel separating Faïster and Zealand; and there is a tunnel beneath the strait connecting with the Berthelns. In the Baltic the line was extended to Observatory in 1856. In 1896 a railway was opened between the upper Rhone valley and the Tréon valley, shortening the route between Milan and northern France, effects the crossing at an altitude of only 2300 ft., nearly 4300 ft. lower than the pass, but by 1880 only 212 m. Steps were subsequently taken to continue the Simplon route northwards by a tunnel through the Lötschberg in the Bernese Alps, and a project is entertained for continuing the Vintchgau (upper Adige) railway across or under the Reichenbach to the Inn valley. An important east-west connection was opened across the Rhine in 1937, linking the valley of the Rhine above the Lake of Constance opened in 1884.

Several lines wind through and cross the Jura. That which in the Massif of the Vosges established an important international importance on the opening of the St Gotthard tunnel, inasmuch as it lies on the route thence to the Rhine valley at Basel; and that which crosses the Col de Jougue and continues to Geneva was opened in 1911. Another is the completion of the Simplon tunnel. Further projects are entertained for shortening the connection between this tunnel and the north of France by making a more direct line from Villorbe to the French side of the Rhine. The route already existing by the Lake of Constance and through the Brenner tunnel followed this path in 1838. The other of these, more of a railway barrier than the mightier system of the Alps, but in 1904 a convention was concluded between the French and Spanish governments providing for the establishment of railway connection between the two countries at three points of the great chain.

There are several railways across the Carpathians, mostly by passes under 2000 ft. in height. The fact that the Tomos Pass, on the line from Bucharest to Târgoviste, affords an altitude of 3370 ft. was undoubtedly one reason why this railway following this route, completed in December 1879, passing through several tunnels, was one of the last to be constructed. But the obstructions of this mountainous mass has not been the only cause of delay in the building of railways. Spanish economic backwardness have also proved hindrances, especially in Russia and the Balkan Peninsula. The railways to Constantinople and Salonica were completed only in 1888, and yet the highest altitude on the Constantinople line is only 300 ft. The Rhine was also opened in 1900. Among other important railways of recent date and of more than merely national significance may be mentioned that bringing Bucharest into connexion with the Black Sea port of Constantza by the route of the wilderness of Dobrudja (opened in September 1895); a line across the Carpathians connecting Debrecen with Lemberg, the continuation of the line eastwards from Lemberg to Kiev; a network bringing the coalfield of the Donets basin into connexion with the sea via the Odesa-Harbin route (opened in 1896); and a railway connecting Novorossisk with Vladivostock, and branches from the point connecting that line with Norovossiisk on the Black Sea on the one hand, and with Tarssyt on the last. The railways of all these lines will be very greatly to the advantage of the bringing Archangel into connexion with the European system at Vologda (opened in 1898); a detached line in the north-east across the Urals from Perm to Ekaterinburg (completed in 1879) to which Portovoz, which has a branch running northwards to Ekaterinburg, and this line now affords uninterrupted communication with the northern Ova, inasmuch as the railway which originally started at Perm has been continued to the Finnish border, and the line which has a branch at the point of origin of that river, to which point it was opened in 1900; and a line in the east connecting the European system at Samara with the great mining centre at Zlatoust, already in 1890 complete and in use in 1895, and since then carried farther east as the great Siberian railway.

The result of the construction of the numerous transcontinental railways has been to bring rail and sea-routes and ports on opposite sides of the continent into competition with one another to a greater degree than is possible in any other case, and the competition of these has brought about a considerable development of the industries, and above all perishable commodities may be sent right across the continent even through the mountains. Even from Great Britain, which is bound to carry its external commerce in part by sea, the railways of the north will be much more important than until the railways of the northern part of the country. But it will be the railways from one or other of the North Sea ports. It will hence be readily understood that for inland trade on the mainland the competition between ports on opposite sides of the continent and between the inland centres to which that competition extends. This competition is inevitably all the more keen now that the trade of Europe with
the East is more often through the Mediterranean as it was in ancient times and the Middle ages. The great shortening of the sea-route in this trade at such ports as Marseilles, Triest, Venice and Genoa, indicated by the figures below, goes far to counterbalance the extra cost even of railway transport across the mountains.

An enormous amount of investigation with regard to European ethnology has been carried on in recent years. These labours have chiefly consisted in the study of the physical type of different countries or districts, but it is not necessary to consider in detail the results arrived at. It should, however, be pointed out that the idea of an Aryan race may be regarded as definitely abandoned. One cannot even speak with assurance of the diffusion of an Aryan civilization. It is at least not certain that the civilization that was spread by the migration of peoples speaking Aryan tongues originated amongst and remained for a time peculiar to such peoples. The utmost that can be said is that the Aryan languages must in their earliest forms have spread from some geographical centre. That centre, however, is no longer sought for in Asia, but in some part of Europe, so that we can no longer speak of any detachment of Aryan-speaking peoples entering Europe.

The most important work, summarizing the labours of a host of specialists on the races of Europe, are those of Ripley and Deniker. Founding upon a great multitude of data that have been collected with regard to the form of the head, face and nose, height, and colour of the hair and eyes, most of the leading anthropologists seem to have come to the conclusion that there are three great racial types variously and intricately intermingled in Europe. As described and named by Ripley, these are: (a) the Teutonic, characterized by long head and face and narrow aquiline nose, high stature, very light hair and blue eyes; (b) the Alpine, characterized by round head, broad face, variable rather broad heavy nose, medium height and "stocky" frame, light chestnut hair and hazel grey eyes; and (c) the Mediterra-anean, characterized by long head and face, rather broad nose, medium stature and slender build, dark brown or black hair and dark eyes. The Teutonic race is entirely confined to north-western Europe, and embraces some groups speaking Celtic languages. It is believed by Ripley to have been differentiated in this continent, and to have originally been one with the other long-headed race, sometimes known as the Iberian, and to the Italians as the Ligurian race, which "prevails everywhere south of the Pyrenees, along the southern coast of France, and in southern Italy, including Sicily and Sardinia," and which extends beyond the confines of Europe into Africa. The Alpine race is geographically intermediate between these two, having its centre in the Alps, while in western Europe it is spread most widely over the more elevated regions, and in eastern Europe "becomes less pure in proportion as we go east from the Carpathians across the great plains of European Russia." This last race, which is most persistently characterized by the shape of the head, is regarded by Ripley as an intrusive Asiatic element which once advanced as a wedge amongst the earlier long-headed population as far as Brittany, where it still survives in relative purity, and even into Great Britain, though not Ireland, but afterwards retired and contracted its area before an advance of the long-headed races. Deniker, basing his classification on essentially the same data as Ripley and others, while agreeing with them almost entirely with regard to the distribution of the three main traits (cephalic index, colour of hair and eyes, and stature) on which anthropologists rely, yet proceeds further in the subdivision of the races of Europe. He recognizes six principal and four secondary races. The six principal races are the Nordic (answering approximately to the Teutonic of Ripley), the Iberian or Atlantic-Mediterranean, the Ibero-Insular, the Oriental, the Adriatic or Dinaric and the Occidental or Cevenol.

1 See bibliography at the end of the article.

Although language is no test of race, it is the best evidence for present or past community of social or political life; and nothing is better fitted to give a true impression of the position and relative importance of the peoples of Europe than a survey of their linguistic differences and affinities. The following table contains the names of the various languages which are still spoken on the continent, as well as of those which, though now extinct, can be clearly traced in other forms. Two asterisks are employed to mark those which are emphatically dead languages, while one indicates those which have a kind of artificial life in ecclesiastical or literary usage.

From this conspectus it appears that there are still about 60 distinct languages spoken in Europe, without including Latin, Greek, Old Slavonic and Hebrew, which are still used in literature

2 See on the whole subject Hovelacque's *Science of Language*, Latham's *Nationalities of Europe*, and the same author's *Philology*.
or ecclesiastical liturgies. Besides all those which are spoken over extensive territories, and some even which are confined within very narrow limits, are broken up into several distinct dialects.

The boundaries of European countries have of course been determined by history and in some cases only historical events can be held to account for their general situation, the influence of geographical conditions being seen only on a minute examination of details. In most cases, however, it is otherwise. The present political boundaries were all settled when the general distribution of population in the continent was in a large measure determined by the geographical conditions, and accordingly the lines along which they run for the most part show the influence of such conditions very clearly, and thus present in many cases a marked contrast to the political boundaries in America and Australia, where the boundaries have only been marked out in advance of the population. In Europe the general rule is that the boundaries tend to run through some thinly peopled strip or tract of country, such as is formed by mountain ranges, elevated tablelands too bleak for cultivation, relatively high ground of no great altitude where soil and climate are less favourable to cultivation than the lower land on either side, or low ground occupied by heaths or marshes or some other sterile soil; but it is the exception for important navigable rivers to form boundaries between countries or even between important administrative divisions, and for such exceptions a special examination can generally be found. Navigable rivers unite rather than separate, for the obvious reason that they generally flow through populous valleys, and the vessels that pass up and down can touch as easily on one side as the other. Minor rivers, on the other hand, flowing through sparsely peopled valleys frequently form portions of political boundaries simply because they are convenient lines of demarcation. A brief examination of the present political map of Europe will serve to illustrate these rules.

The eastern frontier of the Netherlands begins by running southwards through a marsh nearly parallel to the Elbe but nowhere touching it. Then winds south or south-westwards through a rather sparsely peopled district to the Rhine. This river it crosses. It then approaches but does not touch the Meuse, but runs for a considerable distance roughly with the Meuse, to the higher ground, where the population is much more scanty than in the valley. On the side of Belgium the Dutch boundary is for the most part thoroughly typical, winding along the frontier parties of the Dutch or Belgian provinces of North Brabant, Limburg and Antwerp. The Scheldt nowhere forms a boundary between countries, not even at its widest estuary. The eastern frontier of art of the valley is typical both on the side of Germany and Luxembourg. It is otherwise, however, on the south, there that country confines with France, and indeed the whole of the north-east frontier of France may be called a historical frontier, showing the influence of geographical conditions only in details. One of these details, however, deserves attention, the tongue in which it adds a considerable breadth to Belgium, so as to give to France the natural fortress of Givet, a tongue, as it were, the outline of which is as typical a boundary as it is to be seen in Europe in respect of scantiness of population.

The mountainous frontiers of France on the east and south require hardly any comment. Only in the Burgundy Gate between the Vosges and the Jura is an artificial boundary of any account; and even then in a minor degree illustrates the general rule. The division of the Iberian peninsula between Spain and Portugal goes back in effect to the time of the Moors starting from the north side of the Douro resulted in the formation of the kingdom of Portugal, which found its natural eastern limit on the sparsely peopled margin of the Iberian tableland, where the rivers cease to be navigable and flow through narrow gorges, that of the Tagus, where the river marks the frontier, being almost without inhabitants, especially on the Spanish side.

The greater part of the Italian boundary is very clearly marked geographically, though we have to look back to the weakness of divided Italy to account for the instances in which northern mountains have pushed their way into southern Alpine valleys. Even in these parts, however, there are interesting illustrations of geographical influence in the way in which the Italian boundary crosses the northern ends of the Lake Maggiore and the Lake of Garda, and cuts off portions of Lake Lugano both in the east and west. In all these cases the frontier crosses from one steep unpeopled slope to another, assigning the population at different ends or on different sides of the lakes to that which belongs the adjacent population not lying on their shores.

Of the Swiss frontiers all that it is necessary to remark is that the river Rhine in more than one place marks the boundary, in one, however, where it traverses alluvial flats liable to inundation (on the side of Austria), in the other place where it rushes through a gorge. The Alps along the southern frontier of Germany are almost throughout typical, the northern is the sea, except where a really artificial boundary runs through Jutland.

In the east of Germany and the north-east of Austria the winding frontier through low plains is the result of the partition of Poland, but in spite of the absence of marked physical features it is for the most part in its details almost as typical as the mountainous frontier on the south of Germany. All the great rivers are crossed. Most of the line runs through sparsely peopled districts, and the natural population in one part of it, where upper Silesia confines with Russian Poland, has been developed since the boundary was fixed.

In the Balkan Peninsula the most striking facts are that the Balkans do not, and the Danube to a large extent does form a boundary. Geographical features, however, bring it with the dividing ridge of the Maritsa (eastern Rumelia) into intimate relation with upper Bulgaria, the connexion of which with Bulgaria north of the Balkans had long been established by the valley of the Isker, narrow as that valley is. On the side of Russia, again, it is the marshes on the left bank of the Danube even more than the river itself that make of that river a frontier. An examination of the eastern boundary of all that is included in Russia in Europe will furnish further illustrations of the general rule.

Finally, on the north-west of Russia it was only natural that the Tsars and the Tana should be taken as lines of demarcation in that thinly peopled region, and it was equally natural that where the

EUROPE [HISTORY]

2. POLITICAL HISTORY

The origin of the name of Europe has been dealt with above, and the difficulty of any exact definition of the geographical limits covered by this term has been pointed out. A similar difficulty meets us when we come to deal with European civilization. We know what we mean when we speak of European civilization, though in its origins, as in its modern developments, this was not confined to Europe. In one sense the history of Europe is the history of this civilization and of the forces by which it was produced, preserved and developed; for a separate history of Europe could never have been written but for the alien powers by which this civilization was for centuries confined within the geographical limits of the European continent. Moreover, within these geographical limits the tradition of the Roman empire, and above all the organization of the Catholic Church, gave to the European nations, and the states based upon them, a homogeneity which without them could not have survived. The name of Europe, indeed, is the medium through which modern times, no matter how "geographical expression"; its diplomatic use, in the sense of a group of states having common interests and duties, is, indeed, no older than the 19th century; in the middle ages its place was taken by the conceptions of the Church and the Empire, which, though theoretically universal, were practically European. Yet the history of the states system of Europe, though enormously influenced by outside forces, possesses from the first a character of its own, which enables it to be treated as a separate unit. This historical Europe, however, has never been exactly commensurate with Europe considered as a geographical division. Russia, though part of Europe geographically—even if we set the limits of Asia at the Don with certain old geographers—had but slight influence on European history until the time of Peter the Great. The Ottoman empire, though its influence on the affairs of Europe was from the first profound, was essentially an Asiatic power, and was not formally introduced into the European system until the treaty of Paris of 1856. It still remains outside European civilization.

Europe, then, as we now conceive it in its application to the political system and the type of culture established in this part of the world, may, broadly speaking, be traced to four principal origins: (1) the Aegean civilization (Hellenic and pre-Hellenic); (2) the Roman empire; (3) Christianity; (4) the break-up of the Roman empire by the Teutonic invasions. All these forces helped in the development of Europe as we now know it. To the Aegaean civilization, whether transformed by contact with Rome, and again transformed by the influence of Christianty and the religious genius of the middle ages, or recently discovered during the classical Renaissance—Europe owes its characteristic qualities of its thought and of its expression in its art and literature. From republican Rome it largely draws its conceptions of law and of administrative order. From the Roman empire it inherited a tradition of political unity which survived, in visible form, though but as a shadowy symbol, until the last Holy Roman emperor abdicated in 1806; survived also, much more strongly, in the rule of the Roman lawyers which developed into modern international law. Yet more does Europe owe to Christianity, an Asiatic religion, but modified by contact with Greek thought and powerfully organized on the lines of the Roman administrative system. The Roman Church remained a reality when the Roman empire had become little more than a name, and was throughout the period of chaos and transformation that followed the collapse of the Roman empire the most powerful instrument for giving to the heterogeneous races of Europe a common culture and a certain sense of common interests.

The history of Europe, then, might well begin with the origins of Greece and Rome, and trace the rise of the Roman empire and the successive influence upon it of Hellenism and Christianity. These subjects are, however, very fully dealt with elsewhere (see ASIAN CIVILIZATIONS; GREECE: ROMAN CIVILIZATION HISTORY); and, as a result, therefore, be more convenient to begin with the Teutonic invasions and the break-up of the Roman empire, events which mark the definite beginning of the modern European states system.

In a sense the Roman empire had been already "barbarized" before the invasions of the barbarians en masse. Land left vacant by the dwindling of the population was colonized by immigrants, Teutonic and other, from beyond the frontiers; the Roman legions were largely recruited from Germans and other non-Romans, some of whom even rose to the imperial purple. Thus, in the end, the Roman emperor, with his guard and his household, ruling over an empire mercilesly exploited to fill his treasury, was essentially indistinguishable from those barbarian chiefs, with their austrotions and their primitive fiscal methods, who entered into portions of his inheritance and carried on the traditions of his rule.

The history of the Teutonic peoples prior to their organized invasions of the empire is dealt with elsewhere (see TEUTONIC PEOPLES). It was in the 4th century that the pressure of their advance was first felt on the frontiers, and this led to a change in the government of the empire which was to have notable consequences. In A.D. 395 Constantine had transferred the capital from Rome to Byzantium (Constantinople), but the empire, from the forth to the Tigris, continued to be administered successfully from a single centre. Not, however, for long: the increasing perils from without made a closer supervision essential, and after the death of Theodosius I. (395) the empire was divided
between emperors of the East and West. It was the beginning not only of the break-up of the empire, but of that increasing divergence between the eastern and western types of European religion and culture which has continued to this day.

The pressure of the Teutonic invasions became increasingly strong during the reigns of the emperor Valens and his successors. These invasions were of two types, (1) migrations of whole peoples with their old German patriarchal organization complete, (2) bands, larger or smaller, of emigrants in search of land to settle on, without tribal cohesion, but organized under the leadership of military chiefs. The earlier invaders, Goths and Vandals, and later the Burgundians and Lombards were of the first type; to the second belonged the Franks, "free" men from the Saxon plain, and the Saxon invaders of Britain. The distinction was a vital one; for the Goths, Vandals, Burgundians and Lombards never took root in the soil, and succumbed in turn, while the Frankish and Saxon immigrants, each man lord in his own estate, not only maintained themselves, but set up at the cost of the Roman organization and of the power of their own kings a wholly new polity, based on the independence of the territorial unit, which later on was to develop into feudalism.

It was owing to the pressure of Teutonic invaders from the East that the Teutonic peoples were first forced to take refuge within the empire. In 378 the Goths defeated and slew the emperor Valens in a battle near Adrianople; in 410 Alaric, king of the West Goths, sacked Rome; and shortly after his death the Goths passed into Gaul and Spain. In 445 Gaiseric, king of the Vandals, at the invitation, it is said, of the governor Bonifacius, passed over from Spain to Roman Africa, which became the centre of another Teutonic kingdom, soon established as a great naval power which for a while commanded the Mediterranean and devastated the coasts of Italy and Sicily with its pirates.

Meanwhile the Franks and Burgundians were pressing into Germany and Gaul, while from 449 onwards the Saxons, the Angles and the Jutes invaded and occupied Britain. For a moment it was doubtful if the Aryan or Teutonic races would be supreme, but in 491 Attila, king of the Huns, was decisively beaten in the battle of Châlons by a combination of Franks, Goths and Romans, under the Roman general Aetius and Theodosius, king of the Goths. This battle decided that Europe was to be Christian and independent of Asia and Africa. In 476 the succession of Western emperors came to an end with Odoacer's occupation of Rome, and with the decision of the Roman senate that one emperor was enough, and that the Eastern emperor, Zeno, should rule the whole empire. For a time Theodoric, king of the East Goths, ruled Italy, Gaul and Spain; but after his death in 526 the empire of the East Goths was shattered, and changes took place which led to the rise of independent Teutonic kingdoms in Gaul and Spain. In Gaul Clovis (d. 511), the king of the Franks, had already established his power, and in Spain, the West Gothic kingdom, with its capital at Toledo, now asserted its Teutonic independence. Under the emperor Justinian (527-565), indeed, the Roman empire seemed in a fair way to recover its supremacy; the Vandal kingdom in Africa was destroyed; in 555 the Byzantine general Narses finally shattered the power of the East Goths in Italy, and the exarchate of Ravenna was established in dependence on the Eastern emperor; the West Goths were forced to give up the south of Spain; and the Persians were checked. But with the death of Justinian troubles began. In 568 the Lombards, under Alboin, appeared in Italy, which they overran as far south as the Tiber, establishing their kingdom on the ruins of the exarchate. Though in Asia the emperor Heraclius, in a series of victorious campaigns, broke the Persian power and succeeded even in extending the Roman dominion, Italy, save for a while Ravenna itself and a few scattered sea-coast towns, was thenceforth lost to the empire of which in theory it still formed a part.

This catastrophe produced one result the importance of which it is impossible to exaggerate; the development of the political power of the papacy. At the beginning of the 6th century Rome, under Theodoric the Goth, was still the city of the Caesars, the tradition of its ancient life was yet unbroken; at the end of the century Rome, under Pope Gregory the Great (590-604), had become the city of the popes. And with the city the pope entered into some of the inheritance of the Caesars; in the world-wide activity of Gregory we already have a foreshadowing of universal claims, often effectively asserted, which made the great medieval popes, in a truer sense than the medieval emperors, the representatives of the idea of Roman imperial unity (see Rome, sec. ii. Middle Ages; PAPACY).
The next event that profoundly affected the history of Europe was the rise of Mahomedanism. In 612, after Gregory's death, occurred the flight (Furya) of Mahomet from Mecca to Medina, which fixed the memorable era of the Hegira. The full force of the militant religion founded by the Arab prophet was not felt till after his death (632). The emperor Heraclius, the vigour of his manhood passed, was unable to meet this new peril; the Arabs, strong in their hardy simplicity and new-born religious fanaticism, and aided by the treachery and cowardice of the decadent Roman-governing classes, overran Asia Minor, conquered Egypt, and the whole of northern Africa, overwhelmed the Gothic kingdom in Spain, and even penetrated beyond the Pyrenees to the conquest of the province of Narbonne. One of the chief effects of these Arab conquests was that Christian civilization became gradually confoederated to Europe; another was that the trade routes to the East were closed to the Western nations. The conquest of Narbonne marked the limit of the advance of Islam in western Europe, for in 732 the Arabs were overthrown by Charles Martel in the battle of Tours, a few years later were driven out of Gaul. In Spain, however, they succeeded in maintaining themselves throughout the middle ages, developing a high type of civilization which had considerable influence on the intellectual life of medieval Europe, and it was not till 1492 that Granada, their last possession in the peninsula, was conquered by the Christian monarchs, Ferdinand and Isabella.

The battle of Tours emphasized and increased the power and reputation of Charles Martel. As a mayor of the palace to the decadent Merovingian successors of Clovis, he was virtually ruler of the Franks, and, after his death, the last of the rois fainéants of the house of Merovech was deposed, and Pippin, Charles's son, was elected king of the Franks. The prestige of the Carolingian house (to give it the name it was later known by) was increased when, at the urgent entreaty of Pope Stephen III, Pippin marched into Italy and saved Rome from the Lombards, who were endeavouring to extend their power southwards. Pippin's son Charles (Charlemagne) finally conquered the Lombards in 774 and thus added part of northern Italy to his dominions.

In 797 an event of the highest importance to the European world took place. The emperor Constantine VI. was deposed by his mother Irene, who seized the throne. Thereupon Pope Leo and the Roman people definitely threw off the authority of the emperors of Constantinople, on the ground that a woman could not hold the position of Caesar. In 800 Leo crowned Charlemagne emperor at Rome, and henceforth till 1453, when Constantine was deposed by the Turks, there was an Eastern and a Western empire. Till his death in 814 Charlemagne was king of the Franks as well as emperor. His kingdom embraced not only all Germany and modern France, but included a large part of Italy and Spain as far as the Ebro. Under his rule Western Europe was united in a powerful empire, in the organization of which the principles of Roman and Teutonic administration were blended; and, after his death, he left to his successors, the Frankish and German kings, the tradition of a centralized government which subdued the chaos of the period that followed, and the prescriptive right to the title and prestige of Roman emperors—a tradition and a claim that were to exercise a notable effect on the development of European history for centuries to come. (See France: History and Charlemagne.)

The period from the death of Charlemagne (814) to the 14th century is characterized in western Europe by the general weakening of the idea of central government and by the rise of feudalism. During the same period the East Roman or Byzantine empire escaped disruption and, preserving the traditions of Roman civil and military administration, formed an effective barrier to Europe and Christendom against the advancing tide of Islam. At the same time, however, the growing divergence between the Eastern and Western Churches, which had been accentuated by the iconoclastic controversy (see Iconoclasts), and, destined in 1054 to culminate in a definite schism, was gradually widening the breach between the two types of European civilization, which came into violent conflict at the beginning of the 14th century, when crusaders from western Europe captured Constantinople and set up a Latin empire in the East (see ROMAN EMPIRE, LATER; CHURCH HISTORY; CRUSADES). In western Europe, meanwhile, the unity of the empire did not last. Charlemagne's definite break-up dates from the treaty of Verdun (843), by which Charles the Bald received Neustria, Aquitaine and western Burgundy, Louis the German Bavaria, Swabia, Saxony and Thuringia, and the emperor Lothair the middle kingdom known by his name, the regnum Lotharii or Lotharingia (see LORRAINE). By the partition of Mansfeld (870) Lotharingia itself was divided between the West and East Frankish realms—France and Germany, terms which from this time begin to represent true national divisions. With the treaties of Verdun and Mersen the history of the European state system may be said to begin.

At first, indeed, it seemed as though the nascent states were about to be dissolved by disruption from within and attacks from without. All alike were subject to the attacks of the Norse sea-rovers, hardy pirates who not only scourged all the coasts of Europe but penetrated, burning and harrying, far inland up the great waterways. Meanwhile, the weakening of central government due to dynastic
struggles had led to the growth of independent or semi-independent powers within the states themselves. The Frank landowners had successfully asserted their independence of the jurisdiction of the king (or emperor) and his officials; the imperial officials themselves, dukes or counts, had received grants of lands with similar immunities (beneficia), and these became hereditary. Thus sprang up a class of great territorial nobles to whom, amid the growing anarchy, men looked for protection rather than to the weak and remote central power; and so, out of the chaos that followed the break-up of the empire of Charlemagne, was born the feudal system of the middle ages (see Feudalism). This organization was admirable for defence; and with its aid, before the close of the first decade of the 11th century, the frontiers of France and Germany had been made safe against the northern barbarians, who had either been driven off and barriers erected against their return — e.g., the marks established by Henry the Fowler along the middle Elbe — or, as in the case of the Normans, absorbed into a system well adapted for such a process. By the treaty of St. Claire-sur-Epte (911) between Charles the Simple and Rollo, chief of the Norsemen, the Normans were established in the country since known as Normandy. In England, by the treaty of Wedmore (898) between Alfred and the Danish king Guthrum, the Danes had already been established in a large part of England.

Feudalism, by the time the Northmen had been subdued by its aid, was quite firmly established in the western part of Europe. During the 11th century it was carried by the Normans into England, into Sicily and southern Italy, and by the Normans of the first crusade into the newly established kingdom of Jerusalem (1099). By the kings of France, England and Germany, however, who saw themselves in danger of being stripped of all but the semblance of power by its delegation to their more or less nominal vassals, the feudal organization was early recognized as impossible as a form of state government, if the state was to be preserved; and the history of the three great European powers during the succeeding centuries is mainly that of the struggle of the sovereignties against the disruptive ambitions of the great feudal nobles. In England the problem was, from the outset, simplified; for though William the Conqueror introduced the system of feudal land tenure into England in 1066, he reduced it to the new form of government, retaining alongside of it the old English national policy. In France, on the other hand, feudalism as a system of government had become firmly established; and it was not till the days of Philip Augustus (1180-1223) and Louis IX. (1226-1270) that the monarchy began to get the upper hand. From this time until the 14th century the power of the French monarchy, in spite of occasional lapses, grew steadily stronger. The reverse was the case with the German kingship. Its association with the undeclared claims involved in the title of Roman emperor, traditionally attached to it, and notably those to authority in Italy, necessitated concession after concession to the feudal nobles, in order to purchase their support for their assertion. The kingship, moreover, became elective; the imperial title was obtainable only at Rome at the hands of the pope; and the German kings thus became entangled in contests, not only with their own vassals, but with the tremendous spiritual force of the medieval papacy by which, for its own ends, the spirit of feudal insubordination was from time to time fomented. Thus in Germany the feudal nobles gradually acquired a sovereign status which, in some cases, has survived the territorial rearrangements of the 19th century and left its mark on the federal constitution of modern Germany; while the kingship and the imperial title grew more and more shadowy till in 1806 it vanished altogether. (See ENGLISH HISTORY; FRANCE: History; GERMANY: History.)

Hug the Great, the most powerful of the territorial magnates, was chosen king of France. With his election dates the real beginning of the French monarchy, and under him and his successors Paris became the capital of France. Hug's election, however, was the work of the great feudatories, and France remained divided among a number of great fiefs, of which the chief were Brittany, Anjou, Flanders, Vermandois, Champagne, Burgundy, Aquitaine, Poitou, Gascony, Toulouse and Normandy.

While the central power in France advanced slowly but steadily, the development of the royal authority in Germany was in the 10th and 11th centuries more rapid. In 911 the German magnates had elected Conrad the Franconian to reign over them, and in 919 Henry "the Fowler" of Saxony, "whose reign forms one of the great-turning-points in the history of the German nation." He defeated the Hungarians, the Slavs and the Danes, and by encouraging the growth and development of towns he contributed greatly to the formation of the German kingdom. His immediate successors, Otto the Great and Otto II., continued his work, which was only interrupted for a short time during the reign of Henry I. (919-936), whose "cosmopolitan imperialism brought him into conflict with the church, which had proceeded to the utmost extent with the German nobles. Henry II. (1002-1024) asserted his success his authority over Germany, and his successor Conrad II., who belonged to the Salian or Franconian line, did much to secure unity and prosperity to the Empire. His son and successor Henry III. (1050-1066) governed Germany wisely, and his reign witnessed the culminating point of the Holy Roman Empire. At the time of his death it seemed probable that Germany, like England and France, would gradually escape from the thraldom of the great feudatories. The future of the German monarchy depended upon the ability of future kings to suppress the forces of feudal disintegration in Germany, and to withstand the temptation of struggling to establish their influence over Italy.

Unfortunately for German kingship Henry IV. (1056-1106) was only six years old on his accession, and when he became a man he found that the papacy under Hildebrand's influence was practically independent of the emperor. Had Henry confined his efforts to coercing the German barons he might, like the Normans and Angevins in England, and like the Capetians in France, have proved successful. Unfortunately for Germany Henry entered upon the famous contest with the papacy under Gregory VII. (1073-1085), which ended in the 13th century in the defeat of the Empire in the person of Frederick II. The struggle began in 1073 over the question of investiture (q.e.), and widened into a duel between the spiritual and temporal powers. During the early years of the contest the influence of the papacy reached a high pitch and made itself felt in the crusading movement, which received its first impetus from Pope Urban II., who appealed to Europe at the council of Clermont in 1095 to recover the Holy Places from the Turks.

During the 12th century the Eastern Empire was attacked by the Russians, the Normans and the Seljuks. The emperor Alexius Cononinis found himself on his accession in 1081 threatened by the Seljuks (the victors in the decisive battle of itsakert in 1071) and by the Sicilian Normans who in 1087 besieged Durazzo. In 1083 he defeated the Normans in the battle of Durazzo, and in 1085 with the death of Robert Guiscard in 1085 all danger from a fresh Norman invasion passed away. But the first crusade brought new anxieties to Alexius, for he feared that the crusaders might attack Constantinople. That fear removed, he took advantage of the increased connexion between eastern and western Europe by bestowing commercial privileges upon the Italian trading republics, who thus gained access to the ports of the Empire on easy terms.

With the era of the Crusades, which lasted till the middle of the 13th century, Europe entered upon a period of change, the importance of which is realized by comparing the condition of western Christendom in the 11th with its condition in the 13th century. Between the opening and close of the crusading movement Europe underwent a complete revolution. While the
Crusades tended to enhance the prestige and authority of the papacy and the power of European monarchs, they also led to increased knowledge of the East, to the rapid development of commerce, to the introduction of new industries, to the rapid decline of the influence of the feudal nobility, and to the rapid development of town life (see COMMUNE). At the same time the Hildebrandine reformation was having an immense influence upon the intellectual condition of Europe. The 12th century saw the establishment of many new monastic orders (see MONASTICISM), and at the same time a remarkable speculative and literary revival (see SCHOLASTICISM). This movement owed not a little of its success to the influence of the Crusades, which stirred up intellectual as well as commercial activity. This intellectual activity, as well as the fruits of commercial expansion, were since learning was still a monopoly of the clerical order—weapons in the hands of the papacy, which in the 12th century attained the height of its power, if not of its pretensions. It is, indeed, impossible to exaggerate the influence of the Roman Church upon the development of Europe at this period. The popes, in fact, perceived Europe in a sense that could not be predicated of the emperors; the terror of their spiritual power, their vast wealth derived from the tribute of all the West, their unique experience of international affairs, and—in the case of the great popes of this epoch—the superiority of their minds and characters, made them not only the spiritual rulers of Europe, but the effective centres of whatever political unity it possessed. As a Byzantine observer was to observe of Innocent III., they had become the successors of the Caesars rather than of Peter (see PAUCY).

Nowhere were the beneficial effects of the Crusades seen more clearly than in France. The smaller fiefs were steadily absorbed by the greater lordships, which in their turn fell victims to the royal power. It might almost be said that "modern France is a creation of the Crusades." The effects of the crusading movement were felt in France as early as the reign of Louis VI. (1108–1137). Aided by his able minister Suger, Louis managed before his death to add to the possessions of his house the Île de France and a prospective claim to Poitou and Aquitaine. Under his successor Louis VII. (1137–1180) the consolidation movement was checked owing to the marriage of Eleanor of Aquitaine (after her divorce from Louis VII.) to Henry II. of England. By the addition of his wife's lands (Gascony and Guienne) to those which he had already inherited from his father and mother (Normandy, Anjou, Touraine and Maine) Henry was enabled to form the powerful though short-lived Angevin empire. But the lost ground was rapidly recovered by Philip Augustus (1180–1223), who took advantage of the weakness and folly of John of England, and before 1215 had united firmly to France Normandy, Maine, Anjou and Touraine. Louis VIII. and Louis IX. adhered firmly to the policy of Philip IV., and in 1258, by the treaty of Paris, Henry III. of England recognized the loss of Poitou. There thus remained to England out of the vast continental domains of Henry II. only Gascony and Guienne.

The rest of Europe was also in various degrees affected by the Crusades. While Spain was occupied in a crusade of her own against the Moors and gradually driving them into Granada, Germany, Italy, and to some extent England, were interested in, and influenced by, the Crusades against the Turks. During the absence of many of the nobles in the East the growth of towns and the development of the mercantile class proceeded without interruption. The trading classes demanded strong governments and equal justice, and vigorously supported the monarchs in their suppression of feudalism.

During the 12th and 13th centuries the Crusades thus proved a large factor in the commercial prosperity of the Italian maritime states, an "open door" between East and West was secured, and reinforcements from Europe were poured into Syria as long as the peoples of the West regarded the stability of the Latin kingdom of Syria as a matter of prime importance. During the crusading period a check was placed to the tide of Mahomedan conquest, while to the caliphate the crusaders proved a perpetual drain upon its material resources. To the Mahomedans the possession of the Holy Places by the Christians was as great a humiliation as their desecration by the Mahomedans was to the crusaders. Unfortunately the Crusades led to a disastrous schism between the Byzantine empire and western Christendom, which had calamitous results. The decay of the crusading spirit was a necessary result of the growth of the consolidation of the European nations, but the price paid was the fall of Constantinople and the establishment of the Turks in eastern Europe. The Crusades thus not only postponed the conquest of Constantinople by the Turks for some two hundred years, but led, as had already been said, to a vast expansion of commerce, as seen in the rapid growth and development of the Italian cities, and to a striking development of town life.

The Crusades had enormously strengthened the power and prestige of the papacy, and indirectly contributed to its victory over the Empire in the person of Frederick II. From the death of the emperor Henry IV. to the death of Frederick II. in 1250 the struggle between the Empire and the papacy continued, and is coincident in point of time with the Crusades. The reign of Frederick Barbarossa (1152–1190) saw that struggle at its height, and during that reign it became apparent that the emperor's efforts to unite Italy and Germany under one crown were doomed to failure. The rise and success of the alliance of Italian republics known as the Lombard League no doubt contributed to the success of the papacy, but in their contest with the popes the emperors never had any chance of gaining a permanent victory. Frederick II. continued with great energy to attempt the hopeless task of dominating the papacy, but his possession of Sicily only made the popes more determined than ever to establish their predominance in Italy. Frederick's death in 1250 marked not only the triumph of the papacy in Italy, but also that of feudalism in Germany. "He has been called the 'most dazing of the long line of imperial failures,' and with him ends the Empire as it was originally conceived. Henceforward the Holy Roman Empire, which implied the unity of Italy and Germany, and the close alliance of pope and emperor, no longer existed in name, and its place is taken by a glorified German kingship presiding over a confederation of turbulent German nobles.

Thus with the later years of the 13th century Europe had arrived at the definite close of one epoch and the beginning of another. The period of the Crusades was over, the theory of the Holy Roman Empire had broken down. The period from the beginning of the 14th to the close of the 15th century might well be styled the latter days of medieval Europe.

During the 14th and 15th centuries the idea of regarding Europe as one state in which emperor and pope presided over a number of subordinate kings gave way before the spirit of nationalism and particularism. England, France and Spain were coming strong centralized monarchies which stood in striking contrast to the weakened Empires. Partly to a doubt owing to the failure of the Empire and papacy to work together, a great impetus had been given to the formation of national monarchies. While Frederick II. had failed, Louis IX. and Philip IV. of France, Ferdinand III. of Castile (1217–1252), James the Conqueror, king of Aragon (1213–1276) and Edward I. of England (1230–1307) succeeded in laying the foundations of strong monarchies which after two centuries of struggles with the dyin foundations of strong monarchies which after two centuries of struggles with the dyin foundations of strong monarchies which after two centuries of struggles with the dyin foundations of strong monarchies which after two centuries of struggles with the dyin foundations of strong monarchies which after two centuries of struggles with the dyin foundations of strong monarchies which after two centuries of struggles with the dyin foundations of strong monarchies which after two centuries of struggles with the dyin foundations of strong monarchies which after two centuries of struggles with the dyin foundations of strong monarchies which after two centuries of struggles with the dyin
The triumph of the papacy over the Empire had been short-lived. Owing to the disturbed state of Italy, Clement V. was in 1305 compelled to take refuge at Avignon, and till 1377—a period known as the Babylonian captivity—the popes remained in France. While the Empire and papacy steadily declined, while the Byzantine empire falls before the Turks, strong monarchies are gradually formed in England, France, Spain, and Portugal, and in Italy the Renaissance movement covers the later years of the 15th century with glory (see RENAISSANCE). During these centuries there is common to Europe no one principle which is to be found in all kingdoms. But while the old system, founded on belief in the unity of Europe under the Empire and papacy, declines amid chaos and turbulence, there is much intellectual and political activity which portends the appearance of an entirely new state of things. The 14th and 15th centuries may truly be styled a period of transition.

From the death of Conrad IV., the son of Frederick II., in 1254 to 1273, when Rudolph of Habsburg became king, chaos reigned in Germany, and the period is known as the Great Intercnemn. The forces of decentralization strengthened themselves, and the emperors found that the formation of a strong and united German kingdom was an impossibility. Rudolph of Habsburg (1273-1291), realizing what were the limits of his power in Germany and the futility of attempting to establish his hold upon Italy, began that policy of family aggrandizement which was continued so notably by successive members of his house. His reign witnessed the firm establishment of the house of Anjou in Naples, and, and after the Sicilian Vespers in 1282, the supremacy of the house of Aragon in Sicily. Refusing to follow the example of Frederick II. and to take part in distant expeditions, Rudolph conquered Austria, Styria, Carinthia and Carniola, Vienna became the capital of the Habsburg dominions in Germany, and his son Albert of Austria, who was king from 1298 to 1308, was chosen in 1308 to continue the policy of his father. Though no Habsburg was again elected to the imperial throne till 1438, when the long succession of emperors began which continued unbroken till 1742, the establishment of the Habsburgs in Austria by Rudolph proved an event of European importance. From that time the leading members of the Habsburg family never lost an opportunity of aggrandizement. In 1335 they received Carinthia, in 1363 the Tirol. While, however, the Habsburgs, the Wittelsbachs and later the house of Brandenburg were strengthening themselves, the Empire was steadily declining in power and influence. The 14th century saw Switzerland shake itself free from the Austrian house and establish its independence, which was, however, not formally acknowledged till the treaty of Westphalia in 1648.

During the 14th century the weakness of the Empire became more and more accentuated under the weak rule of Louis IV. On his death in 1346 his successor Charles of Luxembourg, known as the emperor Charles IV., was a creature of the papacy and did not form a strong centralized German monarchy. With that object he issued in 1356 the Golden Bull, by which it was hoped that all matters connected with the imperial election would be settled. The number of imperial electors was settled, and henceforth they were to consist of the archbishops of Cologne, Mainz and Trier, and of the king of Bohemia, the duke of Saxony, the margrave of Brandenburg and the count palatine of the Rhine. Charles hoped to concentrate gradually in his house all the chief German provinces, and having by the Golden Bull endeavoured to check the growth of the towns, he expected to establish firmly the imperial influence in Germany. But the towns were too strong to be coerced, and during his reign the Swabian cities formed a union; and though the marriage of his son Sigismund to the heiress of the king of Hungary and Poland, and the possession of Brandenburg, which fell to him in 1357, seemed steps towards the realization of his hopes, his death in 1378 left his work unfinished. Moreover, his son and successor Wenceslaus (1378-1410) proved, like Richard II. of England and Charles VI. of France, unequal to the task of checking the growing independence of the nobles and the cities. The Hanseatic League (q.v.) was at the height of its power, and in 1381 the Rhenish princes formed a confederacy. Wenceslaus, like Richard II., had fallen upon evil times. The advance westwards by the Turks occupied the attention of his brother Sigismund, now king of Hungary; he was himself unpopular in Bohemia, and at the same time was exposed to the intrigues of his cousin Jobst of Moravia, who had secured Brandenburg. In 1400 Wenceslaus was formally deposed by the electors, and spent the rest of his life in Bohemia, where he died in 1419. His successor Ruprecht of the patriciate reigned from 1400 to 1410, and during his reign the council of Pisa endeavoured to bring to an end the great schism which had followed upon the return of Pope Urban VI. from Avignon to Rome in 1377. Two popes had been elected, one living at Rome, the other at Avignon, and Christian Europe was scandalized at the sight of two rival pontiffs. On Ruprecht's death the electors chose Sigismund the brother of Wenceslaus, and he ruled as emperor from 1411 to 1437.

Thus at the beginning of the 15th century the papacy was seen to have fallen from the high position which it occupied at the time of the death of Frederick II. The Avignon captivity followed by the great schism weakened its temporal as well as its spiritual power and prestige, while national developments and dynastic ambitions, such as led to the Hundred Years' War, diverted men's minds from religious to purely temporal concerns. The work of Wycliffe and Hus illustrated not only the decline of papal prestige but also the general opinion that reform in the papacy was necessary. Sigismund's reign as emperor was rendered noteworthy by the part which he took in the council of Constance (q.v.), and by his successful efforts to suppress the Hussite movement in Bohemia (see Hussites). That country on the death of Wenceslaus in 1419 fell to Sigismund, but it was not till 1431, after a long and sanguinary war, that the opposition to the union of Bohemia with the Empire was suppressed. Led by Ziska and other able chiefs, the Bohemians were able to suppress the Hussite movement in a vigorous attempt to secure their independence. In 1435 Sigismund was formally acknowledged king of Bohemia. In 1431, the year of the final overthrow of the Bohemians and the Hussites, he opened the council of Basel (q.v.), being resolved to establish a religious peace in Europe and to prevent the Hussite doctrines from spreading into Germany. In 1438 Sigismund died, leaving Germany involved in a quarrel with the papacy, but having successfully withstood the efforts of the Bohemians to acquire independence. Sigismund's death marks an epoch in the history of the Empire, for his successor Albert of Austria proved to be the first of a long line of Habsburg emperors. Albert himself reigned only from 1438 to 1440, but on his death the imperial dignity was conferred upon another member of the Habsburg house, Frederick, duke of Styria and Carinthia, known as the emperor Frederick III. With his accession the imperial throne became practically hereditary in the Habsburg family. Frederick's long reign, which lasted from 1440 to 1493, was of little benefit to Germany; for he showed no administrative skill and proved a weak and incapable ruler. Undoubtedly his lot fell upon evil days, for not only were the Turks at the height of their power, but both Bohemia and Hungary gave him much anxiety. The imminent fall of Constantinople, the last barrier of Christendom against Islam in the East, was a threat not only to the Empire, but to all Christian Europe. But western Europe was too much occupied with internecine feuds to unite effectively against the common enemy. In vain the emperor John VI. had gone in person to solicit aid at the various courts of the West; in vain he had humbly himself to pay the price asked, by subscribing to the abnegation of the distinctive tenets of the Orthodox Church, which secured the ephemeral reunion of Christendom at the council of Florence (1438). The crusading spirit was dead; the European powers stirred no longer to save the imperial city; and in 1453 Sultan Mahommed II. rode through the breach over the body of the last of the Eastern
Caesars, and planted the crescent on the dome of the metropolitan church of Eastern Christendom (see TURKEY; and ROMAN EMPIRE, LATER).

The fall of Constantinople marked the definite establishment on European soil of a power alien and hostile to all that was characteristic of European civilization. It was a power, moreover, which could live only by expanding; and for over two hundred years to come the dread of Ottoman aggression was a dominant factor in the politics of eastern Europe. The tide of Turkish advance could have been arrested by a union of Europe; but the appeals of Pope Nicholas V. fell unheeded upon a sceptical age, intent only on its dynastic and particularist ambitions. To the emperor the ousting of the Ottomans from the Balkan peninsula seemed of less importance than the consolidation of the Habsburg power in Germany, and its extension over the neighbouring kingdoms of Hungary and Bohemia. France was exhausted by the long agony of the Hundred Years' War, which came to an end the very year of the fall of Constantinople, and the French kings—especially Louis XI. (1461-1483)—were busy for the rest of the century crushing out the remnants of feudalism and consolidating the power of the monarchy. As for Italy, with its petty tyrants and its condottieri, there was no hope of uniting it for any purpose whatever, least of all a religious or national purpose, and Spain was busy with her own crusades against the Moors. The kingdom of John Hunyadi, king of Hungary, against the Turks, therefore, remained isolated and unsupported. In 1456 he checked their advance northwards by a brilliant victory which led to the relief of Belgrade; but he died the same year, and his death was followed by a struggle for the succession between Hungarians and Bohemians. The racial and religious quarrels of the Balkan peoples had made it possible for the Turks to obtain a foothold in Europe; the jealousies and internecine struggles of the Christian states made possible the vast expansion of the Ottoman power, which in the 17th century was to advance the frontiers of Islam to those of Germany and to reduce the emperors, in their relations with the Porte, to the status of tributary princes.

The victory of Ladislaus, son of Casimir, king of Poland, who succeeded in uniting in his own person the crowns of Bohemia, Hungary and Poland, threatened to result in the permanent independence of those countries of the house of Habsburg. But in 1450 Ladislaus was compelled by Maximilian, son of Frederick III., to sign the treaty of Plessburg, providing for the eventual succession of the Habsburgs over Hungary and Bohemia. In other parts of the realm of Frederick III. laid the foundations of the greatness of his family. In 1477 Maximilian married Mary, duchess of Burgundy and heiress of Charles the Bold, and through her the Habsburgs obtained Franche Comté and the Netherlands. The line, Bella gerant Austria nube, well described the method by which the house of Habsburg increased its possessions and established its fortunes. A.E.I.O.U. (Austriae est imperare orbis universo) was the device invented for his house at that time by Frederick III. and it proved no idle boast. Maximilian I., the son of Frederick III., reigned from 1493 to 1519, and during his reign Europe passed from medieval to modern times. Some reforms in the Empire were carried out, but the events of his reign made it apparent that it was impossible to set up a centralized monarchy in Germany (see MAXIMILIAN I.; GERMANY and AUSTRIA; HISTORY).

Far different developments were taking place during the 14th and 15th centuries in France, Spain, the Scandinavian north and in England. During the greater part of the 14th century France was engaged in foreign wars and internal complications, and it seemed doubtful if a strong centralized monarchy would be firmly established. The failure of Philip VI. (1328-1350) and John (1350-1364) in their contest with England weakened the central power in France, and, though Charles V. (1364-1389), owing to his own sagacity and the weakness of the English government, managed to regain for France many of her lost provinces, the French power both at home and abroad again declined under the rule of the incapable Charles VII. (1480-1492). In fact the year 1492 may be said to mark the lowest stage in the history of the French monarchy. From that year an improvement gradually set in. A national sentiment, as exemplified in the career of Joan of Arc (q.v.), was developed; an alliance, essential for the successful expulsion of the English from France, was made in 1453 between the king of France and the duke of Burgundy; and in 1493 the famous ordinance empowering the king to maintain a standing army and to raise money for its maintenance was passed at Orleans by the states-general. These measures proved successful; in 1453 the Hundred Years' War came to an end, and Louis XI. managed between 1461 and 1483 to establish an absolutism in France on sure foundations. Under his successor Charles VIII. (1483-1498), Brittany was annexed, and France, secure from all danger of a feudal reaction, entered with the invasion of Italy in 1494 by Charles VIII. upon modern times. A similar process is observable in England and Spain. In England the Wars of the Roses were followed by the establishment of a strong monarchy under Henry VII., while in Spain Ferdinand and Isabella established in place of anarchy the royal authority, and during their reign suppressed all attempts at provincial independence.

In 1491 the consolidation of Spain was completed by the conquest of Granada. In 1497, by the union of Calmar, the three kingdoms of Norway, Sweden and Denmark were united under Eric XIII. This union was, however, short-lived, and in the early years of the 16th century came definitely to an end (see NORWAY; SWEDEN; DENMARK).

The close of the middle ages and the beginning of modern times was marked by several noteworthy events. The invention of printing, the discovery of America and the invasion of Italy by Charles VIII. all occurred before the end of the 15th century, while in the early years of the 16th century the ideal of civil and ecclesiastical unity was finally shattered by the Reformations and by the development of the modern states system, accompanied by the prominence henceforward attached to the question of the balance of power.

During the whole of the 15th century Europe had been affected by what is known as the Renaissance movement, which marked the transition from the medieval to the modern order. This movement, caused by the growth of learning, had its first home in Italy, which had witnessed a marvellous revival of interest in classical antiquity, in painting and sculpture, accompanied by a keen intellectual activity in religious and political, no less than in literary matters. Criticism of existing beliefs was developed, knowledge became widely diffused, and, while the way was prepared for the substitution of individualism for the old ecclesiastical system, the development of commerce coincident with the discovery of America and the establishment of monopolistic systems destroyed feudalism (see RENAISSANCE). The later years of the 15th, and the early years of the 16th, centuries may be described as the transition from medievalism to modern times, from feudalism to individualism, from the idea of a world church and a world empire to one in which national consolidation was the chief feature and monarchical government a necessity.

From the beginning of the 16th century Europe entered upon modern times. Many events marked the close of the middle ages. The discovery of America, the decay of Venice, the development of the European states system, the rise of diplomacy as a permanent international system (see DIPLOMACY), the wars of religion—all these are the general characteristics of the new Europe which now enters. With the growth of monarchies arises the belief in the divine right of kings, the development of territorial sovereignty, and wars of ambition like those waged by Louis XIV.

With the 18th century democratic ideas first begin to appear side by side with the rule of the enlightened despots such as Frederick the Great, Catherine II. and Joseph II. The outbreak of the French Revolution brings to an end the old European system, upsets the ideas on which it was founded, and leads to important territorial changes.
EUROPE

The advent of the Reformation, as has already been pointed out, finally shattered that ideal of civil and religious unity which had been the main characteristic of the Middle Ages. Thus from the beginning of the 16th century Europe sees the development of the modern states system and becomes the scene of national wars in which the idea of the balance of power was the leading principle (see BALANCE OF POWER). That principle did not allow of the recognition of the rights of nationalities, and till the wars of the French Revolution the interests of the various European states were usually subordinated to the dynastic aims of their rulers. During the ensuing centuries the balance of power in Europe was seriously threatened; during the first half of the 16th century by Charles V., during the latter half of the same century by Philip II., in the first half of the 17th century by the house of Habsburg, and in the latter half by Louis XIV.

The close of the Seven Years' War seemed to prelude a period of British ascendancy on the continent, but that danger passed away with the outbreak of the war between Great Britain and her American colonies. For a time the balance of power in Europe was completely shattered by Napoleon's brilliant conquests, but his fall, while a great extent restoring the political equilibrium, gave an opportunity to Alexander of Russia to dominate Europe. Thus the 16th century definitely marked the beginning of modern times both from a political as well as from a religious point of view.

With the accession of Francis I. to the French and Charles V. to the imperial throne began the long rivalry between France and the house of Habsburg, which continued with few interruptions until 1756. In the struggle between Charles V. and Francis I., which began in 1521, the former had the advantage, and the battle of Pavia (1525) seemed likely to lead to the permanent pre-eminence of the imperial cause. But unexpected allies were found by Francis in the German reformers and in the Turks. The nailing by Luther of his ninety-five theses to the door of the Wittenberg church, followed by the decisions of the diet of Worms in 1521, led to a rapid development of Lutheran opinions among the princes of the north of Germany. Charles V.'s victory over France in 1525 and his reconciliation with the papacy in 1529 seemed, however, to preclude the suppression of the Protestant opinions. But Francis I. again took up arms, while the invasions of Suleiman the Magnificent, during whose reign the Turkish influence was not only felt in Hungary and Germany but extended to the west of the Mediterranean, forced Charles to temporize. When in 1544 the conclusion of the peace of Crépy with Francis I. enabled Charles to turn his attention to the rapid growth of Protestantism, it was too late to adopt with any chance of success a policy of suppression. In 1552 he found himself compelled to agree to the treaty of Passau which implied the adoption of a policy of compromise, and which in 1555 was followed by a definite arrangement at Augsburg, which admitted the principle of cuius regio, ejus religio. Till the outbreak of the Thirty Years' War in 1618, the settlement of Augsburg tended to keep peace between the Catholics and the Protestants. Equally unsuccessful were Charles's later efforts against France; in 1553 he lost Metz, Toul and Verdun, and in 1556 he retired to Spain, leaving the Empire to his brother Ferdinand, and Spain, the Netherlands and his Italian possessions to his son Philip. The latter, after winning the battle of St Quentin in 1557, made peace with Henry II. of France by the treaty of Cateau-Cambresis in 1559.

By this peace a term was put to the struggle between France on the one hand and the Empire on the other, and the kings of France and Spain were enabled to turn their attention to the issues raised by the immense growth of Protestantism since 1521. While Charles V. had been engaged in his struggles with the Turks and the French, Protestantism had rapidly developed. In Sweden, in Denmark, in England, in various parts of Germany, and in France Protestant principles had been largely adopted (see REFORMATION).

Though the forces of Roman Catholicism had for a time been vanquished they had still to be counted with. For the middle of the 16th century the growth of Protestantism began to be checked, and a period of reaction against the Reformation set in. For a time it seemed that the efforts of Roman Catholicism would be successful and that the cause of Protestantism would be permanently weakened. The papacy since the beginning of the 16th century had reformed itself, the council of Trent (c.), which closed its sittings in 1564, had given Roman Catholicism a "clearly and sharply defined body of doctrine," and the Catholic Church had become "more united, less worldly, and more dependent on herself." In this work of reorganization the Jesuits had played a great part, and the success of the Counter-Reformation was largely due to their efforts (see JESUITS). Paul III., Pius IV. and V., Gregory XIII. and Sixtus V. are all good examples of the reforming popes of the 16th century. Under them the Jesuits worked; they restored Catholicism in Poland, Bohemia and south Germany; and supported by them the Inquisition crushed Protestantism out of Spain and Italy.

The interest of the Counter-Reformation movement from 1559 to 1618 centres round Philip II. of Spain. While Pius V. (1566-1572) is the best example of the Counter-Reformation popes, Philip II. took the lead among the European Catholic monarchs in working for the extinction of Protestantism. His recovery of the southern Netherlands for the Catholic cause, his attempt to conquer England, his intention of subjugating France, were all parts of a scheme to advance simultaneously his own power and that of the Counter-Reformation.

Circumstances combined to aid Philip, and while he was endeavouring to carry out his political aims, the Jesuits were busily occupied in winning back large portions of Europe to allegiance to the papacy. But failure attended most of Philip's projects. Though he succeeded in recovering the southern or Walloon provinces of the Netherlands, he was unable to conquer the northern provinces, which under William of Orange formed themselves into the Dutch republic (see HOLLAND: HISTORY). His scheme for the conquest of England failed, and the Spanish Armada was totally defeated in 1588. Nor was his plan for the subjection of France more successful. After a tedious civil war between the Catholics and Huguenots, Henry of Navarre appeared as a national leader, who, having overcome the armies of the League with which Philip was allied, concluded the peace of Vervins in 1598. In consenting to this treaty Philip acknowledged that his schemes for the establishment of his influence over France had failed. Thus, when the 16th century closed, England's independence was assured, the Dutch republic was established, the French monarchy was rapidly recovering from the effects of the religious wars and the decadence of the Spanish monarchy had set in. But the religious question was still unsettled, religious passions ran high, and no satisfactory agreement between Catholicism and Protestantism had been, or seemed likely to be arrived at. The successes of the Counter-Reformation under the Jesuits and such men as Ferdinand of Spain (afterwards the emperor Ferdinand II.) and Maximilian of Bavaria only roused suspicious opposition on the part of Calvinist princes such as Frederick IV., the elector palatine.

Various events had indicated the approach of a final struggle between Protestantism and Catholicism during the early years of the 17th century. The seizure of Donaúworth, a town with Protestant sympathies, by Maximilian of Bavaria in 1607, the formation of the Protestant Union in 1618 and of the Catholic League in 1609, the questions raised in 1609 by the Cleves-Jülich affair, the preparations of Henry IV. of France for an anti-Habsburg campaign—all these showed that the political atmosphere was charged with electricity. Till 1618, however, an open conflict between Protestantism and Catholicism in Germany was averted; in that year the acceptance, by the Calvinist Frederick, the elector palatine,
of the crown of Bohemia, proved the starting-point of the Thirty Years' War.

Till the death of Gustavus Adolphus in 1632 that war preserved a religious or semi-religious character. The emperor Ferdinand II., Philip III. of Spain and Maximilian of Bavaria undoubtedly hoped to suppress Protestantism in Germany, while Wallenstein, the great imperial general, was prepared to conquer Denmark, Sweden and Norway, and to convert the Baltic into an Austrian lake. Though the resistance of Christian IV. of Denmark was vain, the jealousy felt by the Catholic princes of Wallenstein and the skill of Gustavus Adolphus caused the total failure of these ambitious schemes. All hope of seeing the imperial flag waving over the Baltic was dispelled by the victory of Breitenfeld, and that of Lützen in 1632, and though Gustavus Adolphus fell in the last-named battle, he had saved north Germany from falling into the hands of the Jesuits.

With his death the Thirty Years' War became in the main a political struggle between France and the Habsburgs—a continuation of the wars of Francis I. and Henry II. against Charles V., and of the war between Henry IV. and Philip II. Ferdinand II. had attempted to carry back the religious history of the Empire more than seventy years, and had failed. He had endeavoured to make the Empire a reality and to revive and carry out the designs of Charles V. His failure was now complete. The edict of Restitution issued in 1629 remained a dead letter, and from 1632 to 1648 he and his successor Ferdinand III. had to employ all their energies in defending their possessions from the attacks of the French and Swedes.

The death of Gustavus Adolphus followed in 1634 by the assassination of Wallenstein proved an admirable opportunity for the entry of France into the Thirty Years' War. And till 1645, in spite of occasional reverses, the French and their allies gradually wore down their adversaries. After the death of Henry IV. in 1610 France had temporarily retired from a foremost place in the politics of Europe, and for some thirty years her ministers were busy in coercing the Huguenots and establishing the supremacy of the crown which was threatened by the nobles. Once united at home France was ready and eager to seize the opportunity. By placing a severe check upon the Habsburgs in Spain and Austria, the time for such action was well chosen. Austria was weakened by the war which had been waged since 1618, while Spain, exhausted by her efforts in the preceding century, had entered upon a long period of decay, and was about to see Portugal regain its independence. The Protestant princes in the north of Germany were ready to ally with France and Sweden against the emperor, even the Catholic Bavarian duke was to prove a doubtful ally of the Habsburg house. In 1642 Richelieu and in 1643 Louis XIII. died, but though Louis XIV. was an infant, and the French nobles by their cabals hindered the work of the regency, Mazarin successfully carried out the anti-Habsburg policy of his predecessors and brought the war against Austria to a successful conclusion. (See further Thirty Years' War.)

The peace of Westphalia in 1648 marked the virtual close of religious conflicts in Europe. It also marked the end of the attempts of the Habsburgs to establish a monarchical system throughout all Germany. By that peace the practical independence of the German princes was assured. Henceforward each prince could decide what form of religion was to be observed in his dominions. Thus Lutheranism, Calvinism and Catholicism were alike tolerated, and this recognition of the principle of compromise prepared the way for a wider toleration. Moreover, the petty principalities of the Empire, which numbered over 300, were allowed the right of concluding alliances with any foreign power, of making their own laws, and of carrying on war. Thus, in consequence of this most important concession of the emperor, the Empire lost all cohesion and became little more than a confederation. The states had firmly established their "liberties," the princes were now emancipated from imperial control, and it was evident that, unless by some means the house of Austria could re-establish its ascendancy, the eventual dissolution of the Empire must sooner or later follow. The peace of Westphalia thus marks for Europe, and in a special sense for Germany, the end of an important epoch. For Germany the changes introduced into its political life amounted to nothing less than a revolution, for there "the mainspring of the national life was broken." For Europe the Thirty Years' War brought to a close "the mighty impulses which the great movements of the Renaissance and Reformation had imparted to the aspirations" of men in all parts of the western world.

It was not, however, till the treaties of the Pyrenees (1659) and Oliva (1660) were signed that the echoes of the Thirty Years' War died away, and Europe entered upon a period in which the political ambitions of Louis XIV. threatened the interests of Europe and absorbed the attention of all European statesmen. During the intervening years from 1648 to 1659 Spain and France continued the struggle, while Charles X. of Sweden in 1654 entered upon a career of aggression and conquest in the north of Europe, which was only ended with his death on the 23rd of February 1660. Upon the balance of power in Europe the death of Charles X. had little permanent effect, and the peace of Oliva to a great extent merely marked the restoration of the status quo. But the peace of the Pyrenees was far more important. During its struggle with France, Spain found itself also involved in hostilities with England, and the real rottenness of the Spanish monarchy became rapidly apparent. Any assistance which might have been hoped for from the emperor was prevented by the formation of leagues of German princes—lay and ecclesiastical—in 1657 and 1658, which had the full support of France. The effect of the formation of the second league was at once apparent: all hope of assistance to Spain from the emperor was seen to have disappeared, and the conclusion of a pacific settlement between France and Spain was at once arrived at. The peace of the Pyrenees was a triumph for the Rieibund, no less than for France.

With the beginning of the personal rule of Louis XIV. in 1661, and the return of Charles II. to England in 1660, a new period in the history of personal monarchy in Europe began. At the same time in the Westphalia the monarchy in Europe was under a cloud. Though the death of Charles I. was lost in France the Fronde was holding its own against Mazarin; in Germany the princes had triumphed over the emperor; even in Russia the nobles were aiming at the curtailment of the power of the crown. But from 1660 it became evident that these attempts to secure the curtailment of the monarchical power were, with few exceptions, not destined to be successful. Though all chance of the establishment of a strong central authority in Germany had disappeared, the various states composing the Empire now entered upon a new period in their history and speedily formed miniature despotisms. Of these Brandenburg, Saxony and Bavaria were the most important. In Denmark Frederick III. made his crown hereditary, and his establishment of an absolutism was imitated by Charles XI. of Sweden a few years later.

Thus when Louis XIV. took into his own hands the government of France, the absolutist principle was triumphant all over Europe. The period of his personal rule lasted from 1661 to his death in 1715, and is known as "the age of Louis XIV." During that period France was the leading monarchy in Europe, and the most conspicuous not only in arms but also in all the arts of civilization. While Turenne, Luxembourg, Villars and many others exemplified, till the rise of Marlborough, the pre-eminence of French generals, Pascal, Racine, Corneille, Molière and Fenelon testified to the commanding position taken by France in the world of literature. The building of Versailles and the establishment of the French Court there was an event of importance not only in the history of France, but also in the history of Europe. The history of Europe may without exaggeration be said during the reign of Louis XIV. to centre round Versailles.
During his reign France took the lead in European politics, and established her supremacy all the more easily, owing partly to the weakness of most of the European countries, partly to the aggressions of the Turks, whose invasion of eastern Europe occupied from 1683 to 1699 the attention of the Poles and of the Austrians. The weakness or neutrality of the various European states was due to various causes. England was prevented till 1689 from taking a part in opposing the ambitious schemes of Louis XIV. owing to the personal aims of Charles II. and James II. Philip IV. and Charles II. of Spain could do nothing to resist the growing ascendancy of France, owing to the increasing weakness and rapid decadence of Spain, whose disappearance from the rank of great powers was one of the most striking features in the history of Europe during the second half of the 17th century. The weakness of Germany from the peace of Westphalia to the end of the century, due partly to the establishment of the independence of the princes of the Empire, partly to the unrest in Hungary, partly to the aggressions of the Turks, was obviously an immense gain to Louis XIV. Realizing the strength of his own position and the weakness of that of most of the European states, he entered in 1665 into the Devolution war and secured several fortresses in the Spanish Netherlands. From 1672 to 1678 he was again at war with Holland, and from 1673 with the emperor, Spain and Brandenburg as well. At the same time the Turks invaded Poland, but were successfully resisted by John Sobieski. In 1676, however, they made the favourable treaty of Zurawna, securing Kameners and portions of Podolia and the Ukraine. Thus, while the Turks were threatening the independence of eastern Europe, Louis XIV. was attacking the independence of western Europe. In 1678 he made the treaty of Nijmegen, securing great advantages for France. Till the end of the century Europe was faced with two serious problems: Could she successfully cope with the Turks on her eastern frontier? And could she resist the continued aggressions of France on her western frontier? Consequently the years from 1678 to the end of the century were of vital importance to the European world. For during that period the French and Turks made unceasing efforts to extend their frontiers at the expense of Germany. Encouraged by the weakness of the chief European states, Louis set up the Chambers of Reunion, seized Strassburg in time of peace and attempted to annex Luxemburg. At the same time it seemed that an independent Gallican Church would be set up, and that Louis, like Henry VIII., would sever all connexion with Rome. The persecution of the Jansenists and the revocation of the edict of Nantes in 1685 established something akin to religious uniformity in France. Buoyed up by his successes abroad and at home, and conscious that he had nothing to fear from England or from Spain, Louis prepared to carry out his schemes, with regard to the extension of his territory eastwards, at the expense of Germany. Simultaneously with Louis' aggressions in western Europe, the Turks had made an attempt to capture Vienna. In May 1683. Fortunately the efforts of the emperor were aided by John Sobieski, king of Poland, were successful, and the Turkish tide of conquest was gradually but successfully checked. It was not, however, till the accession of William III. to the English throne that the tide of French conquest in western Europe was in like manner successfully resisted, and it was not till the treaty of Ryswick in 1697 that Louis realized that Europe had set a limit to his conquests. That treaty inflicted a blow on the prestige of France, just as the treaty of Karlowitz, concluded in 1699, was an important step in the decline of the Ottoman power. By that treaty, which marks a definite beginning in the history of the Austro-Hungarian monarchy, the hands of the emperor were freed, and he was able to devote his attention to the Spanish succession question, which already engrossed the attention of all Europe.

The decadence of Spain had been obvious to all Europe since the middle of the century, and in anticipation of the death of the Spanish king Charles II., Louis XIV. and William III. had made a partition treaty in October 1698, which was superseded in March 1700 by a second partition treaty. However, on the death of King Charles on the 1st of November 1700 Louis repudiated the partition treaties and accepted the crown of Spain for his grandson Philip, who became Philip V. of Spain. Not content with this success Louis committed a number of aggressive acts which led to the War of the Spanish Succession in 1702. That war continued till 1713, when the treaty of Utrecht, followed in 1714 by the treaties of Rastadt and Baden, ended a struggle which had many results of vital importance to Europe. Great Britain, strengthened by the possession of Gibraltar and Minorca, by her establishment in Canada, and by trading rights in South America, henceforward stood forth as a rising colonial power to whom the command of the sea was essential. Austria obtained not only Belgium, which she held till the French Revolution, but also a firm foothold in Italy, which she maintained till 1859. To Spain the war indirectly brought unexpected benefits. Freed from her expensive possessions in Belgium and Italy, and now ruled by a new dynasty, Spain, so far from meeting with the fate which later attended Poland, entered upon a new period in her career, and throughout the 18th century showed considerable power of resistance to the colonial policy of Great Britain.

With all its defects the treaty of Utrecht proved in many ways an excellent settlement. Till 1740, although a few short wars took place, Europe as a whole enjoyed peace. But with the settlement of Utrecht Europe seemed to have lost all touch with the high ideals which occasionally, as in the career of Gustavus Adolphus, or in the English great rebellion, or in the defence of Vienna by John Sobieski, were met with. The 18th century was marked by the dominancy of a perverted system of the balance of power, which regarded such acts as the Prussian seizure of Silesia and the partition of Poland as justifiable on the ground that might is right. Before many years had passed after the treaty of Utrecht it became evident that two new nations were forming themselves into the front rank of European powers. These were Russia and Prussia. The treaty of Nystad in 1721 was to the north of Europe what the treaty of Utrecht was to the western and southern nations. It marked the decline of Sweden and the rise of Russia, which henceforth played an important part in European politics. Nevertheless till 1740 with the exception of the short Polish Succession War 1733-35 and the equally short war of 1737-39, in which Russia and Austria fought against Turkey, no general European struggle took place. That this was so was due in great measure to the alliance of 1717 between Great Britain and France, to the subsequent peace policy upheld by Walpole, Fleury, Patinio and Horn (the English, French, Spanish and Swedish ministers), to the hostility between the courts of Vienna and Madrid—only momentarily healed by the treaty of Vienna in 1725—and to the uncertain character of Russian politics.

During those years from 1713 to 1740 the great powers were slowly forming themselves into groups, bound together by the interests of the treaty of Utrecht. Spain and France after 1729 began to realize that both countries were interested in checking Great Britain's colonial developments, while Spain was also anxious to seize every opportunity of increasing her possessions in Italy at the expense of Austria.

With the year 1740 Europe entered upon a new epoch. The rivalry of Austria and Prussia for the leadership of Germany definitely began, and the struggle between Great Britain and France for supremacy in India, Canada and the West Indies entered upon a new phase. The War of the Austrian Succession (1740-48) holds therefore an important place in the history of Europe, and proved the Seven Years' War, which was practically a continuation of it, of very real interest to Europe.

In April 1748 Great Britain, France and Holland signed preliminaries of peace, which on the 18th of October became the definitive treaty of Aix-la-Chapelle. The other powers concerned agreed to the treaty with reluctance, Spain on the 20th of October, Austria on the 8th of November, and Sardinia on the
20th of November. By the terms of the peace France and Great Britain restored the conquests in America, India and Europe, which each had made from the other. As regards the other powers, the peace left serious heart-burnings. Sardinia, though gaining territory in the Milanese, was compelled to relinquish her hold on Piacentia and its territory, and to restore Finale to Genoa; Austria had to yield Parma and Piacentia to Don Philip, and to recognize the loss of Silesia to Prussia; Spain was compelled to forgo all hope of regaining Gibraltar. The importance of the terms of this treaty lies in the fact that they indicate not only the lines followed by later European settlements, but also the tendency of later European developments. To Great Britain the treaty was only a pause in her expansion in Canada and in her advance to the establishment of her influence over all India. To France the treaty was equally a presage of future disasters in India and Canada. The retention of Silesia by Prussia was a pronouncement to all Europe that a new power had arisen which was destined in 1866 to oust Austria from her dominant position in Germany. The gains won by Sardinia, too, indicated that the real danger to Austria's position in Italy would come from the house of Savoy.

The Seven Years' War (1756-63) opened with a diplomatic revolution as important as that of 1717, when France and Great Britain made an alliance. In May 1756, as a reply to the treaty of Westminster the Second, made in January between Great Britain and Prussia, France and Austria, united in the treaty of Versailles. This unexpected union, which lasted till the French Revolution, between two powers which had been hostile to each other from the beginning of the 16th century, amazed all Europe. However, it had not the results expected, for although Russia, which was allied with Austria, sent large armies headed by capable generals to the war, Frederick the Great remained unconquered. This result was partly due to the English alliance, partly to the incapable French generals, and partly to the state of internal politics in Russia. The treaties of Paris (February 10, 1763) and Hubertshurst (February 15) marked an important stage in the history of Europe. By the first Great Britain emerged from the war an imperial power with possessions all over the world, by the second Prussia was recognized as the chief power of Germany. The close of the Seven Years' War to the French Revolution saw all the special characteristics and tendencies of the 18th century in an accentuated form. Benevolent despotism found representatives not only in Frederick the Great and Maria Theresa, but also in Joseph II., Catherine II., Charles III. of Spain, and Leopold of Tuscany. Reforming ministers, too, flourished in the persons of Tanucci, Turgot, Squillaci, Florida Blanca, D'Aranda and many others. Instances, too, of the low state of political morality are to be found. The indefensible seizure of Silesia by Frederick the Great, followed in 1772 by the equally immoral partition of Poland, was followed by the chief European events during these years were (1) the partition of Poland; (2) the war of the Bavarian Succession; (3) the alliance of Russia with Prussia in 1773 and with Austria in 1781; (4) the entry of France and Spain into war between Great Britain and her American colonies; (5) the combined attack of Russia and Austria against Turkey (1787-92); (6) the Triple Alliance of 1788.

No sooner was the Seven Years' War ended than France and Spain, having made the third family compact in 1761 (the other two were signed in 1733 and 1743), prepared to take revenge upon Great Britain at the first favourable opportunity. The result of this determination, and of Great Britain's absorption in internal politics, was that Russia, Prussia and Austria were enabled to carry out the first partition of Poland in 1772. The entry of France into the American War of independence rendered it impossible for Joseph II., single-handed, to carry out his project of exchanging the Austrian Netherlands for Bavaria, and he was compelled, after a short war, to give up for the time his project and to agree to the treaty of Teschen (1779). The continuance of the American War proved of great value to Russia and enhanced her position in Europe. Not only had she, together with France, bought the treaty of Teschen, but in 1780 she headed the league of armed neutrality, and between 1780 and 1784 annexed the Crimea. The conclusion of the war of American Independence enabled Great Britain to regain her influence in Europe, and when Russia and Austria combined to attack Turkey, and when France threatened to re-establish her influence in Holland, Pitt formed with the Prussian king and the stadtholder the famous Triple Alliance of 1788. During the ensuing four years the influence of that alliance made itself felt in an unmistakable way. All hope of the establishment of French influence in Holland was destroyed; Denmark was forced to relinquish an attack on Sweden, then at war with Russia; and after Leopold of Tuscany had succeeded Joseph II. as emperor in 1790, the revolution in the Netherlands was brought to an end. Moreover, through the influence of Leopold the hostility of Prussia to Austria was removed, and the two powers in July 1790 made the treaty of Reichenbach. Great Britain, as a member of the Triple Alliance, had supported the pacific solution of all these questions relating to European peace, and Pitt was aided in his policy by the emperor Leopold, who in 1791 made the treaty of Sistova with the Turks. Danger to the peace of Europe was, however, caused by the attempt of the Spaniards to annex Nootka Sound, and by the continuance of the war between Russia and Turkey. The former difficulty was, however, removed in November 1790 by an agreement between Great Britain and Spain, and in January 1792 Russia made the treaty of Jassy with Turkey.

Instead of Europe remaining at peace the year 1792 saw the beginning of a series of wars which did not come to a final conclusion till the battle of Waterloo. While the east of Europe was engaged in war, and while the Triple Alliance was busy attempting to restore peace to Europe, the French Revolution had broken out in 1789. The assistance given by France to the American colonists had brought the country to bankruptcy, and no course was left to Louis XVI. except to summon the states-general in May 1789. In that year, with the help of Austria, he was defeated against the reforms of Joseph II. which had taken place in the Netherlands. France was soon in trouble in Poland for the overthrow of the aristocratic constitution and for the establishment of an hereditary monarchy. At first the revolution in France was entirely occupied with internal reforms, but after the dissolution of the Constituent Assembly in September 1791 the Girondists, whose influence became paramount, determined by the advice of Brissot to insist upon a policy of menace towards the Empire which would inevitably lead to war. War would, they hoped, result in the downfall of monarchy in France. On the other hand, Lafayette and his party advocated war on the ground that it would strengthen the cause of monarchy. In April 1792 war was accordingly declared upon Austria, then in alliance with Prussia. After a short period of failure the French in September won the battle of Valmy, and in November the battle of Jemappes. French armies advanced to the Rhine, Belgium was occupied, the Scheldt was declared open, and Holland was threatened. In consequence of the danger to Holland, Pitt adopted a warlike tone, and in February 1793 France declared war upon Great Britain. In that war Spain, Sardinia and Tuscany joined, so that France was practically fighting all Europe. Nevertheless, owing to the want of union among the allies, to the Polish questions which distracted Prussia and Austria, and to the determination and patriotism of all classes in France, the allies were discomfited and the league of powers broken up in 1795, when the treaties of Basel were made. Only Great Britain, Austria and Sardinia remained in arms against France, which was till 1799 ruled by the Directory. The next few years witnessed a series of most startling events. The successes of Napoleon Bonaparte in the Italian campaigns of 1797 and 1798 led to the peace of Cherasco with Sardinia,
and the peace of Campo Formio with Austria. Only Great Britain remained at war with France. In 1799, taking advantage of the absence of Napoleon in Egypt, the Second Coalition was formed by Russia, Great Britain and Austria. Though the French were driven from Italy, Massena defeated the Russians in Switzerland, and the English were forced to retire from Holland. The return of Napoleon from Egypt was followed by the establishment of the Consulate in November 1799, by the overthrow of the Austrians at Marengo and Hohenlinden, by the treaty of Lunéville with the emperor, and by the treaty of Amiens in 1802 with the English government. (See French Revolutionary Wars.)

Up to this point the Revolution may be said to have benefited Europe and to have shaken to its base the 18th-century ideas of government. During the years succeeding the peace of Campo Formio a revolution was effected in Germany. The Holy Roman Empire had become an anachronism, and as soon as France became possessed of the left bank of the Rhine it was obvious that the imperial constitution required revision. The jealousies existing among the German princes and the overthrow of Austria at Austerlitz enabled Napoleon to carry out a revolution in Germany according to his own ideas. At first, in 1804, new arrangements were made with regard to the character and formation of the diet. The constitution of that assembly was so altered that a Protestant majority free from Austrian influence was now assured. The middle states, such as Prussia, Baden, Bavaria, Württemberg and Hanover, received additions of territory, taken either from the ecclesiastical states or from the lands belonging to the imperial knights. After Austerlitz Napoleon in 1806 established the Confederation of the Rhine, and the Holy Roman Empire came finally to an end. A great European revolution had now been effected, but much remained to be done before a feeling of nationality could be aroused among the people of central Europe.

Already before the peace of Amiens Pitt had tried to stir up national feeling in Austria and Prussia, the means which he suggested for opposing Napoleon being in great measure those which were adopted in 1813 and 1814.

Napoleon's aims at the destruction of Great Britain.

The causes of Napoleon's failure. But during Pitt's lifetime central Europe was not moved by any feeling of nationality or of patriotism. During the war of the Second Coalition in 1799 Austria had acted without any regard for her allies, while Prussia, from motives of jealousy of and from want of confidence in Austria, had refused to move. It was not till the small states which hitherto had formed independent units had been destroyed and Austria and Prussia trampled under foot by Napoleon that a strong national spirit in Germany was evoked. Untill the treaty of Tilsit had been signed in 1807 there was no visible growth of a national uprising in any part of Europe. During the intervening years Prussia had been crushed at Jena and her kingdom cut short (1806), while Alexander I. of Russia, after a fierce campaign against Napoleon, had agreed in 1807 to the treaty of Tilsit, which apparently placed Europe at the feet of France and Russia. Napoleon was thus in a position to bring about the humiliation of Great Britain. Already in November 1806, realizing that he could not ruin England by direct invasion, he had issued the first Berlin Decree, which ordered the exclusion of British goods from the continent. The Continental System necessitated by the victory of Trafalgar was thus definitely set up. After Tilsit he proposed to become supreme in the Baltic, and, by securing the dependence of Spain and Portugal, to dominate the Mediterranean, and to resume his plans for conquests in the East, and for the destruction of the British power in India. Thus the effects of the British naval victories of the Nile and Trafalgar would be completely nullified, the Mediterranean would be closed to British ships, Great Britain's Indian possessions would be lost, and Great Britain herself would be forced by starvation into surrender. Fortunately for Europe various circumstances hindered the realization of these ambitious schemes. Alexander, who feared that the French emperor desired Constantinople, never proved a very helpful ally, the measures taken by Great Britain seriously interfered with Napoleon's schemes, and, before he had subdued Spain, first Austria in 1809 and then Russia in 1812 offered an active resistance to his projects. The first note of opposition to Napoleon's plans was struck by Canning, when in 1807 he carried off the Danish fleet to England. Then the British fleet conveyed to Brazil in safety the Portuguese royal family when Portugal was invaded by Junot, while the surrender of 30,000 French troops at Baylen in July 1808, which was followed in August by the convention of Cintra, indicated that Spanish patriotism was, when roused, as effective as in the days of the Spanish Succession.

Austria was the first country to follow the example of Spain, and though she was defeated at Wagram and forced to accept Napoleon's hard terms, the national feeling aroused in Germany in 1809 rapidly developed. But Napoleon was apparently unconscious of the growth and importance of a national sentiment in any of the subject countries. In 1810 he had married Marie Louise of Austria, on the 20th of March 1811 a son was born to him, and he now seems to have resolved upon the establishment of a strictly hereditary empire with Paris its capital and Rome its second city. In extent, his empire would be vaster than that of Charlemagne, and the pope was to be completely subordinate to the emperor. This conception of the establishment of a reformed Holy Roman Empire with its centre at Paris did not appear uncalculable in 1811 when everything seemed to favour the new Charlemagne. Napoleon's power was apparently securely established, and during the years 1810 and 1811 he was again returning to his vast oriental designs. A sudden check, however, was about to be placed upon his ambitious schemes.

The establishment of French influence in Italy and Germany had stirred up in both countries a national feeling, the growth of which was encouraged by the example of Spain. No greater mistake was ever made by Napoleon than when, ignoring the strength of the Spanish resistance, and the development of a national movement in Germany, he resolved to enter upon the Russian campaign and to march to Moscow. Unconsciously Napoleon "had called into vigorous life the forces of Democracy and Nationality in Germany and Italy." The failure of the Moscow campaign led at once to a national rising in Prussia, and as soon as Austria had united her forces with those of Prussia and Russia, the overthrow of Napoleon at Leipzig in October 1813 was the result, and "the imperial yoke was shaken from the neck of the German people." Napoleon's wars had roused feelings of patriotism in Italy, Germany, Russia and Spain. It was at least realized by the nations of continental Europe, what had long been apparent to Englishmen, that a nation to be strong must be united. To the "subversive cosmopolitism" of the French Revolution was now opposed the modern idea of nationality, against which the Napoleonic legions hurled themselves in vain. (See Napoleon I.; Napoleonic Campaigns; French Revolution; Alexander I., emperor of Russia; Metternich, K. K.; The triumph of "nacionality." Reconstruction of Europe.

Congress of Vienna, 1814-1815.
of the Habsburg monarchy by the French emperor: Tirol, the
Quarters of the Inn and of the Hausruck, and part of Salzburg.
But she received ample compensation elsewhere, notably
the former Bavarian Palatinate with a strip of territory to connect
it with Bavaria proper. The right to garrison the federal fortress
of Mainz was also ultimately conceded to her. Bavaria was thus
placed in a position to continue her traditional policy of aiming
at the position of a European great power and holding the
balance between Austria and Prussia (see BAVARIA: History).
The two other German states whose elevation to kingdoms
had symbolized a similar ambition, Saxony and Württemberg,
were henceforth relegated to a position of third-rate importance;
Saxony depended for her very existence on the rivalry of her
more powerful neighbours: Württemberg protested in vain
against the dictatorship of the great powers to which she was
forced to submit. Finally, the electorate of Hanover, partly
out of compliment to the king of Great Britain, partly because
with the abolition of the Holy Empire the title elector had fallen
obsolete, was elevated to a kingdom. The request of the elector
of Hesse for a similar concession in his case was refused by the
powers assembled at Aix-la-Chapelle in 1818.

Of great importance were the changes effected in the north
and east of Europe. The affairs of the Ottoman empire, which
the treaty of Bucharest (1812) between Russia and Turkey had
left in a very unsatisfactory condition, were not dealt with by
the congress, in spite of the efforts of Great Britain to bring them
to discussion. But the concessions made to the emperor
Alexander elsewhere represented a notable advance in the
European position of Russia. The possession of Finland,
conquered from the Swedes in 1808, was confirmed to her;
and, above all, the erection of the former grand-duchy of Warsaw
into a constitutional kingdom of Poland under the Russian crown
not only thrust the Muscovite power like a wedge into the heart
of Germany, but seemed to threaten the Polish possessions
of Austria and Prussia by setting up a quasi-independent Poland
as a centre of attraction to the scattered elements of the Polish
nation; though in the sequel the establishment of the city of
Warsaw and its territory as an independent republic, to avoid the
difficult question of its assignment elsewhere, proved a more
fruitful source of nationalist unrest. In the north the settlement
confirmed by the congress marked the definite withdrawal of
the Scandinavian Powers from any active influence in the affairs
of the continent. Alone of the parvenu monarchs of the
Napoleonic age Bernadotte retained the crown of Sweden, to
which, by the treaty of Kiel, that of Norway had been added.
On the other hand, by the cession of Swedish Pomerania to
Prussia, Sweden finally withdrew from the southern shores of
the Baltic. The Scandinavian states ceased henceforth to play
any determining part in European politics. In the south, on
the other hand, the restoration of Savoy and Piedmont to Victor
Emmanuel I, king of Sardinia, and the incorporation in his
dominions of the territories of the former republic of Genoa,
were factors pregnant with mighty issues. The object of this
increase of the power of the house of Savoy was but to erect a
barrier against any possible renewal of French aggression in
Italy; in effect it established the nucleus of the power which
they were to struggle successfully with Austria for the hegemony
of Italy.

The gains of Great Britain in Europe were comparatively
small, though by no means unimportant. By the retention of
Malta she secured her power in the Mediterranean, and this was
further increased by the treaty of Paris (November 5, 1815),
by which the powers recognized her protectorate over the Ionian
Islands. (See VIENNA, CONGRESS OF.)

But for the episode of the Hundred Days, France would have
emerged from the congress with recovered prestige and mistress
of at least some of the territorial gains of the revolutionary
wars; though Napoleon had thrown away, during
the negotiations at Châtillon, the chance of preserving
for her her "natural frontiers" of the Rhine, the Alps
and the Pyrenees. After Napoleon's second downfall she was in
serious danger of dismemberment, for which the German powers

interests, was hailed as the dawn of a new era. In a sense it was
so; but hardly in the manner nor to the degree that some had
hoped. In its councils the arts of the old diplomacy, still inspired
by the traditional principles or lack of principles, were directed
to the old ends; and the world, as though the popular upheaval
of the Revolution had never been, was treated as real estate
to be parcelled out by the executors of Napoleon's empire among
sovereigns by divine right, regardless of the wishes of the popula-
tions, which figured in the protocols merely as numbers to be
balanced and bartered one against the other.

This process of "dividing the spoils," as Gentz called it, was
naturally pregnant with possibilities of quarrels. Of these the
most dangerous was that provoked by the resolution of
the emperor Alexander I. at all costs to keep the former grand-duchy
of Warsaw for himself, while compensating Prussia for the loss
of some of her Polish territories by the annexation to her of all
Saxony. The deadlock caused by the stubborn insistence on
this plan, which the other great powers were equally determined
to frustrate, all but led to war, and by a secret treaty signed on
the 3rd of January, 1815, Great Britain, France, and Austria
agreed to take common cause in that event against Russia and
Prussia. It needed Napoleon's return from Elba (March 1815)
to remind the powers that their particular interests must still be
subordinated to those of Europe. The common peril restored the
broken harmony; and while the armies of the Alliance were closing
in for the final struggle with the French emperor, the
congress hurried on its deliberations, and on the 9th of June
1815, a few days before the battle of Waterloo, by which
Napoleon's power was finally shattered, the Final Act, embodying
the treaties of Vienna, was signed.

The territorial arrangements thus effected were for half a
century the basis of the states system of Europe, and the
treaties in which they were defined the charter of international
relations. It was in central Europe, where Napoleon's policy had most profoundly affected
the pre-revolutionary system, that the greatest changes
were made. No attempt, indeed, was made to restore
the Holy Roman Empire, in spite of the protest of the pope
against the failure to re-establish "the centre of political unity";
but the Confederation of the Rhine having come to an end,
Germany was reconstituted as a confederation of sovereign
states, in which all the former members of the Empire which
had survived the revolutionary epoch found a place (see
GERMANY). Austria, in virtue of the imperial tradition of the house
of Habsburg, received the presidency of the federal diet; but
the bulk of her territories lay outside the frontiers of the Con-
federation, and the non-German character of the Habsburg
monarchy was accentuated by the other arrangements at the
congress. In Italy Lombardo-Venetia was erected into a
kingdom under the Austrian crown; while the dynastic settle-
ments in the other Italian states tended to make Austrian
influence supreme in the peninsula (see ITALY). In return for
this, Austria surrendered her claim to her former possessions in
the Low Countries, which were annexed to the crown of Holland,
so as to form, under the title of the United Netherlands, an
efficient barrier to French aggression northwards. The function
of defender of Germany on the Rhine frontier which Austria thus
abandoned was assigned to Prussia, an arrangement pregnant
with momentous issues. In compensation for her disappoint-
ment in the matter of Saxony, half of which was ultimately
restored to the dynasty of Wettin, she received a large accession
of territory in the Rhine provinces, carved partly out of the
suppressed kingdom of Westphalia, partly out of the former
ecclesiastical states, and comprising the imperial city of Aix-la-
Chapelle and the former electorate of Cologne. To Prussia
also was conceded the right to garrison the federal fortress
of Luxemburg.

Of the other German states, Bavaria, which alone was suffi-
ciently powerful to be of any great importance in the general
affairs of Europe, reaped the reward of her timely defection
from the cause of her protector Napoleon. She had, indeed, to
restore to Austria the territories annexed to her at the expense

934 EUROPE [HISTORY]
EUROPE

clamoured as essential to their safety. That Louis XIV.
continued to rule over the territories “ handed down to him
by his ancestors” was due to the magnanimity, or policy, of
the emperor Alexander I. (q.v.), and the commonsense of Castlereagh
and Wellington, who saw well that the “just equilibrium,”
which it was their object to establish, could not be secured if
France were unduly weakened, and that peace could never
be preserved if the French people were left to smart under a sense
of permanent injury. By the second peace of Paris, signed on
the 20th of November 1815, France retained her traditional
boundaries. The unsatisfied ambition to secure her “national
frontiers” was to bear troublesome fruit later.

That the treaties embodied in the Final Act of Vienna
represented a settlement of all outstanding questions was believed
by nobody. They had been negotiated for weary months in an
atmosphere of diplomatic and feminine intrigue; they had been
concluded in a hurry, under the influence of the panic caused
by Napoleon’s return from Elba. To Friedrich von Gentz they were
at best but “partial arrangements,” useful as forming an
authoritative basis for the establishment of a more complete
and satisfactory system. The history of the international politics
of Europe for the years immediately succeeding the congress of
Vienna is that of the attempts to establish such a system.

After a series of attempts at alliances, conferences, etc., what
Europe needed above all things was peace and time to recoup.

This conviction was common to all the powers who had
inherited Napoleon’s dictatorship in Europe; but on
the question of the method by which peace should be
secured, and the principles which should guide their
action, a fateful divergence of view soon became
apparent within their councils. All were agreed that France still
represented the storm centre of Europe; and a second treaty,
signed on the 20th of November 1815, renewed the provisions
of the treaty of Chaumont, in view of any fresh outburst of the
French revolutionary spirit. But the new treaty went further.
By its 6th article it was declared that “in order to consolidate
the intimate tie that unites the four sovereigns for the happiness
of the world, the High Contracting Powers have agreed to renew
at fixed intervals...meetings consecrated to great common
objects and to the examination of such measures as at each of
these epochs shall be judged most salutary for the peace and
prosperity of the nations and for the maintenance of the peace of
Europe.” This was the universal guarantee of the compact
powers by which for the next seven years Europe was
welded into a concert to which the name “Holy Alliance” has been commonly
but erroneously applied. The Holy Alliance, drawn up
by the emperor Alexander I., and signed by him, the
emperor Francis, and King Frederick William III. of
Prussia on the 26th of September 1815, represented a different
and conflicting ideal. Actually it was not a treaty at all, but at best a
declaration of principles to which any Christian could subscribe, at
worst—”to quote Castlereagh—“a piece of sublime mysticism and
nonsense” from the political point of view (see Holy Alliance).
It gained its sole political importance from the persistent efforts
of the tsar and his ministers to replace the committee of the
great powers, established by the treaty of the 20th of November, by a
“universal guarantee” of all the powers, great and small, who had
signed the Holy Alliance, and thus to establish that “Confederation
of Europe” of which the autocratic idealist had borrowed
the conception from the theorists of the 18th century (see
Alexander I., emperor of Russia). It was clear from the first
that any attempt to set up such a central government of Europe
under a “universal guarantee” could only imperil the independence
of the sovereign states; and from the
first Great Britain, represented by Castlereagh,
protested against it. She would consent to take common
action on the basis of the treaties she had actually signed,
consulting with her allies on each case as it arose; but to vague
and general engagements she refused to commit herself. The
attitude of Austria and Prussia was from the outset less clear.
Metternich was torn between dread of revolution and dread
of Russia; the Holy Alliance, though essentially “verbiage,”
might be useful in holding the imperial Jacobin in check; the
“universal guarantee” could not but be discouraging to the
“sects”; on the other hand, the extreme willingness of the tsar to
march 200,000 Russians for any “European purpose in any
direction convenient or inconvenient to Austria, was—to say
the least—disconcerting. Frederick William III., on the other
hand, though he too had signed the Holy Alliance with reluctance,
in moments of panic saw in the “universal guarantee” his best
defence against the renewed attack by France which was his
nightmare. In effect, owing to the firm attitude of Castlereagh
at the congress of Aix-la-Chapelle, “the transparent soul of
the Holy Alliance” never received a body, though attempts
were subsequently made at the congresses of Troppau, Laibach
and Verona to apply some of its supposed principles—

The high-water-mark of the activity of the Allies as a central
government for Europe was reached at the congress of Aix-la-
Chapelle (q.v.) in 1818. France was now admitted to
the Alliance, the objects of which were reaffirmed by a
public declaration to which she adhered; but at the
same time a secret treaty renewed the compact
of Chaumont between the four other powers. Certain questions
were to be decided by a commission sent to Vienna, where
settlement to a ministerial conference to meet at Frankfort in
the following year. The treaty which was the result of this
conference was signed on the 20th of July 1819.
The bulk of it was concerned with territorial settlements in Germany:
between Austria and Bavaria; and Bavaria and Baden; but some of
the articles arranged for the cession of the border territories Philippe-
ville and Mariembourg to the Netherlands, defined the frontiers
of Savoy, and settled the reversion of the Italian duchies held by
the empress Marie Louise.

Meanwhile the balance of forces within the European
concert had shown a tendency to shift. At the outset the restless
activity of the emperor Alexander, his incalculable
idealism, and his hardly veiled ambitions had drawn
Austria and Great Britain together in common suspicion
of an influence that threatened to be little less disturbing
to the world’s peace than that of Napoleon. But
at Aix Metternich had begun to realize that, in the long-run,
the system of repression which he held to be essential to the
stability of the European, and above all of the Austrian, polity
was likely to lose its effective aid from Great Britain, for she,
as she was by constitutional forms; while Alexander, alarmed at the
discovery of revolutionary plots against his person, had
already shown gratifying signs of repentance. The “Jacobin”
propaganda of the tsar’s agents continued, it is true, especially
in Italy; and, in spite of the murder of the dramatist Kotzebue,
as a Russian emissary, by the fanatical “Bursche” Karl Sand,
Alexander joined with Castlereagh in protesting against the
reactionary policy embodied in the Carlsbad Decrees of October
1819. But the murder of the duke of Berri on the 13th of
February 1820 completed the Russian autocrat’s “conversion.”

At the congress of Troppau, which met in the autumn of the same
year, he was a “changed man,” committed henceforth heart
and soul to Metternich and his policy. The outcome of this new
understanding was the famous Troppau Protocol, published
on the world on the 10th of November 1820, and signed by Austria, Prussia and Russia. The
immediate occasion of this manifesto was the military
insurrection, under General Pepe, at Naples, by which
the Spanish constitution of 1812, which had been
the king’s special pride: His Protocols. But the protocol embodied a general
principle involving issues infinitely more important than any arising out of this particular question. “States which have
undergone a change of government due to revolution,
declared,” “the results of which threaten other states, ipso facto
cannot be members of the European alliance, and remain
excluded from it till their situation gives guarantees for legal
order and stability. If, owing to such alterations, immediate
danger threatens other states, the powers bind themselves, by
peaceful means, or if need be by arms, to bring back the guilty state into the bosom of the Great Alliance.

This was, in effect, an attempt to apply the principle of the Carlsbad Decrees to all the world; and, had the attempt succeeded, all Europe would have been turned into a confederation on the model of that of Germany; for a political alliance, charged with the safeguarding of the territorial settlement defined by treaty, would have been substituted a central diet of the great powers, armed with undefined authority; and the sovereign independence of the nations would have been at an end. To any such principle, and therefore to the protocol in which it was embodied, Great Britain offered a uncompromising opposition. In vain Metternich urged upon Castlereagh that the protocol was but the logical conclusion drawn from premises to which he was already committed; for, if the alliance was to be effective in maintaining peace, it must interfere wherever and whenever peace should be threatened, and therefore to crush internal revolutions which could not but have an external result.

The logic was perfect; the proposition that on which every "project of peace" must eventually break. Castlereagh's reply was, in brief, that Great Britain could never admit a principle which she would not in any circumstances allow to be applied in her own case.

The absence of the signatures of Great Britain and France from the Troppau protocol marked the first rift in the alliance, a rift that was soon to develop into a breach. For the time, indeed, the crack was "papered over." Castlereagh was prepared to leave Austria a free hand to deal with the rising in Naples and Piedmont, since she had treaty rights in the former case and her interests, as an Italian power, were threatened in both. Great Britain was even represented at the congress which reassembled at Laibach in January 1821, though Lord Stewart, the ambassador at Vienna, was not armed with full powers. Castlereagh had approved of the invitation sent to the king of Naples to attend the congress, as implying "negotiation" and an improvement on the dictatorial attitude of the protocol.

But everything in the conferences tended still further to shatter the unstable foundations of the alliance. Capo d'Istria, as though the debates of Aix-la-Chapelle had never been, raised once more the spectre of the "Universal Union" which Castlereagh believed he had laid for ever. Metternich, anxious to prove to the Italian Liberals that the tsar was no longer their friend, welcomed the demonstration, and Prussia followed obediently in Austria's wake. "It is clear," wrote Lord Stewart, "that a Triple Understanding has been created which binds the parties to carry forward their own views in spite of any difference of opinion which may exist between them and the two great constitutional governments." (See TROPPAU AND LAIBACH.)

But the narrower "Holy Alliance" of the three autocratic monarchies, as opposed to the two western constitutional monarchies, was not in fact "papered over" till after the Paris revolution of 1830. Several factors delayed the process, notably the revolt of the Greeks against the Ottoman rule, and the Spanish question, which latter formed the main subject of discussion at the congress of Verona in 1822. In the Eastern Question the interests of Austria and Great Britain were identical; both desired to maintain the integrity of Turkey; but both saw that this integrity was in the greatest peril owing to the possible intervention of the Orthodox tsar in favour of his co-religionists in revolt; and both agreed that the best means of preventing such intervention was to bind the Russian emperor to the European concert by using his devotion to the principles of the Holy Alliance. At Verona, however, the Eastern question was entirely overshadowed by that of Spain, and in this matter the views of Great Britain were diametrically opposed to those of the other powers of the alliance. She shared indeed with France and Austria the strenuous objection to the emperor Alexander's proposal to march 150,000 Russians into Piedmont in order to deal with Jacobinism whether in France or Spain; but she protested equally strenuously against the counter-proposal of France, which was ultimately adopted, that a French army should march into Spain to liberate the king from his constitutional fetters in the name of Europe. George Canning, carrying on the tradition of Castlereagh, once more protested, through Wellington, as British plenipotentiary at the congress, against the whole principle of intervention; and when, in spite of the British protest, the other powers persisted, the breach of Great Britain with the continental alliance was proclaimed to all the world. When, on the 7th of April 1823, the French army under the duke of Angoulême crossed the Bidassoa, the great experiment of governing Europe through a central committee of the great powers was at an end. (See VERONA, CONGRESS OF; ALEXANDER I.; LONDON DERRY, ROBERT STEWART, 2nd marquess of; CANNING, GEORGE.)

Henceforth, though the treaties survived, and with them the principle of the concert on which they were based, "Europe" as a diplomatic conception tends to sink into the background and to be replaced by the old international anarchy of the 18th century. To Canning this development seemed wholly welcome. He applied to the rivalry of states the Liberal principle of free competition as the sole condition of healthy growth. "Villiers is a minister of thirty years ago," he wrote to Bagot on the 3rd of January 1823, "no revolutionary soundberr: but constitutionally hating England, as Choseul and Vergennes used to hate us, and so things are getting back to a wholesome state again. Every nation for itself, and God for us all." But the essential difference between the rivalries of the 18th and 19th centuries was in the conception of the "nation." To Canning, as to the diplomatists of the congress of Vienna, "nation" was synonymous with "state," and national boundaries were those defined by the treaties, which Canning was as bent on preserving as any of his reactionary contemporaries. The conception of the divine right of every nationality to readjust political frontiers to suit its "national" ideals was, as foreign to him as to Metternich. Yet this principle, which was destined during the 19th century to wreck the political structure consecrated at Vienna, and to leave to the succeeding age a host of unsolved and insoluble problems, found in Canning its earliest champion in the higher councils of Europe. The recognition of the independence of the South American republics and of the belligerent rights of the Greek insurgents were both in the first instance motivated by the particular interests of Great Britain; but they were none the less hailed as concessions to the principles of nationalitiy, to which they gave an impetus which was destined to continue till the face of Europe had been transformed.

This in fact constitutes the main significance for Europe of the War of Greek Independence, which lasted from the first rising of the Greeks in the Morea in 1821 till the signature of the treaty of London on the 7th of May 1832 (see GREEK INDEPENDENCE, WAR OF; TURKEY: HISTORY). As far as the political structure of Europe was concerned, was enlarged by the insignificant kingdom to the European states system. But its moral effect was immense. The sacrosanctity of the status quo had been violated, and violated with the active aid of three of the powers of the continental alliance: Russia, France and Great Britain. Metternich was right when he said that, in principle, there was no difference between the Greek insurgents and any other "rebels against legitimate authority," and the Liberals of all Europe, forced into inactivity by the Austrian police system, hailed in the Greeks the champions of their own cause. Philhellenism, beyond its proper enthusiasm, served as a convenient veil for agitations that had little concern with Greece. Other forces making for political change were simultaneously at work. The peace secured by the concert of the powers had given free play to the mechanical and industrial innovations that heralded the marvelous economic revolution of the coming age; wealth increased rapidly, and with it the influence and the ambition of the middle classes. The revolution of July 1830, which established the bourgeois monarchy in France, marked their first triumph.
countries less economically advanced, e.g. Germany and Italy; the attempt to follow French example ended in failure; but the revolt of the Belgians, for reasons partly economic and partly national, against the domination of the Dutch, resulted in the establishment of the independent kingdom of Belgium—the first actual breach in the territorial settlement of 1815. In Great Britain the agitation of the disfranchised middle classes, which seemed to threaten a violent revolution, ended in 1832 in the passing of the Reform Bill and their admission to political power. (See France; Germany; Italy; Belgium; English History.)

The easy success of the revolutions in the west of Europe had been due, not to any reluctance of the reactionary powers to interfere on the basis of the old agreements, but to their preoccupation with the national revolt in Poland (q.v.). In view of this, and of the attitude of Great Britain, they had to recognize the title of Louis Philippe as king of the French, merely stipulating that he should guarantee to maintain the treaties. In spite of the overthrow of the legitimate dynasty in France, and of the partition of the kingdom of the Netherlands, the territorial settlement of Vienna remained, after the revolution of 1830, substantially intact. Outside the limits of the treaties, however, withdrawal by the way of occupation from Spain was determined, broadly speaking, by the two main questions that dominated international politics between the years 1831 and 1843: (1) the antagonism between the western constitutional powers, France and Great Britain, and the eastern autocratic powers, Russia, Austria and Prussia; and (2) the crisis in the Eastern question resulting from the revolt of Mehemet Ali, pasha of Egypt, against the Porte. The strained relations between Great Britain and France, resulting from the French policy of aggression in the Spanish peninsula, which had more than once brought the two powers to the verge of war, had been eased before the fall of the government of Charles X. The peril of a French hegemony over the vast colonial empire of Spain had been forestalled by Canning's recognition of the independence of the South American republics; the intrigues of France in favour of the partisans of Dom Miguel in Portugal had been checkmated by a political breach, on behalf of the Portuguese Liberals, of the British principle of non-intervention, and finally the chief cause of offence had been removed, in 1827, by the withdrawal of the French army of occupation from Spain. In the Greek question the two powers had acted cordially in concert; and this good understanding even the French conquest of Algiers in 1830, which laid the foundations of the French empire in Africa, had not availed to shatter; for the eyes of the Tory ministry were still fixed on France as the potential focus of revolutionary propaganda, and any over-sea possessions she might acquire were, in Wellington's opinion, so many hostages for her good behaviour given to British sea-power. The results of the July revolution in Paris were accepted by Great Britain so soon as it became clear that Louis Philippe stood for peace and not for revolutionary aggression; the armed intervention of France in favour of the Belgians in August 1831 was stopped by the firm language of Palmerston; the French occupation of Ancona, as a countermove to Austrian aggressions in Italy, was accepted as "an incident of the balance of power"; and the intention of the king of the French to abide by the treaties, which became clearer with the consolidation of his power at home, paved the way for that entente between the two Liberal powers which lasted until 1840.

*The constitutional v. the autocratic powers.* During the Greek revolt the efforts of Austria had been directed to preventing a Russian attack upon Turkey; these efforts had failed, and Metternich's worst fears seemed to be realized when the Russo-Turkish campaigns of 1828-29 issued in the treaty of Adrianople (September 1829), and the apparently complete vassalage of the sultan to the tsar. But when, in 1832, Sultan Mahmud appealed in his despair to the emperor Nicholas to save him from ruin at the hands of the Egyptian rebels, and, as the result, the treaty of Unkiai Skelési (July 8, 1833) seemed to place definitely in the hands of Russia the keys of the Black Sea, it was left to France and Great Britain to give voice to the protest of Europe. Austria, alarmed by the revolutionary movements of 1830, accepted the fact of Russian preponderance at Constantinople, rather than risk a breach with the autocrat who was now the main pillar of the Holy Alliance. The emperor Nicholas, for his part, was equally prepared to surrender some of his ambitions in the East for the sake of the common cause, the more so since to Russian statesmen the maintenance of Turkey in a condition of weakness and dependence now seemed preferable to any attempt to break it up. The result of these dispositions was the convention of Münchengratz (September 18, 1833) between Russia, Austria and Prussia, by which the three powers undertook to maintain the integrity of the Turkish empire. On the following month, a secret convention was signed at Berlin between the same powers (October 15), reaffirming the right of the powers to intervene in the internal affairs of a friendly state at the request of its legitimate sovereign, a right with which no third power would be allowed to interfere, such interference to be regarded by the three powers as an act of hostility directed against all of them.

This reconstitution of the "Holy Alliance" on a narrower basis was the work of the emperor Nicholas, whose masterful personality had by this time quite overshadowed the influence of Metternich in the councils of the autocratic powers. There was no formal breach of the Grand Alliance; the "treaties" remained in force; but the French revolution of 1830 had produced a practical disruption which was every day accentuated by the attitude of the British government under the influence of Palmerston. For Palmerston had now become "the floribund of Europe," openly proclaiming his contempt for international law and equally openly posing as the protector of "oppressed nationalities." In these two words "France and England," wrote then to King Frederick William of Prussia, "have the courage to profess boldly rebellion and the overturn of all stability, we ought to have the right and the courage to support Divine right." This deep cleavage of principles was immediately exhibited in the attitude of the powers towards the troubles in the Spanish peninsula. In September 1833 Ferdinand VII. of Spain died, and, under the Pragmatic Sanction, his daughter Isabella succeeded under the regency of Queen Christina; in July, Don Miguel, the absolutist pretender to the throne of Portugal, had made himself master of Lisbon. In Spain Don Carlos, Ferdinand's brother, claimed the crown as the legitimate heir, and began the long agony of the Carlist war; in Portugal the constitutionalists upheld in arms the rights of Queen Maria da Gloria (see Spain and Portugal). Carlists and Miguelists, making common cause, had the moral support of the allies of Münchengrätz; while France and Great Britain took the side of the Liberals. A formal alliance between the two western powers, proposed by Talleyrand, was indeed refused by Palmerston, who, being wise to commit Great Britain to an irrevocable breach with Austria and Russia, and was suspicious of the ambitions of France in Spain; but ultimately a triple alliance between Great Britain, Spain and Portugal—with the object of restoring order in the peninsula—was converted, under pressure from the French government into the Quadruple Alliance of the 22nd of April 1834.

The *entente* implied by this formal instrument was, however, more apparent than real. When, in the spring of 1835, Queen Christina applied to the Allies for help against a renewed Carlist rising, Palmerston's suspicions were again aroused by
The somewhat naïve suggestion of Thiers that France should once more intervene as in 1833, a suggestion that was firmly rejected. Palmerston’s counter-proposal of an English expedition met with as little favour in Paris. The Anglo-French entendre was proving but a “cardboard alliance,” as Wellington called it; and the emperor Nicholas, to whom the existence of Louis Philippe as king of the French was at once a sacrifice and a menace, began with a good hope to work for its destruction. The fears roused by the Reform Act of 1832 had been belied by its results; the conservative temper of the British electorate had restored to Great Britain the prestige of a legitimate power; and the pledge of the tsar’s renewed confidence and goodwill was the visit of the cesarevich (afterwards the emperor Alexander II.) to the English court in 1839. This was not without its effect on the public sentiment; but the triumph of the tsar’s diplomacy was due to fresh complications in the Eastern question, and to the renewed effort of Sultan Mahmoud to crush the hated viceroy of Egypt. These events will be found outlined in the article МЕРВЕТ АЛІ. Here it will suffice to say that the convention of London of the 15th of July 1840, signed by Great Britain, Austria, Prussia and Russia without calling France into counsel, marked the definite breach of the Anglo-French entendre, a breach which was but imperfectly healed by the Straits’ Convention signed by all the powers on the 13th of July 1841.

The Straits’ Convention was hailed by Count Nesselrode, the Russian foreign secretary, as having re-established “the federalist system of the European states on its old basis.” This was true, in so far as it created yet another precedent for the concerted action of the European powers, and once more consecrated the right of “Europe” to decide in common on questions of first-rate international importance. But the divergence of interests and principles within the concert were too great to be healed by the settlement of a single issue, however important, and this divergence increased as events moved towards the revolutionary outbreaks of 1848. When, in 1846, the independent republic of Cracow was suppressed by agreement of the three autocratic powers, on the ground that it had become a dangerous centre of revolutionary agitation, it was Great Britain and France that protested against an arbitrary infraction of the treaties by the very governments which had laid the greatest stress upon their sanctity. The entendre between the two Liberal powers had been patched up after the closure of the Egyptian Question; it was cemented by visits of Queen Victoria and the prince consort to the Charterhouse of Europe (1845 and 1846) and by the visit of King Louis Philippe to Windsor (1844); and it survived, in spite of several causes of friction, notably the crisis in Morocco (q.e.), until 1846, when the affair of the Spanish Marriages brought it to a somewhat dramatic conclusion.

The attempt to secure the succession to the Spanish throne for his descendants by pressing on the marriage of the duke of Montpensier with the infanta Luisa, before that of the young queen Isabella had been proved to be fruitful in children, was on the part of Louis Philippe more than a breach of faith with Great Britain (how deeply it was resented may be learnt from Queen Victoria’s letters); it was a breach of faith with the revolution that had made him king. Since 1840, indeed, the whole trend of the king’s policy had been to revert to the traditional standpoint of the Bourbons; internally, “resistance” to the growing claims of the democracy; externally, dynastic ambition. But in endeavouring to win the goodwill of the reactionary powers he succeeded only in losing that of the classes of his own people on which his authority was based. In 1847 he joined with the three autocratic powers in supporting the clerical and reactionary Sonderbund in Switzerland, in defiance of the protests of Great Britain and the attitude of the majority of Frenchmen. When, in February 1848, the revolution broke out in Paris, the bourgeois monarchy, utterly discredited, fell without a struggle (see France and Louis Philippe).

The revolution in Paris was not the cause of the political upheaval which in the year 1848 convulsed Europe from Ireland to the banks of the Danube; it had indeed been preceded by the triumph of Liberalism in Switzerland, by successful revolutions in Naples and Palermo, and by the grant of a constitution in Piedmont; but flaring up as it were in the revolutionary centre of Europe, it acted as the beacon signal for the simultaneous outbreak of movements which, though long prepared, might but for this have been detached and spasmodic. It was this simultaneity which gave to the revolutions of 1848 their European character and their formidable force. They were the outcome of various, dissimilar and sometimes contradictory impulses—political, social, racial. In France the issue resolved itself into a struggle between the new working-class ideal of Socialism and the bourgeois ideal of the great Revolution; in England the Chartist movement presented, in a less degree, the same character; in Germany, in the Austrian empire, in Italy, on the other hand, the dominant motives were constitutional and nationalist, and of these two the latter became in the end the determining factor. The events of the different revolutions are described elsewhere (see France; Austria; Germany; Hungary; Italy). From the point of view of Europe such unity as they possessed was due to their being, so far as Central Europe was concerned, directed against the system of “stability” associated with the name of Metternich. In hatred of this system, German, Czech, Magyar, and Italian were united; Kossuth’s great speech of the 3rd of March echoed far beyond the frontiers of Hungary; the fall of Metternich (March 13) was a victory, not only for the populace of Vienna, but for all the peoples and races which had worn the Austrian fetters. It was the signal for revolutions in Hungary (the passing of the “March Laws”), in Bohemia, in Prussia (March 15), in Milan; on the 23rd of March, Charles Albert of Sardinia, placing himself at the head of the Italian national movement, declared war against Austria. Against a movement so widespread and apparently inspired by a common purpose the governments were powerless. The collapse of the Austrian administration, of which the inherent rottenness was now revealed, involved that of those reactionary powers which had leaned upon it. One by one they accepted what seemed to be inevitable; even Pope Pius IX. sent troops to fight under the banner of St Peter for the Italian cause; while in Berlin Frederick William IV., wrapped in the gold and black colours of imperial Germany, posed as the leader of “the glorious German revolution.” When, on the 18th of May, the parliament of United Germany was opened at Frankfort, it seemed as though Germany was to have its own revolution. The collapse came in Italy, early in the same month, Lombardy, Modena, Parma and Piacenza declared by plebiscites for incorporation in the north Italian kingdom, Venice following suit on the 4th of June. A profound modification of the European states system seemed inevitable.

That, in the event, the revolutions of 1848 left the territorial settlement of Vienna intact, was due in the main to the marvellous resisting power of the Habsburg monarchy, the strength of which lay in the traditional loyalty of the army and the traditional policy of balancing race against race within the empire. The triumph of democracy in Germany was made possible only by the temporary collapse of the Habsburg power, a collapse due to the universality and apparent unanimity of the onslaught upon it. But it was soon clear that the unanimity was more apparent than real. The victory of the democratic forces had been too easy, too seemingly overwhelming; the establishment of the constitutional principle in the main centres of autocracy seemed to make common action against the powers of reaction of secondary importance, and free play was allowed to Gestapo and national antagonisms that had been present from the first.

The battle of German, as well as of Italian, liberty was being fought out on the plains of Lombardy; yet the German democrats, whether in Vienna or Frankfort, hailed the victories of the veteran Radetzky as triumphs of Germanism. In Bohemia the
revolutions was wrecked on the rivalry of German and Czech; and when the Hungarians drew the sword against Austria, the imperial government was reinforced by the hatred of the southern Slavs for their Magyar task-masters.

Thus, from the chaos of warring races, the old order began slowly to reappear. So early as the 15th of June 1848 Prince Windischgrätz had restored order in Prague and received the thanks of the Frankfort parliament; on the 25th of July Radetzky's victory at Custozza set free the imperialist army in Italy; on the 4th of September Jellachich, ban of Croatia, invaded Hungary in the name of the united empire; on the 1st of November Windischgrätz entered democratic Vienna. The alliance of the army and the Slav races had won the victory over German democracy. The combating of Hungarian nationalism proved a longer and a harder task; but the Austrian victory of Kapola (February 26–27, 1849) encouraged Schwarzenberg to dissolve the rump of the Reichsrath at Kremsier and proclaim a new constitution for the whole empire, including Hungary. The Magyar victories that followed issued in the proclamation, on the 14th of April, of the independence of Hungary. But though the Austrian arms had not been strong enough to crush the Hungarian revolt, they had proved at any rate the efficacy of the conservative principle. The emperor Nicholas I of Russia had watched in disgusted silence the weak spirit of concession with which the revolutions had been everywhere met; so long as the sovereigns seemed to forget their divine mission he had held rigorously aloof, and had only broken silence to congratulate Windischgrätz on his capture of Vienna and Schwarzenberg on his reassertion of vigorous principles. Now, however, that Divine Right was in arms against the forces of disorder, he was prepared to listen to the prayer of the emperor Francis Joseph for assistance against the Hungarian rebels. The engagements of 1833 were remembered; and in the brotherly spirit of the Holy Alliance, Hungary was subdued by Russian armies and handed over, without quid pro quo, to her legitimate king.

Görgei's capitulation of Villágos (August 14, 1849) cleared the ground for the complete restoration of the system destroyed by the March revolutions of the year before. The refusal of Frederick William IV of Prussia to accept the imperial crown (April 21, 1849) had already advertised that there would be no third Bonapartist movement in Germany; and Prussia, her military prestige restored, stood once more face to face with Austria in rivalry for the hegemony of Germany. In the diplomatic contest that followed Prussia was worsted, her claims to an independent supremacy in the north were defeated, and the convention of Olmütz (November 29, 1850) restored the status quo of the Confederation as established in 1815.

Within three years of the great upheaval of 1848 the forces of revolution seemed everywhere to have been subdued, the states system of Europe to have been re-established on the basis of the treaties of Vienna. In reality, however, this restoration was only on the surface; the cracks in the structure of the European system had—to use Bismarck's phrase applied to another occasion—only been "papered over"; and soon ominous rents revealed the fact that the forces that had threatened it with sudden ruin were still at work. One fateful breach in the treaties had, indeed, been accepted as beyond repair; when the dust of the revolution was settled, the Napoleonic movement firmly seated on the throne of France. The emperor Nicholas, watching from the calm of Russia, had realized all that the recognition of this fact would involve; he had proposed to set in motion the somewhat rusty machinery of the Grand Alliance, but the other autocratic powers were in no case to support a legitimist crusade, and when Napoleon in 1852 assumed the title of emperor, all Europe recognized his right to do so, even Nicholas being faint to content himself with refusing to treat the parvenu monarch as his "brother," and to admit his style of "third" Napoleon, which seemed to imply a dynastic claim. Napoleon, indeed, was accepted by the powers, as he was wel-

companied by the French people, as the "saviour of society" from the newly revealed perils of the social revolution. For new and ominous forces had made their appearance since the revolution of 1830 had established the middle classes in power. The industrial development had proceeded in the west of Europe with astonishing rapidity, with its resulting concentration of vast populations in factories and factory cities; and this "proletariat," excluded from any voice in the government, and exposed in accordance with the prevailing economic theories of doctrinaire Liberalism to the horrors of unrestricted competition, had begun to organize itself in a movement, of which the catchword was "the right to work" and the banner the red flag of the socialist commune. The reign of Charles X. had been the reductio ad absurdum of the principle of legitimacy; that of Louis Philippe had discredited for ever government based solely on the bourgeoisie; the socialistic experiments of 1848 in Paris had collapsed amid the anarchy and bloodshed of the June days. At this opportune moment Louis Napoleon Bonaparte proclaimed to the French people the "Napoleonic Idea" as conceived by himself. The great Napoleon had been the incarnation of the revolution; the Bonaparte, had sprung armed from the revolution itself. "Minerva from the head of Jupiter," he had ruled because to him the people, by whom the Revolution had been made, had delegated the duty of representing, protecting and guiding it. Of this idea Louis Napoleon conceived himself to be the heir; and when by a double plebiscite the French nation had established him in supreme power, first as president for life (1851), then as emperor (1852), he was able to claim that he represented the people in a far more immediate sense than could be asserted of the chance majority of any representative assembly.

It was clear that, sooner or later, Napoleon III. would prove a disturbing force in Europe. His title to rule was that he represented France; it followed therefore that he must be hostile to "the treaties," by which the traditional aspirations of France, e.g. for her "natural boundaries" of Rhine, Alps and Pyrenees, were restrained. He reigned as "emperor of the French"; it followed that he represented that principle of nationality which the treaties ignored. He could not afford—as Metternich had said of the Revolution—"to reign like Minerva from the head of Jupiter"; and any activity he might display would be felt certainly at the expense of the established order. At the outset, indeed, it was his policy to pose as its custodian. To reconcile the French clericals he supported the pope against the Italian Liberals; but otherwise he proclaimed aloud his devotion to the arts of peace. A period of rapid material expansion succeeded the unrest of the revolutionary years; engineers and men of science were quickly producing a change in all the material conditions of life, greater than could have been effected by any political revolution; especially the face of Europe was gradually being covered with a network of railways, which it was hoped would draw the European nations not only materially but morally closer together. The first universal exhibition, opened under the auspices of the prince consort at London in 1851, was intended to advertise and consecrate the dawn of a new era of international peace and goodwill. The Crystal Palace at Sydenham, once hailed as the "bright Koh-i-nur of the West," remains the dim monument of a hope so soon to be belied by the hard logic of events. For no period in 1851 has been so occupied with wars and the rumours of war as the twenty years that followed the opening of this great temple of peace.

One question, that of the ultimate destination of the duchies of Schleswig and Holstein, which threatened the tranquillity of the West, was temporarily settled by the conference of London in 1852 (see SCHLESWIG-HOLSTEIN QUESTION). But about the same time anxious watchers noticed on the political horizon in the East a cloud, no bigger than a man's hand, that threatened a serious storm. At this first this was no more than a quarrel between Greek and Latin monks about the custody of certain holy places and things in Palestine.
It soon, however, became clear that behind these insignificant combats loomed the figures of the emperors of Russia and France. The motives that induced Napoleon to take up the cause of the rights of the Latin church in this matter were partly political, partly personal. He resented the tsar’s attitude towards himself; he wished to gain the firm support of the clergy for his throne; he desired to win prestige for himself and his dynasty by reasserting the traditional influence of France in the Ottoman empire. The events that led up to the Crimean War, and those of the war itself, are told elsewhere (see CRIMEAN WAR). Great Britain had been drawn into the war by her traditional policy of preserving the Ottoman empire as a barrier against the advance of Russia to the Mediterranean and the consequent danger to the British empire in India. It is now generally conceded that, so far as these objects were concerned, the war was a tragic mistake. The hopes that were built on the capacity of Turkey to reform itself were disappointed; the restrictions imposed upon Russia were repudiated at the first opportunity, during the Franco-German War in 1870; and the results of the Russo-Turkish War of 1876 have shown that a far more effective barrier against Russia than the weakened Ottoman empire has been furnished by the young and vigorous national states of the Balkan Peninsulas. None of the limitations imposed by the Congress of Vienna, by which the Congress was closed, marks an important epoch in the diplomatic history of Europe; and it is impossible to say that the blood spilled in the Crimean War was wholly wasted. At the time the main success of the allied powers seemed to be in the thrusting back of Russia from the Danube by the cession of Bessarabia, the extinction of Russian sea-power in the Black Sea, the formal repudiation of the tsar’s claim to a special right of interference in Turkey. But the true significance of the work of the congress of Paris lies in the impetus given by it to the development of an effective international law. The concert of Europe was consecrated anew by the solemn admission of the Ottoman empire to an equality of status with the European powers and the declaration of the collective obligations of Europe towards it. The Congress, moreover, acted in some sort as the legislative body of Europe; it established the principle of the free navigation of the Danube and of the right of all nations to carry their commerce into the Black Sea; by a declaration, signed by all the powers present, it abolished the practice of granting letters of marque to privateers in war time. The question was even discussed of establishing some sort of a tribunal to settle the rules of international law agreed upon should be enforced upon recalcitrant states; and, though nothing was settled, a new to this effect was entered upon the protocol. The congress of Paris thus set a precedent more hopeful than those of the congresses held earlier in the century, because the issues were not confused by the supposed necessity for upholding “legitimacy” at all costs; it was a stage in the progress from the ideals of the Grand Alliance to those of the Hague Conference.

The conclusion of the Crimean War left the emperor Napoleon the most influential personage in Europe; and Paris, the seat of the congress, became also the centre of the diplomatic world. Russia had been blest almost to death by the war; Austria was discredited and isolated owing to the dubious part she had played in it; Prussia had not recovered from the humiliation of Olmütz; Great Britain was soon plunged into the critical struggle of the Indian Mutiny. The time was obviously opportune for the realization of some of the aspirations implied in the Napoleonic idea. The opportunity came from the side of Italy. But clothing Napoleon and Italy. War of 1859, Napoleon and France. Congress of Paris, 1856.

was the beginning of a process which, within twelve years, was to change the balance of Europe. It was ominous of the future that it was largely the menace of Prussian intervention that persuaded Napoleon to conclude the armistice of Villafranca (July 29, 1859), by which contrary to his agreement with Victor Emmanuel, left Venice to the Austrians. In spite of the peace of Zürich (November 10), indeed, the union of Italy continued during the succeeding years, and Savoy and Nice were the reward of the French emperor’s connoissance (see ITALY). France thus once more gained her “natural frontier” of the Alps; the question was whether she would be able to regain her other natural frontier on the Rhine. The times were not propitious for an enterprise which was undoubtedly one of the main objects of Napoleon’s policy. The European concert had ceased to exist as an effective force; the treaties had been violated with impunity; in Germany, where the tension between the two great powers had not been eased by Prussia’s dubious attitude during the war, there was little prospect of a united opposition to French aggression, and the conditions seemed highly favourable for reviving the traditional policy of exploiting German disunion for the aggrandizement of France. Prussia was arming, but her armaments were directed not against Napoleon but against Austria; and the beginning of the reign of William I, who had been crowned in 1861, promised the development of a situation in which the French emperor would once again become the arbiter of Germany. On the 29th of March 1862 Prussia signed a commercial treaty with France on a basis that involved the exclusion of Austria from the Zollverein, and replied to the protests of the court of Vienna by recognizing the new kingdom of Italy. In September of the same year King William placed the supreme direction of Prussian policy in the hands of Otto von Bismarck, whose views on the exclusion of Austria from Germany were known to all the world.

The outcome of the Polish insurrection of 1863, however, altered the aspect of things, and in a direction unfavourable to France (see POLAND: HISTORY). Napoleon had been forced by French public opinion to come forward as the protector of the Poles; but the spectacle of a Bonaparte posing as the champion of “the treaties” was not impressive; his brave words were not translated into action; and he only succeeded in offending Russia by his protests and alienating Great Britain by his overtures. The peace of Pressburg, which, as far as Austria and Great Britain was rejected in a note of Prince Gorchakov, to Baron Brunnow, the Russian ambassador in London (July 1, 1867); no action followed; and the last effort to put forward the treaties of Vienna as the common law of Europe ended in a fiasco. British ministers, who had been made to look somewhat ridiculous, henceforth begun to be chary of active intervention in continental affairs; Austria and France were alike discredited and isolated. Prussia, which, under Bismarck’s auspices, had aided Russia in suppressing the Poles (convention of February 8, 1863) alone emerged from the crisis with increased prestige. Bismarck, indeed, was too wary to accept the tsar’s suggestion of an offensive alliance and an immediate combined attack on Austria and France; but in the coming struggle for the hegemony of Germany he was assured at least of Russia’s neutrality.

The final act in this long rivalry began with the opening up of the Schleswig-Holstein question on the death of Frederick VII of Denmark and the accession of the protocol king Christian IX. (November 15, 1863). The German states, claiming to the duchies, the Danish claimants, at least Schleswig and Holstein, with the duchy of northern Germany, were but subordinate issues of questions far more fateful, the developments of which once more illustrates the hopeless enfeebled of the idea of the European concert. In the struggle for the possession of the duchies the general sentiment of Germany was on one side, that of Europe on the other. By the protocol of 1852 the duchies had been treated as an integral part of Denmark, and France and Great Britain, as signatory powers, alike protested against the action
of Austria and Prussia in asserting the German claim by force of arms. But as in the case of Poland, protests were not followed by action; Napoleon in the end contented himself with proposing his favourite “Napoleonic idea” of a plebiscite, to discover the wishes of the populations concerned; Palmerston, who realised some of the important issues involved, allowed his warlike attitude, under exalted influences, to evaporate in words. Thus Great Britain earned the lasting resentment of Germans, without succeeding in preventing the establishment of German sea-power in the Baltic. For the Prussian war-harbour of Kiel and the Kiel canal were in Bismarck’s mind from the outset. Throughout he intended to make the duchy a part of Prussia and to use the whole question as a means for the solution of that of Germany. The Austro-Prussian War of 1866 grew inevitably out of the Dano-German War of 1864; and the treaty of Prague (Aug. 23, 1866), which excluded Austria from Germany and established the North German Confederation under the headship of Prussia, not only absorbed into Prussia the North German states which had sided with Austria, but by the annexation to her of Schleswig and Holstein laid the foundations of German power in the North Sea, and of German rivalry with England in the future.

More immediate were the effects of the campaign of Königgrätz on France. The rapid and overwhelming victory of Prussia overthrew all the calculations of Napoleon, who had looked to intervening as arbiter between exhausted combatants. The sudden menace of the new German power alarmed him, and he sought to secure the Rhine frontier for France, by negotiations with Prussia, in the form of “compensations” at the expense of the South German states. He succeeded only in placing a fresh weapon in Bismarck’s hands. The communication of the French overtures to the South German courts was enough to throw them into the arms of Prussia; and treaties of offensive and defensive alliance were signed in August 1866 between Prussia and Württemberg (3rd), Baden (17th), and Bavaria (22nd), by which the king of Prussia was to receive the supreme command of the allied armies in time of war. When Napoleon tried to retrieve his damaged prestige by securing compensation elsewhere. His proposal that the grand-duchy of Luxembourg, which had not been included in the new German Confederation, should fall to France by agreement with Prussia was no more successful than his other demands for “compensation.” Luxembourg was declared a neutral state by the convention of London in 1867 (see LUXEMBOURG), and the French proposal, published by Bismarck in The Times at the outset of the war of 1870, only damaged the French emperor’s cause in the eyes of Europe.

Meanwhile public feeling in France had become seriously excited by this sudden menace of a hostile power on her eastern frontier, and this excitement was raised to fever heat when it became known that the vacant throne of Spain had been offered to and accepted by a prince of the house of Hohenzollern. Napoleon’s policy had become hopeless discredited by the successive fiascos in Poland, Mexico and Germany, and even the establishment of constitutional Germany could not avail to restore confidence in him. He knew the risk he ran in challenging a conflict with a power whose military efficiency had been so strikingly displayed; but by refusing to do so, in the excited state of public feeling, he would have risked his throne. He reckoned on the traditional jealousy of the South German states for Prussia and their traditional friendship with France; he was assured, too, of the support of Austria, in the event of a victorious opening of the campaign. On the other hand Bismarck was bent on war, which, in accordance with his policy of “blood and iron,” he believed to be the sole effective means of binding the heterogeneous elements of Germany into a coherent whole. The device of the “Ems telegrams” (see BISMARCK) was sufficient to end the hesitations of Napoleon by giving an irresistible volume to the cry of the war party in France; and on the 19th of July the French emperor’s declaration of war was handed in at Berlin.

The story of the struggle that followed is told elsewhere (see FRANCO-GERMAN WAR). The hopes that Napoleon had based on the action of the South German courts was belied; and the first crushing German victories (Weissenburg, August 4, and Wörth, August 6) not only removed all chance of Austrian co-operation but brought down with a crash the imposing façade of the Second Empire. On the 2nd of September Napoleon surrendered, with his army, at Sedan; and two days later the Empire was overthrown and a provisional republican government set up at Paris. On the 19th Paris itself was invested and, after a heroic defence, capitulated on the 28th of January 1871. On the 18th of January, at the palace of Versailles, William I., king of Prussia, was proclaimed German emperor. On the 26th of February were signed the preliminaries of peace, by which France agreed to cede to the German empire Alsace (except Belfort and its territory) and German Lorraine, with Metz and Thionville (Diedenhofen), and to pay a war indemnity of five millions of francs (£200,000,000) in three years, to be secured by the occupation of French territory. The definitive treaty was signed at Frankfort on May 10, 1871.

The most important outcome of the events which culminated in the Franco-German War and its result was the establishment of a powerful German empire, which was destined to dominate the continent for years to come, and the expansive ambitions of which remain pregnant with menace for the future. So great an overturn, however, involved other changes in the territorial system, which may be briefly summarized. The most notable of these was the reconstruction of the Austrian monarchy as a result of the war of 1866. By the treaty of Vienna (October 3, 1866) between Austria and Italy, Austria recognized the Italian kingdom and ceded to it the city and territory of Venice, thus surrendering the traditional claim of the Habsburgs to domination in Italy. This was followed in 1867 by the establishment of the Dual Monarchy in the Habsburg dominions under the auspices of Bismarck’s rival, Count Beust,—Francis Joseph being crowned king of Hungary, and a separate constitution being established for Hungary and the Cis-Leithen dominions of the Austrian emperor (see Austria: History). In Italy, meanwhile, the unification of the kingdom had continued after the conclusion of the war of 1859 by the treaty of Zürich. In 1860 Tuscany, Parma and Modena were united to the monarchy of Victor Emmanuel, at the cost of the cession of Nice and Savoy to Napoleon. In May of the same year Garibaldi and his “Third” landed in Sicily, which he reduced by the end of June; in August he crossed to the mainland, and the capitulation of Francis II. of the Two Sicilies at Gaeta on the 13th of February 1861 ended the Bourbon kingdom in southern Italy. On the 17th of March Victor Emmanuel II. was proclaimed King of United Italy. This title, as mentioned above, was recognized by Austria in 1866, when Italy was increased by the cession of Venice. Finally, Rome, which had been preserved to the papacy by Napoleon’s troops, was on their withdrawal occupied by the Austrians in 1867, and the Italian government of Vittorio Emanuele II. was completed (see Italy: History).

Another significant outcome of the collapse of France was the denunciation by Russia of the “Black Sea” clauses of the treaty of Paris of 1856, an action rendered possible by the entente between the governments of Berlin and St Petersburg. In the note addressed to the signatory powers announcing that Russia no longer felt herself bound by the clauses of the treaty limiting her sovereign rights in the Black Sea, Prince Gorchakov wrote: “It would be difficult to affirm that the written law founded on the respect for treaties, as the basis of public right and rule of the relations of states, has preserved the same moral sanction as in former times.” The action of Russia was, in fact, a practical illustration of Bismarck’s dicta that “rebus sic stantibus is involved in all treaties that require performance” (Mem. ii. 280), and that “ultra posse nemo obligatur” holds good in spite of all treaty obligations whatsoever, nor can any treaty guarantee
the discharge of obligations when the private interest of those who lie under them no longer reinforces the text." (ib. ii. 270.) Great Britain did her best to counteract a doctrine so subversive of international confidence. For a moment at least a diplomatic breach with Russia seemed inevitable. At Bismarck's suggestion, however, a conference was held at London to arrange the affair. There was, in the circumstances, no chance of forcing Russia to recede from her position; but in order "to reconcile facts with principles" the conference on the 17th of January 1871 agreed on a formula announcing that "contracting powers can only rid themselves of their treaty engagements by an understanding with their co-signatories." Thus the principle of the European concert was saved. For, while at the time, it seemed that the triumph of Bismarck's diplomacy had re-established

... the simple plan
That they should take who have the power
And they should keep who can.

Beust was not far wrong when he exclaimed, "Je ne vois plus de l'Europe!" (W. A. P.)

By the Franco-German War of 1870-71 and the creation of the German empire the political condition of Europe was profoundly changed. Germany became for a time the leading power on the continent of Europe, and German statesmanship had to devise means for preventing war during the new edifice was thoroughly consolidated, the formation of a hostile coalition of jealous rivals. The first thing to be done in this direction was to secure the support of Russia and Austria to the new order of things.

With regard to Russia there was little cause for apprehension. She had aided Bismarck to carry out his audacious schemes in the past, and there was no reason to suppose that she would change her policy in the immediate future. The Russian policy towards Germany rapprochement dated from the Polish insurrection of 1863, when the governments of France and England, yielding to popular excitement, made strong diplomatic representations to Russia in favour of the Poles, whereas Bismarck not only refused to join in the diplomatic campaign, but made a convention with the cabinet of St Petersburg by which the Russian and German military authorities on the frontiers should aid each other in suppressing the disturbances. From that time the friendship ripened steadily. The relations between the two powers were not, it is true, always without a cloud. More than once the bold designs of Bismarck caused uneasiness and dissatisfaction in Russia; but these troubles were happily ended by the Schleswig-Holstein complications of 1864 and the Austro-Prussian conflict of 1866; but the wily statesman of Berlin, partly by argument and partly by dexterously manipulating the mutual trust and affection between the two sovereigns, always succeeded in having his own way without producing a rupture, so that during the Franco-German War of 1870-71 Russia maintained an extremely benevolent neutrality, and prevented Austria and Italy from taking part in the struggle. So benevolent was the neutrality that the emperor William at the end of the campaign felt constrained to write to the tsar that he owed to His Majesty the happy issue of the campaign and would never forget the fact. Having thus helped to create the German empire, Alexander II. was not likely to take an active part in destroying it, and Bismarck could look forward confidently to a long continuance of the cordial relations between the two courts.

The second part of the German chancellor's programme, the permanent conciliation of Austria, was not so easily carried out.

Austria had been the great sufferer, more perhaps even than France, from Bismarck's aggressive policy. For generations she had resisted the tendencies of time and events successfully. The efforts of the Hohenzollerns to play the leading part in Germany, and she had always considered her own influence in Germany as essential to the maintenance of her position as a first-class power. By the disastrous campaign of 1866 and the consequent treaty of Prague, Austria had been formally excluded from all direct influence in German affairs. With these events still fresh in his recollection, the emperor Francis Joseph could hardly be expected to support the new empire created by his rival at Austria's expense, and it was known that on the eve of the Franco-German War he had been negotiating with the French government for a combined attack on Prussia. To an ordinary statesman the task of permanently conciliating such a power might well have seemed hopeless, but Bismarck did not shrink from it, and even before the signature of the treaty of Prague he had prepared the way for attaining his object. "With regard to Austria," he himself explained on one occasion, "I had two courses open to me after her defeat, either to destroy her entirely or to respect her integrity and prepare for our future reconciliation when the fire of revenge had died out. I chose the latter course, because the former would have been the greatest possible act of folly. Supposing that Austria had disappeared, consider the consequences." He then described very graphically those probable consequences, and drew the conclusion: "For the sake of our own life Austria must live. I had no hesitation, therefore, and ever since 1866 my constant effort has been to stitch up the great torn texture and to re-establish amicable relations with our ancient associate of the Confederation." For this purpose he tried to soothe Austrian susceptibilities, and suggested confidentially that compensation for the losses of territory, influence and prestige in Italy and Germany might be found in south-eastern Europe, especially by the annexation of Bosnia and Herzegovina; but so long as his rival Count Beust was minister for foreign affairs in Austria, and Austria had the prospect of being able to recover her lost position by the assistance of Russia and France, these efforts had no success. It was only when Prince Gorchakov had declined Count Beust's advances, which took the form of suggesting the abolition of the Black Sea clauses of the treaty of Paris, and when France had been paralysed for some years by her war with Germany, that a rapprochement between the cabinets of Vienna and Berlin became possible. Bismarck lost no time in making advances. From the German headquarters at Versailles he sent a despatch to Vienna suggesting the establishing of more cordial relations between the two countries, and Count Beust replied in an equally amicable tone. The emperor Francis Joseph, finding himself isolated, had evidently accepted the inevitable with his customary resignation, and abandoned his dreams of again playing the leading part in Germany. As a further proof of the change in his disposition and aims he replaced Count Beust by Count Andrassy, who was a personal friend of Bismarck, and who wished, as a Hungarian, to see Austria liberated from her German entanglement, and he consented to pay a visit to Berlin for the purpose of drawing still closer the relations between the two governments.

Bismarck was delighted at this turn of affairs, but he advanced with his usual caution. He gave it to be clearly understood that improvement in his relations with Vienna must not disturb the long-established friendship with St Petersburg. The tsar, on hearing privately of the intended meeting, gave a hint to Prince Reuss, the German ambassador, that he expected an invitation, and was invited accordingly. The meeting of the three sovereigns took place at Berlin at the end of August 1872. The three ministers, Prince Bismarck, Prince Gorchakov and Count Andrassy, held daily conferences, on the basis that the chief aim in view should be the maintenance of peace in Europe, and that in all important international affairs the three powers should consult with each other and act in concert. As a result of three days' consultation the Three Emperor's League was founded, without any formal treaty being signed. In this way the danger of a powerful coalition being formed against the young German empire was averted, for in the event of a conflict with France, Germany could count at least on the benevolent neutrality of Russia and Austria, and from the other powers she had nothing to fear. What ulterior designs Bismarck may have had in forming the league, or "Alliance" as it is often called, must be to some extent a matter of conjecture, but we shall probably not be far wrong in adopting the view of a competent Russian authority, who defines the policy of the German chancellor thus: "To make Austria accept definitively her deposition as a Germanic power, to put
her in perpetual conflict with Russia in the Balkan Peninsula, and to found on that irreconcilable rivalry the hegemony of Germany.

For more than two years there was an outward appearance of extreme cordiality between the three powers. They acted together diplomatically, and on all suitable occasions the three allied monarchs exchanged visits and sent each other congratulations and good wishes. There was, however, from the beginning very little genuine confidence between them. Before the breaking up of the conferences at Berlin, Alexander II. and his chancellor had conversations with the French ambassador, in which they not only showed that they had suspicions of future aggressive designs on the part of Germany, but also gave an assurance that so long as France fulfilled her engagements to Germany she had nothing to fear. A few months later, when the emperor William paid his return visit to the tsar in St. Petersburg, a defensive convention was concluded by the two monarchs behind the back of their Austrian ally. Without knowing anything about the existence of this convention, the Austrian ally did not feel comfortable in his new position. In Vienna the old anti-Russian feeling was still strong. The so-called party of the archdukes and the military resisted the policy of Andrassy, and sought to establish closer relations with Russia, so that German support might be unnecessary, but as Bismarck has himself testified, "Russia did not yet respond. The wound caused by the conduct of Austria during the Crimean War was not yet healed. Andrassy made himself very popular in the court society of St. Petersburg during his visit there with his imperial master, but the traditional suspicion of Austrian policy remained." Altogether, the new league was not a happy family. So long as all the members of it were content to accept the status quo, the latent germs of dissension remained hidden from the outside world, but as soon as the temporary state of political quietude was replaced by a certain amount of activity and initiative, they forced their way to the surface. No one of the three powers regarded the status quo as satisfactory, and there was much anxiety caused by the rapid financial and military recovery of France, and voices were heard suggesting that a new campaign and a bigger war indemnity might be necessary before the recuperation was complete.

In St. Petersburg there was a determination to take advantage of any good opportunity for recovering the portion of Bessarabia ceded by the treaty of Paris, and thereby removing the last tangible results of the Crimean War. In Vienna there was a desire to obtain in the Balkan Peninsula, in accordance with the suggestion of Bismarck, compensation for the losses in Italy and Germany. Thus each of the members of the league was hatching secretly a little aggressive scheme for its own benefit, and the danger for the rest of Europe lay in the possibility of their reconciling their schemes so far as to admit of an agreement for action in common. Fortunately for the onlookers there were important conflicting interests, and the task of reconciling them was extremely difficult, as the subsequent course of events proved.

The first of the three powers to move was Germany. In February 1875 M. de Radowitz was despatched to St. Petersburg on a secret mission in order to discover whether, in the event of hostilities between Germany and France, Russia would undertake to maintain a neutral attitude as she had done in 1870-1871; in that case Germany might be relied on to co-operate with her in her great designs in the East. Prince Gorchakov did not take the bait with the alacrity that was expected. Having overcame in some measure his hatred of Austria, which had distorted for so many years his political vision, he had come to understand that it was not for the interests of his own country to have as neighbour a powerful united Germany instead of a weak confederation of small states, and he now perceived that it would be a grave error of policy to allow Germany to destroy still more to her own advantage the balance of power in Europe by permanently weakening France. No doubt he desired to recover the lost portion of Bessarabia and to raise Russian prestige in the East, but he did not wish to run the risk of exciting a great European war, and he believed that what he desired might be effected without war by the diplomatic skill which had warded off European intervention during the Polish troubles of 1863, and had recovered for Russia her freedom of action in the Black Sea during the Franco-Prussian War of 1870-71. In reply, therefore, to M. de Radowitz's inquiries and suggestions, he declared that the Russian court fostered no ambitious designs in the East or in the West, and desired only peace and the maintenance of the status quo, with possibly an amelioration in the miserable condition of the Christian subjects of the sultan. This rebuff did not suffice to dispel the gathering storm. The warlike agitation in the German inspired press continued, and the French government became thoroughly alarmed. General Lefebre, the French ambassador in St. Petersburg, was instructed to sound the Russian government on the subject. Prince Gorchakov willingly assured him that Russia would do all in her power to incline the Berlin cabinet to moderation and peace, and that the emperor would take advantage of his forthcoming visit to Berlin to influence the emperor William in this sense. A few days later General Lefebre received similar assurances from the emperor himself, and about the same time the British government volunteered to work likewise in the cause of peace. Representations were accordingly made by both governments during the tsar's visit to Berlin, and both the emperor William and his chancellor declared that there was no intention of attacking France. The danger of war, which the well-informed German press believed to be "in sight," was thus averted, but the incident sowed the seeds of future troubles, by awakening in Bismarck a bitter personal resentment against his Russian colleague. By certain incautious remarks to those around him, and still more by a circular to the representatives of Russia abroad, dated Berlin and beginning with the words maintenant la paix est assurée, Gorchakov seemed to take to himself the credit of having checkmated Bismarck and saved Europe from a great war.

Bismarck remained on the alert out of his old friend, and told him frankly that he would have reason to regret it. In the Russian official world it is generally believed that he took his revenge in the Russo-Turkish War and the congress of Berlin. However this may be, he has himself explained that "the first cause of coldness" was the above incident, "when Gorchakov, aided by Decazes, wanted to play at my expense the part of a saviour of France, to represent me as the enemy of European peace, and to procure for himself a triumphant quos ego to arrest by a word and shatter my dark designs!" In any case the incident marks the beginning of a new phase in the relations of the three powers; henceforth Bismarck can no longer count on the unequalled support of Russia, and in controlling the Russo-Austrian rivalry in southeastern Europe, while professing to be impartial, he will lean to the side of Count Andrassy rather than to that of Prince Gorchakov. He is careful, however, not to carry this tendency so far as to produce a rapprochement between Russia and France. The danger of a Franco-Russian alliance hostile to Germany is already appearing on the political horizon, but it is only a little cloud no bigger than a man's hand.

The next move in the aggressive game was made by Austria, with the connivance of Russia. During the summer of 1875 an insurrection of the Christian Slavs in Herzegovina, which received support from the neighbouring principalities of Montenegro and Servia, was fostered by the Austrian authorities and encouraged by the Russian consuls on the Adriatic coast. A European concert was formed for the purpose of settling the disturbance by means of local administrative reforms, but the efforts of the powers failed, because the insurgents hoped to obtain complete liberation from Turkish rule; and in the beginning of July, with a view to promoting this solution, Servia and Montenegro declared war against the Porte. Thereupon Russia began to show her hand more openly. The government allowed volunteers to be recruited in Moscow and St. Petersburg, and the Russian general Chernyayev, who had distinguished himself in Central Asia, was appointed to the
command of the Servian army. When the ball had thus been set rolling, the two powers chiefly concerned considered that the time had come for embodying the result of their informal confidential parleys in a secret agreement, which is known as the convention of Reichstadt, because it was signed at a meeting of the two emperors in the little Bohemian town of that name. It bore the date of the 8th of July 1876— exactly a week after Servia and Montenegro had declared war—and it contained the following stipulations: (1) That so long as the struggle which had just begun remained undecided, the two sovereigns should refrain from interference, and that in the event of the principalities being defeated, any modification of the territorial or political status quo ante to their detriment should be prevented; (2) that the in event of the principalities proving victorious, and territorial changes taking place, Austria should claim compensation in Bosnia and Herzegovina, and Russia should demand the restitution of the portion of Servia which she had lost by the Crimean War; (3) that in the event of the collapse of the Ottoman empire, the two powers should act together to create autonomous principalities in European Turkey, to unite Thessaly and Servia, and to proclaim Constantinople a free town. The contracting parties evidently expected that the two principalities would be victorious in their struggle with the Porte, and that the compensations mentioned would be secured without a great European war. Their expectations were disappointed. Montenegro made a brave stand against superior forces, but before five months had passed Servia was at the mercy of the Turkish army, and Russia had to come to the assistance of her protectê. A Russian ultimatum stopped the advance of the Turks on Belgrade, and an armistice, subsequently transformed into a peace, was signed.

Russia and Austria had now to choose between abandoning their schemes and adopting some other course of action, and unforeseen incidents contributed towards making them select the latter alternative. In June 1876 an attempt at insurrection in Bulgaria had been repressed with savage brutality by the Turks, and the details, as they became known some weeks later, produced much indignation all over Europe. In England the excitement, fanned by the eloquence of Gladstone, was increased, and to proclaim Constantinople a free town to take part, very reluctantly, in a diplomatic campaign, with the object of imposing radical reforms on Turkey. In Russia the excitement and indignation were equally great, and the tsar gradually formed the resolution that if the powers would not act collectively and energetically, so as to compel the Porte to yield, he would undertake the work single-handed. This resolution he announced publicly in a speech delivered at Moscow on the 10th of November 1876. The powers did not like the idea of separate Russian action, and in order to prevent it they agreed to hold a conference in Constantinople for the purpose of inducing the Porte to introduce the requisite reforms. The Porte was at that moment under the influence of popular patriotic excitement which made it disposed to accept orders, or even well-meaning advice, from governments more or less hostile to it, and the inconclusive mode of procedure suggested by General Ignatiev, and adopted by the other delegates, made it still more non-complimentary. At the first plenary sitting of the conference the proceedings were disturbed by the sound of artillery, and the Turkish representative explained that the two were in the spirit of the new Ottoman constitution, which was being promulgated by the sultan. The inference suggested was that Turkey had spontaneously entered on the path of liberal and constitutional reform for all Ottoman subjects, it became superfluous and absurd to talk of small reforms for particular provinces, such as the conference was about to propose. The deliberations continued, but finally the Porte refused to accept what the plenipotentiaries considered an irreducible minimum, and the conference broke up without obtaining any practical result. The tsar's Moscow declaration about employing single-handed the requisite coercive measures now came to be fulfilled.

In order to make a successful aggressive move on Turkey, Russia had first of all to secure her rear and flank by an arrangement with her two allies. In Berlin she encountered no difficulties. Bismarck had no objection to seeing Russia weaken herself in a struggle with Turkey, provided she did not upset the balance of power in south-eastern Europe, and he felt confident that he could prevent by diplomatic means any such catastrophe. He was inclined, therefore, to encourage rather than restrain the bellicose tendencies of St Petersburg. In Vienna the task of coming to a definite arrangement was much more difficult, and it was only after protracted and laborious negotiations that a convention was concluded on the 15th of January 1877, and formally signed three months later. It was a development of the agreement of Reichstadt, modified according to the changes in the situation, but retaining the essential principle that in the event of the territorial status quo being altered, Russia should recover the lost portion of Bessarabia, and Austria should get Bosnia and a part of Herzegovina. Having made these preliminary arrangements, Russia began the campaign simultaneously in Europe and Asia Minor, and after many reverses and enormous sacrifices of blood and treasure, she succeeded in imposing on the Turks the "preliminary peace" of San Stefano (3 March 1878). That peace was negotiated with very little consideration for the interests of the other powers, and as soon as the terms of it became known in Vienna and London there was an outburst of indignation. In negotiating the treaty General Ignatiev had ignored the wishes of Austria, and had even, according to the contention of Andrassy, infringed the convention signed at the beginning of the war. However this may be, the peace of San Stefano brought to the surface the latent conflict of interests between the two empires. Russia's aim was to create a big Bulgaria under the influence of St. Petersburg, and to emancipate Servia and Montenegro as far as possible from Austrian influence, whereas Austria objected to the creation of any large Slav state in the Balkan Peninsula, and insisted on maintaining her influence at Belgrade and Tsetigne (Cetinje). In vain Prince Gorchakov endeavoured to conciliate Austria and to extract from Count Andrassy a clear statement of the terms he would accept. Count Andrassy was in no hurry to extort Russia from her difficulties, and suggested that the whole question should be submitted to a big league of European powers. That peace was negotiated with very little consideration for the interests of the other powers, and as soon as the terms of it became known in Vienna and London.

Deceived in her expectations of active support from her two allies, Russia found herself in an awkward position. From a military point of view it was absolutely necessary for her to come to an arrangement either with Austria or with England, because the communications of her army before Constantinople with its base could be cut by these two powers acting in concert—the land route being dominated by Austria, and the Black Sea route by the British fleet, which was at that time anchored in the Sea of Marmora. As soon, therefore, as the efforts to obtain the support of her two allies against the demands of England had failed, negotiations were opened in London, and on the 30th of May a secret convention was signed by Lord Salisbury and Count Schuvalov. By that agreement the obstacles to the assembling of the congress were removed. The congress met in Berlin on the 13th of June, and after an impressive series of negotiations by Count Galitzin the treaty of Berlin was signed on the 13th of July. By that treaty the preliminary peace of San Stefano was considerably modified. The big Bulgaria defined by General Ignatiev was divided into three portions, the part between the Danube and the Balkans being transformed into a vassal principality, the part between the Balkans and the Rhodope being made into an autonomous province, called Eastern Rumelia, under a Christian governor named by the sultan with the assent of the powers, and the remainder being placed again under the direct rule of the Porte. The independence of Montenegro, Servia and Rumania was formally recognized, and each of these principalities received a considerable accession of territory. Rumania, however,
in return for the Dobrudja, which it professed not to desire, was obliged to give back to Russia the portion of Bessarabia ceded after the Crimean War. In Asia Minor Russia agreed to confine her annexations to the districts of Kars, Ardahan, and Batum, and to restore to Turkey the remainder of the occupied territory. As a set-off against the large acquisitions of the Slav races, the powers recommended that the sultan should cede to the kingdom of Greece the greater part of Thessaly and Epirus, under the form of a rectification of frontiers. At first the sultan refused to act on this recommendation, but in March r88i a compromise was effected by which Greece obtained Thessaly without Epirus. Bosnia and Herzegovina were to be occupied and administered by Austria-Hungary, and the Austrian authorities were to have the right of making roads and keeping garrisons in the district of Novi-Bazar, which lies between Servia and Montenegro. In all the provinces of European Turkey for which special arrangements were not made in the treaty, the Porte undertook (Art. 23) to introduce organic statutes similar to that of Crete, adapted to the local conditions. This article, like many of the subordinate stipulations of the treaty, remained a dead letter. We may mention specially Art. 61, in which the Sublime Porte undertook to realize without delay the indemnities and reparations required in the provinces inhabited by Armenians, and to guarantee their loyalty against the Circassians and Kurds. Equally unreliable proved the scheme of Lord Beaconsfield to secure good administration throughout the whole of Asia Minor by the introduction of reforms under British control, and to prevent the further expansion of Russia in that direction by a defensive alliance with the Porte. A convention to that effect was duly signed at Constantinople a few days before the meeting of the congress (1th June 1878), but the only part of it which was actually realized was the occupation and administration of Cyprus by the British government. The new frontiers stipulated in the treaty of San Stefano, and subsequently rectified by the treaty of Berlin, are shown in the accompanying sketch-map.

The secret schemes of Russia and Austria, in so far as they were defined in the agreement of Reichstadt and the subsequent Austro-Russian treaty of Vienna, had thus been realized. Russia had recovered the lost portion of Bessarabia, and Austria had practically annexed Bosnia and Herzegovina, though the nominal suzerainty of the Porte was over the two provinces remained. But Russia was far from satisfied with the results; which seemed to her not at all commensurate with the sacrifices imposed on her by the war, and her dissatisfaction led to a new grouping of the powers. Before the opening of the Berlin congress Bismarck had announced publicly that he would refrain from taking sides with any of the contending parties, and would confine himself to playing the part of an honest broker. The announcement was received by the Russians with astonishment and indignation. What they expected was not an impartial arbiter, but a cordial and useful friend in need. In 1871 the emperor William, as we have seen, had spontaneously declared to the tsar that Germany owed to His Majesty the happy issue of the war, and that she would never forget it, and we may add that on that occasion he signed himself "Your ever grateful Friend." Now, in 1878, when the moment had come for paying at least an instalment of this debt, and when Russia was being compelled to make concessions which she described as incompatible with her dignity, Bismarck had nothing better to offer than honest brokerage. The indignation in all classes was intense, and theTsar put it in plain language: Bismarck's "duplicity" and "treachery" were supposed to receive ample confirmation during the sittings of the congress and the following six months.

The emperor William, as we have seen, had spontaneously declared to the tsar that Germany owed to His Majesty the happy issue of the war, and that she would never forget it, and we may add that on that occasion he signed himself "Your ever grateful Friend." Now, in 1878, when the moment had come for paying at least an instalment of this debt, and when Russia was being compelled to make concessions which she described as incompatible with her dignity, Bismarck had nothing better to offer than honest brokerage. The indignation in all classes was intense, and the Tsar put it in plain language: Bismarck's "duplicity" and "treachery" were supposed to receive ample confirmation during the sittings of the congress and the following six months.

On the 4th of February 1870 Prince Gorchakov wrote to the ambassador in Vienna: "Needless to say, that in our eyes the Three Emperors' Alliance is practically torn in pieces by the conduct of our two allies. At present it remains for us merely to terminate the liquidation of the past, and to seek henceforth support in ourselves alone." The same view of the situation was taken in Berlin and Vienna, though the result was attributed, of course, to different causes, and the danger of serious complications became so great that Bismarck concluded with Andrassy in the following October (1879) a formal defensive alliance, which was avowedly directed against Russia, and which subsequently developed into the Triple Alliance, directed against Russia and France.

The causes of the rupture are variously described by the different parties interested. According to Bismarck the Russian government began a venomous campaign against Germany in the press, and collected, with apparently hostile intentions, enormous masses of troops near the German and Austrian frontiers, whilst the tsar adopted in his correspondence with the emperor William an arrogant and menacing tone which could not be tolerated. On the other hand, the Russians declare that the so-called Press-Campaign was merely the spontaneous public expression of the prevailing disappointment among all classes in Russia, that the military preparations had a purely defensive character, and that the tsar's remarks, which roused Bismarck's ire, did not transgress the limits of friendly expostulation such as sovereigns in close friendly relations might naturally employ.

Subsequent revelations tend rather to confirm the Russian view. After an exhausting war and without a single powerful ally, Russia was not likely to provoke wantonly a great war with Germany and Austria. The press attacks were not more violent than those which frequently appear in newspapers which draw their inspiration from the German foreign office, and the accusations about the arrogant attitude and menacing tone of Alexander II. are not at all in harmony with his known character, and are refuted by the documents since published by Dr Busch. The truth seems to be that the self-willed chancellor was actuated by nervous irritation and personal feeling more than by considerations of statecraft. His imperial master was not convinced by his arguments, and showed great reluctance to permit the conclusion of a separate treaty with Austria. Finally, with much searching of heart, he yielded to the importunity of his minister, but in thus committing an unfriendly act towards his old ally, he so softened the blow that the personal good relations between the two sovereigns suffered merely a momentary interruption. Bismarck himself soon recognized that the permanent estrangement of Russia would be a grave mistake of policy, and the very next year (1880), negotiations for a treaty of defensive alliance between the two cabinets were begun. Nor did the accession to the throne of Russia of Alexander III., who had long enjoyed the reputation of being systematically hostile to Germans, produce a rupture, as was expected. Six months after his father's death, the young tsar met the old kaiser at Danzig.
(September 1881), and some progress was made towards a complete renewal of the traditional friendship. Immediately afterwards a further step was taken towards re-establishing the old state of things with regard also to Austria. On his return to St Petersburg, Alexander III. remembered that he had received some time previously a telegram of congratulation from the emperor Francis Joseph, and he now replied to it very cordially, referring to the meeting at Danzig, and describing the emperor William as "that venerable friend with whom we are united in the common bonds of a profound affection." The words foreshadowed a revival of the Three Emperors' League, which actually took place three years later.

The removal of all immediate danger of a Franco-Russian alliance did not prevent Bismarck from strengthening in other ways the diplomatic position of Germany, and the result of his efforts soon became apparent in the alliance of Italy with the two central powers. Even since the Franco-German War of 1870-71, and more especially since the congress of Berlin in 1878, the Italian government had shown itself restless and undecided in its foreign policy. As it was to France that Italy owed her emancipation from Austrian rule, it was natural that the two countries should remain allies, but anything like cordial co-operation was prevented by conflicting interests and hostile feeling. The French did not consider the acquisition of Savoy and Nice a sufficient compensation for the assistance they had given to the cause of Italian unity, and they did not know, or did not care to remember, that their own government was greatly to blame for the passive attitude of Italy in the hour of their great national misfortunes. On the other hand, a considerable amount of bitterness against France had been gradually accumulating in the hearts of the Italians. As far back as the end of the war of 1859, popular opinion had been freely expressed against Napoleon III., because he had failed to keep his promise of liberating Italy "from the Alps to the Adriatic." The feeling was revived and intensified when it became known that he was opposing the annexation of central and southern Italy, and that he obtained Savoy and Nice as the price of partly withdrawing his opposition. Subsequently, in the war of 1866, he was supposed to have insulted Italy by making her conclude peace with Austria, on the basis of the cession of Venetia, before she could wipe out the humiliation of her defeats at Custozza and Lissa. Then came the French protection of the pope's temporal power as a constant source of irritation, producing occasional explosions of violent hostility, as when the new Chassepot rifles were announced to have "worked wonders" among the Garibaldians at Mentana. When the Second Empire was replaced by the Republic, the relations did not improve. French statesmen of the Thiers school had always condemned the imperial policy of permitting and even encouraging the creation of large, powerful states on the French frontiers, and Thiers himself publicly attributed to this policy the misfortunes of his country. With regard to Italy, he said openly that he regretted what had been done, though he had no intention of undoing it. The first part of this statement was carefully noted in Italy, and the latter part was accepted with scepticism. In any case his hand might perhaps be forced, for in the first republican chamber the monarchical and clerical element was very strong, and it persistently attempted to get something done in view of the temporal power. Events of the party of the Left undertook the direction of affairs in 1876, but the government did not become anti-clerical in its foreign policy, and Italian statesmen resigned themselves to a position of political isolation. The position had its advantages. Events in the Balkan Peninsula foreshadowed a great European war, and it seemed that in the event of Europe's being divided into two hostile camps, Italy might have the honour and the advantage of regulating the balance of power. By maintaining good relations with all her neighbours and carefully avoiding all inconvenient entanglements, she might come forward at the critical moment and dictate her own terms to either of the contending parties, or offer her services to the highest bidder. This Machiavellian policy did not give the expected results. Being friends with everybody in a general way may be the best course for an old, conservative country which desires merely the maintenance of the status quo, but it does not secure the energetic diplomatic support required by a young enterprising state which wishes to increase its territory and influence. At the congress of Berlin, when several of the powers got territorial acquisitions, Italy got nothing. The Italians, who were in the habit of assuming, almost as a matter of principle, that from all European complications they had a right to obtain some tangible advantage, were naturally disappointed, and they attributed their misfortune to their political isolation. The policy of the free hand consequently fell into disrepute, and the desire for a close, efficient alliance revived. But with what power or powers should an alliance be made? The remnants of the old party of action, who still carried the Italia Irredenta banner, had an answer ready. They recommended that alliances should be concluded with a view to wresting from Austria the Trentino and Trieste, with Dalmatia, perhaps, into the bargain. On the other hand, the Conservatives and the Moderates considered that the question of the Trentino and Trieste was much less important than that of political influence in the Mediterranean. A strong Austria was required, it was said, to bar the way to the Adriatic, and France must not be allowed to pursue unchecked her policy of transforming the Mediterranean into a French lake. Considerations of this kind led naturally to the conclusion that Italy should draw closer to the powers of central Europe. So the question appeared from the standpoint of "la haute politique." From the less elevated standpoint of immediate political interests, it presented conflicting considerations. A rapprochement with the central powers might prevent the conclusion of a commercial treaty with France, and thereby increase the financial and economic difficulties with which the young kingdom was struggling, whereas a rapprochement with France would certainly excite the hostility of Bismarck, who was retiring from the Kulturkampf and journeying towards Canossa, and who might possibly conciliate the pope by helping him to recover his temporal sovereignty at the expense of Italy. Altogether the problem was a very complicated one. The conflicting currents so nearly balanced each other, that the question as to which way the ship would drift might be decided by a little squall of popular sentiment. A very big squall was brewing.

During the congress of Berlin the French government was very indignant when it discovered that Lord Beaconsfield had recently made a secret convention with the sultan for the British occupation of Cyprus, and in order to calm its resentment Lord Salisbury gave M. Waddington to understand that, so far as England was concerned, France would be allowed a free hand in the Regency of Tunis, which she had long coveted. Though the conversations on the subject and a subsequent exchange of notes were kept strictly secret, the Italian government soon got wind of the affair, and it was at first much alarmed. It considered, in common with Italians generally, that Tunis, on the ground of historic right and of national interests, should be reserved for Italy, and that an extension of French territory in that direction would destroy, to the detriment of Italy, the balance of power in the Mediterranean. These apprehensions were calmed for a time by assurances given to the Italian ambassador in Paris M. Gambetta assured General Cialdini that he had no intention of making Italy an irreconcilable enemy of France, and M. Waddington declared, on his word of honour, that so long as he remained minister of foreign affairs nothing of the sort would be done by France without a previous understanding with the cabinet of Rome. M. Waddington honourably kept his word, but his successor did not consider himself bound by the assurance; and when it was found that the Italians were trying systematically to establish their influence in the Regency at the expense of France, the French authorities, on the ground that a Tunisian tribe called the Kroumirs had committed depredations in Algeria, sent an armed force into the Regency, and imposed on the bey the Bardo treaty, which transformed Tunis into a French protectorate.

The establishment of a French protectorate over a country
which the Italians had marked out for themselves as necessary for the defence and colonial expansion of the kingdom, had the effect which Gambetta had foreseen—it made Italy, for a time at least, the irreconcilable enemy of France. Whilst the French were giving free expression to their patriotic exultation, and even Gambetta himself, in defiance of what he had said to Cialdini, was congratulating Jules Ferry on having restored France to her place among the nations, the Italians were trying to soothe their indignation and to discover some means of retrieving what they had lost. The only remedy seemed to be to secure foreign alliances, and there was now no hesitation as to where they should be sought. Simple people in Italy imagined that if an alliance had been concluded sooner with Germany and Austria, these powers would have prevented France from trampling on the sacred interests of Italy. This idea was entirely erroneous, because Austria had little or no interest in the Tunisian Question, and Bismarck was not at all sorry to see France embark on an enterprise which distracted her attention from Alsace-Lorraine and removed all danger of a Franco-Italian alliance. The illusion, however, had a powerful influence on Italian public opinion. The government was now urged to conclude without further delay an alliance with Russia; and the proposals which were not unwelcome to the king, because most of the Italian Gallicophils had anti-dynastic and republican tendencies, and he was naturally disposed to draw nearer to governments which proclaimed themselves the defenders of monarchical institutions and the opponents of revolutionary agitation. After protracted negotiations, in which Italy tried in vain to secure protection for her own separate interests in the Mediterranean, defensive treaties of alliance were concluded with the cabinets of Vienna and Berlin in May 1882. Though the Italian statesmen did not secure by these treaties all they wanted, they felt that the kingdom was protected against any aggressive designs which might be entertained by France or the Vatican, and when the treaties were renewed in 1887 they succeeded in getting somewhat more favourable conditions.

By the creation of this Triple Alliance, which still subsists, the diplomatic position of Germany was greatly strengthened, but Bismarck was still haunted by the apprehension of a Franco-Russian Alliance, and he made repeated attempts to renew the old cordial relations with the court of St. Petersburg. He was bold enough to hope that, notwithstanding the Austro-German treaty of October 1879, avowedly directed against Russia, and the new Triple Alliance, by which the Austro-German Alliance was strengthened, he might resuscitate the Three Emperors' League in such a form as to ensure, even more effectually than he had done on the former occasion, the preponderance of Germany in the arrangement. With this object he threw out a hint to the Russian ambassador, M. Sabinoff, in the summer of 1883, that the evil results of the congress of Berlin might be counteracted by a formal agreement between the three emperors. The suggestion was transmitted privately by M. Sabinoff to the tsar, and was favourably received. Alexander III. was disquieted by the continuance of the nihilist agitation, and was not averse from drawing closer to the conservative powers; and as he desired tranquillity for some time in the Balkan Peninsula, he was glad to have security that his rival would do nothing in that part of the world without a previous understanding. M. de Giers, who had now succeeded Prince Gorchakov in the direction of foreign affairs, was accordingly despatched to Friedrichshah to discuss the subject with Bismarck. The practical result of the meeting was that negotiations between the two governments were begun, and on the 23rd of March 1884 a formal document was signed in Berlin. About six months later, in the month of September, the three emperors met at Skiernevice and ratified the agreement. Thus, without any modification of the Triple Alliance, which was directed against Russia, the old Three Emperors' League, which included Russia, was revived. Germany and Austria, being members of both, were doubly protected, for in the event of being attacked they could count on at least the benevolent neutrality of both Russia and Italy. France was thereby completely isolated.

In drawing up the secret treaty of Skiernevice, which may be regarded as the chef-d'œuvre of Bismarckian diplomacy, the German chancellor's chief aims evidently were to paralyse Russia by yoking her to Germany and Austria, to isolate France, and to realize his old scheme of holding the balance between Russia and Austria in the Balkan Peninsula. With a view to attaining the first two objects it was stipulated that if any one of the three powers were forced to make war on a fourth power, the two other contracting parties should observe a benevolent neutrality towards their ally. If we may believe a well-informed Russian authority, Bismarck wished it to be understood that in the event of two of the powers being at war with a fourth, the stipulation about benevolent neutrality should still hold good, but Alexander III. objected, on the ground that he could not remain a passive spectator of a duel in which France would be confronted by two antagonists. In his third object Bismarck was successful, for it was expressly laid down that in all cases of a disagreement between two of the parties in the affairs of the Balkan Peninsula, the third power should decide between them. This meant, of course, that in all discussions between Russia and Austria, the two great rivals in the Eastern Question, Bismarck should always have a casting vote. In return for all this, Russia obtained two small concessions: firstly, that Germany and Austria should seek to restrain the tsar from permitting the passage of the Dardanelles to an English fleet, as he had done in 1878, when the Russian army was before Constantinople; and, secondly, that they should not oppose the union of Bulgaria and Eastern Rumelia, if it was accomplished by the force of things and within the limits traced by the congress of Berlin.

This new form of the Three Emperors' League had all the organic defects of its predecessor, and was destined to be still more shortlived. The claims of Russia and Austria might be reconcilable in theory, but in practice they were sure to conflict; and however much Bismarck might try to play the part of an honest broker, he was certain to be suspected of opposing Russia and favouring Austria. It was therefore only during a period of political stagnation in south-eastern Europe that the arrangement could work smoothly. The political stagnation did not last long. Prince Alexander of Bulgaria had for some time been fretting under the high-handed interference of the Russian agents in the principality, and had begun to oppose systematically what the Russians considered their legitimate influence. Relations between Sofia and St. Petersburg had consequently become strained, when a crisis was suddenly brought about by the revolution of Philippopolis in September 1885. The conspirators arrested and expelled the governor-general, who had been appointed by the sultan with the assent of the powers, and at the same time proclaimed the union of the autonomous province of Eastern Rumelia with the principality of Bulgaria, in defiance of the stipulations of the treaty of Berlin. The revolution had been effected with the connivance and approval of the regularly accredited Russian agents in Philippopolis, but it had not received the sanction of the Russian government, and was resented as a new act of insubordination on the part of Prince Alexander. When he arrived in Philippopolis and accepted the declaration of union, the cabinet of St. Petersburg protested against any such infraction of the Berlin treaty, and the Porte prepared to send an army into the province. It was restrained from taking this step by the ambassadors in Constantinople, so that an armed conflict between Turks and Bulgarians was prevented; but no sooner had the Bulgarians been relieved from this danger on their eastern frontier, than they were attacked from the west by the Servians, who were determined to get ample compensation for any advantage which the Bulgarians might obtain. The Bulgarian army defeated the Servians at Slivnitz (November 19–20, 1885), and was marching on Belgrade when its advance was stopped and an armistice arranged by the energetic intervention of the Austrian government. Following the example of the Servians, the Greeks were preparing
to exact territorial compensation likewise; but as their mobiliza-

tion was a slow process, the powers had time to restrain them
from entering on active hostilities, first by an ultimatum (April
26, 1886), and afterwards by a blockade of their ports (May 8, 1886).

By that time, thanks to the intervention of the powers, a peace
between Bulgaria and Servia had been signed at Bucharest
(March 3); and with regard to Eastern Rumelia a compromise
had been effected by which the formal union with the principality
was rejected, and the prince was appointed governor-general of
the province for a term of five years. This was in reality a union
in disguise.

The diplomatic solution of the problem averted the danger of
a European war, but it left a great deal of dissatisfaction,
which soon produced new troubles. Not only had Prince
Alexander escaped punishment for his insubordination to
Russia, but he and the anti-Russian party among the Bulgarians
had obtained a decided success. This could not well be tolerated.

Before six months had passed (August 21, 1886) Prince Alexander
was kidnapped by conspirators in his palace at Sofia and con-
veyed secretly to Russian Bessarabia. As soon as the incident
was reported to the tsar, the prince was released, and he at once
returned to Sofia, where a counter-revolution had been effected
in his favour; but he considered his position untenable, and
formally abdicated. A fortnight after his departure for Bucharest
Kaulbars arrived in Sofia with instructions from the tsar to reestablish
in accordance with Russian interests. In St Petersburg it was supposed that the Bulgarian people were
still devoted to Russia, and that they were ready to rise against
and expel the politicians of the Nationalist party led by Stam-
bolof. General Kaulbars accordingly made a tour in the country
and delivered speeches to the assembled multitudes, but Stam-
bolof's political organization counteracted all his efforts, and on
the 20th of November he left Bulgaria and took the Russian
consul with him. Stambolof maintained his position, suppressed
energetically several insurrectionary movements, and succeeded
in getting Prince Ferdinand of Coburg elected prince (July 7,
1887), in spite of the opposition of Russia, who put forward as
candidate a Russian subject, Prince Nicholas of Mingrelia.

Prince Ferdinand was not officially recognized by the sultan and
the powers, but he continued to reign under the direction of
Stambolof, and the Russian government, passively accepting
the accomplished facts, awaited patiently a more convenient
moment for action.

These events in the Balkan Peninsula necessarily affected the
mutual relations of the powers composing the Three Emperors' 
League, and Austria could not remain a passive and disinterested
spectator of the action of Russia in Bulgaria. Her agents had
given a certain amount of support to Prince Alexander in his
efforts to emancipate himself from Russian domination; and
when the prince was kidnapped and induced to abdicate, Count
Kalnoky had not concealed his intention of opposing further
aggression. Bismarck resisted the pressure brought to bear on
him from several quarters in favour of the anti-Russian party
in Bulgaria, but he was suspected by the Russians of siding with
Austria and secretly encouraging the opposition to
Russian influence. This revived the hatred against
him which had been created by his pro-Austrian
leanings after the Russo-Turkish War. The feeling was
assiduously fomented by the Russian press, especially by
M. Katkoff, the editor of the Moscov Gazette, who exercised
great influence on public opinion and had personal relations with
Alexander III. On the 31st of July 1886, three weeks before the
kidnapping of Prince Alexander, he had begun a regular journalistic campaign against Germany, and advocated strongly a new
orientation of Russian policy. M. de Giers, minister of foreign
affairs, was openly attacked as a partisan of the German alliance,
and his "pamphlets to Friedrichshruh and Berlin" were compared
to the humiliating journeys of the old Russian grand-
princes to the Golden Horde in the time of the Tatar domination.

The moment had come, it was said, for Russia to emancipate
herself from German diplomatic thraldom, and for this purpose a
rapprochement with France was suggested. The idea was well
received by the public, and it seemed to be not unpalatable to
the tsar, for the Moscow Gazette was allowed to continue its
attacks on M. de Giers's policy of maintaining the German
alliance. In Berlin such significant facts could not fail to
produce uneasiness, because one of the chief aims of Bismarck's
policy had always been to prevent a Russo-French entente cordiale.
The German press were instructed to refute the arguments of their Russian colleagues, and to prove that if
Russia had really lost her influence in the Balkan Peninsula, the
fact was due to the blunders of her own diplomacy. The con-
troversy did not produce at once a serious estrangement between
the two cabinets, but it marked the beginning of a period of vacil-
lation on the part of Alexander III. When the treaty of Skirnev-
vice was about to expire in 1887, he positively refused to renew the
Three Emperors' League, but he consented to make, without the
co-operation of Austria, a secret treaty of alliance with Germany
for three years. Not satisfied with this guarantee against the
danger of a Franco-Russian alliance, Bismarck caused attacks
to be made in the press on Russian credit, which was rapidly
gaining a footing on the Paris bourse, and he imprudently showed
his hand by prohibiting the Reichsbank from accepting Russian
securities as guarantees. From that moment the tsar's attitude
changed. All his dormant suspicions of German policy revived.

In the autumn of 1887, the sultan of Turkey, who had passed his
lengthy illness, was still growing stronger, and Bismarck had a long
audience, in which he defended himself with his customary ability, but Alexander remained unmoved in his conviction
that the German government had systematically opposed
Russian interests, and had paralysed Russian action in the
Balkan Peninsula for the benefit of Austria; and he failed to
understand the ingenious theory put forward by the German
chancellor, that two powers might have a severe economic struggle without affecting their political relations. Bismarck had
to recognize that, for the moment at least, the Three Emperors'
League, which had served his purposes so well, could not be
suspected, but he had still a certain security against the hostility
of Russia in the secret treaty. Soon, however, this link was also
to be broken. When the treaty expired in 1890 it was not renewed.
By that time Bismarck had been dismissed, and he subsequently reproached his successor, Count Caprivi, with not
having renewed it, but in reality Count Caprivi was not to blame.
Alexander III. was determined not to renew the alliance, and
was already gravitating slowly towards an understanding with
France.
the enthousiastic ovations which the admiral and his subordinates received in Toulon and Paris. (October 1893) showed how eager and anxious the French people were for an alliance with Russia, but the Russian government was in no hurry to gratify their wishes. Of the official action all we know with certainty is, that immediately after the Cronstadt visit in 1891 a diplomatic protocol about a defensive alliance was signed; that during the special mission of General Boisdeffre to St Petersburg in 1892 negotiations took place about a military convention; that in 1894 the military convention was ratified; that in the summer of 1895 M. Ribot, when prime minister, first spoke publicly of an alliance; and that during the visit of the president of the French Republic to St Petersburg, in August 1897, France and Russia were referred to as allies in the complimentary speeches of the tsar and of M. Félix Faure. Though we are still in the dark as to the precise terms of the arrangement, there is no doubt that close friendly relations were established between the two powers, and that in all important international affairs they sought to act in accord with each other. It is equally certain that for some years Russia was the predominant partner, and that, in accordance with the stipulation of the treaty, she systematically exercised a restraining influence on France.

The great expectation excited among the French people by the entente cordiale were consequently not realized, and there appeared gradually premonitory symptoms of a reaction in public opinion, but the alliance between the two governments was maintained, and though the Triple Alliance was weakened by the internal troubles of Austria-Hungary and by a tendency on the part of Italy to gravitate towards France, the grouping of the great powers was not radically changed till the Russo-Japanese War of 1904-5. By that war the balance of power in Europe was seriously disturbed. Russia inadvertently provoked a struggle with Japan which made such a drain on her energies and material resources that her political influence in Europe necessarily suffered a partial eclipse. Thus the Triple Alliance outweighed its rival, and there was a danger of the German emperor's taking advantage of the situation to secure for himself a diplomatic predominance in Europe. France at once perceived that there was a grave danger for herself, and naturally looked about for some diplomatic support to replace that of Russia, which had lost much of its value. From her uncomfortable isolation there were only two possible exits—a rapprochement with Germany or a rapprochement with England. Both of these demanded sacrifices. The former required a formal abandonment of all ideas of recovering Alsace and Lorraine; the latter a formal recognition of British predominance in Egypt. Under the influence of M. Delcassé the French government chose what seemed the lesser of two evils, and concluded with the English foreign office in April 1904 a general agreement, of which the most important stipulation was that France should leave England a free hand in Egypt, and that England in return should allow France, within certain limits, a free hand in Morocco. On that basis was effected a rapprochement between the two governments which soon developed into an entente cordiale between the two nations.

The efforts of the German emperor to undermine the entente by insisting on the convocation of a conference to consider the Moroccan question caused M. Delcassé to resign, and produced considerable anxiety throughout Europe, but the desired result was not attained. On the contrary, the conference in question, which met at Algeciras in January 1906, ended in strengthening the entente and in accentuating the partial isolation of Germany.

The grouping of the great continental states into two opposite but not necessarily hostile camps helped to preserve the balance of power and the peace of Europe. The result was that the causes of conflict which arose from time to time up to the end of the 19th century were localized. Some of the principal questions involved may be more particularly mentioned.

The Armenian Question was brought prominently before Europe by the Russo-Turkish War of 1877-78. In the treaties of San Stefano and Berlin the Sublime Porte undertook "to carry out without delay the ameliorations and reforms required by local needs in the provinces inhabited by the Armenians, and to guarantee their security against the Circassians and the Kurds." This stipulation remained a dead letter, and the relations between the Armenians and the Mussulmans became worse than before, because the protection of the powers encouraged in the oppressed nationality far-reaching political aspirations, and the sultan regarded the political aspirations and the intervention of the powers as dangerous for the integrity and independence of his empire. For some fifteen years the Armenians continued to hope for the efficacious intervention of their protectors, but when their patience became exhausted and the question seemed in danger of being forgotten, they determined to bring it again to the front. Some of them confined themselves to agitating abroad, especially in England, in favour of the cause, whilst others made preparations for exciting an insurrectionary movement in Constantinople and Asia Minor. These latter knew very well that an insurrection could be suppressed by the Turkish government without much difficulty, but they hoped that the savage measures of repression which the Turks were sure to employ might lead to the active intervention of the powers. Austria, Germany, France, and Russia were thus enabled to make a show of their "concern" for the Armenians, which the "atrocities" of 1876 had led to the political emancipation of Bulgaria. In due course—1893-1896—the expected atrocities took place, in the form of wholesale massacres in Constantinople and various towns of Asia Minor. The sultan was subjected to diplomatic pressure and threatened with more efficient means of coercion. In the diplomatic campaign England took the lead, and was warmly supported by Italy, but Germany, Austria and France showed themselves lukewarm, not to say indifferent, and Russia, departing from her traditional policy of protecting the Christians of Turkey, vetoed the employment of force for extracting concessions from the sultan. In these circumstances the Porte naturally confined itself to making a few reforms on paper, which were never carried out. Thus the last state of the Armenians was worse than the first, but the so-called European concert was maintained, and the danger of a great European war was averted.

The next attempt to raise the Eastern Question was made by the Greeks. In 1896 a semi-secret society called the Ethniké Heiratia began a Panhellenic agitation, and took advantage of one of the periodical insurrections in Crete to further its projects. In February 1897 the Cretan revolutionary committee proclaimed the annexation of the island to the Hellenic kingdom, and a contingent of Greek regular troops landed near Canea under the command of Colonel Vassos to take possession of the island in the name of King George. The powers, objecting to this arbitrary proceeding, immediately occupied Canea with a mixed force from the ships of war which were there at the time, and summoned the Greek government to withdraw its troops. The summons was disregarded, and the whole of the Greek army was mobilized on the frontier of Thessaly and Epirus. In consequence of a raid into Turkish territory the Porte declared war on the 17th of April, and the short campaign ended in the defeat of the Greeks. The powers intervened to put an end to the hostilities, and after prolonged negotiations a peace was concluded by which Greece had to consent to a strategical rectification of frontier and to pay a war indemnity of £4,000,000. Thus a second time the European concert acted in the interests of peace, but it did not stand the strain of the subsequent efforts to solve the Cretan Question. Finding the Turks less conciliatory after their military success, and being anxious to remain in cordial relations with the Porte, Germany withdrew from further co-operation with the powers, and Austria followed her example. They did not, however, offer any active opposition, and the question received a temporary solution by the appointment of Prince George, second son of the king of Greece, as high commissioner and governor-general of the island. (See CRETE.)
of colonial powers, would generally be involved; and as the unappropriated portions of the earth’s surface at the beginning of the period under discussion were to be found chiefly in Africa, it was in the Dark Continent that the conflicts of interests mostly took place. England’s chief competitors were France and Germany. Her traditional policy, except in the south of the continent, where the conditions of soil and climate were favourable to European colonists, had been purely commercial. She had refrained from annexation of territory, as involving too much expenditure and responsibility, and confined her protection to the trading stations on the coast. When France came into the field this policy had to be abandoned. The policy of France was also commercial in a certain sense, but the methods she adopted were very different. She endeavoured to bring under her authority, by annexation or the establishment of protectorates, the largest possible extent of territory, in order to increase her trade by a system of differential tariffs; she encroached on the hinterland of British settlements, and endeavoured to direct artificially the native inland trade towards her own ports. A glance at the map of the African West Coast will suffice to show the success with which this policy has been carried out. When the danger was clearly seen, the danger, all that could be done was to prevent further encroachments by likewise annexing territory. The result is shown in the article Africa: § 5. In her dealings with France about the partition of Africa, England was generally conciliatory, but she was always inflexible in guarding carefully the two entrances to the Mediterranean. There was, therefore, a permanent danger of conflict in Egypt and Morocco. When England in 1882 considered it necessary to suppress the Arab insurrection, she invited France to co-operate, but the French government declined, and left the work to be done by England alone. England had no intention of occupying the country permanently, but she had to take precautions against the danger of French occupation after her withdrawal, and these precautions were embodied in an Anglo-Turkish convention signed at Constantinople in May 1887. France prevented the ratification of the convention by the sultan, with the result that the British occupation has been indefinitely prolonged. She still clung persistently, however, to the hope of obtaining a predominant position in the valley of the Nile, and she tried to effect her purpose by getting a permanent hold on the upper course of the river. The effort which she made in 1898 to attain this end, by simultaneously despatching the Marchand mission from her Congo possessions and inviting the emperor Menlek of Abyssinia to send a force from the east to join hands with Major Marchand at Fashoda, was defeated by the overthrew of the Khalifa and the British occupation of Khartum. For a few days the two nations seemed on the brink of war, but the French government, receiving no encouragement from St Petersburg, consented to withdraw the Marchand mission, and a convention was signed defining the respective spheres of influence of the two countries.

In Morocco the rivalry between the two powers was less acute but not less persistent and troublesome. France aspired to incorporate the sultanate with her north African possessions, whilst England had commercial interests to defend and was firmly resolved to prevent France from getting unchallenged possession of Acre on the coast of the Straits of Gibraltar. As in Egypt, so in Morocco the dangers of conflict were averted, in 1904, by a general agreement, which enabled France to carry out in Morocco, as far as England was concerned, her policy of pacific penetration, but debarred her from erecting fortifications in the vicinity of the straits. Germany thereafter strongly opposed French claims in Morocco, but after a period of great tension, and the holding of an ineffectual conference at Algiers in 1906, an understanding was come to in 1909 (see Morocco: History).

With Germany likewise, from 1880 onwards, England had some diplomatic difficulties regarding the partition of Africa, but they never reached a very acute phase, and were ultimately settled by mutual concessions. By the arrangement of 1890, in which several of the outstanding questions were solved, Heligoland was ceded to Germany in return for concessions in East Africa. A conflict of interests in the southern Pacific was amicably arranged by the Anglo-German convention of April 1886, in which a line of demarcation was drawn between the respective spheres of influence in the islands to the north and east of the Australian continent, and by the convention of 1890, in virtue of which Germany gained possession of Samoa and renounced in favour of England all pretensions to the Tonga Archipelago.

In Asia the tendencies of the European powers to territorial expansion, and their desire to secure new markets for their trade and industry, have affected from time to time their mutual relations. More than once England and Russia have had disputes about the limits of their respective spheres of influence in central Asia, but the causes of friction have steadily diminished as the work of frontier delimitation has advanced. The important agreement of 1872–1873 was supplemented by the protocol of the 22nd of July 1887 and the Pärmi delimitation of 1895, so that the Russo-Afghan frontier, which is the dividing line between the Russian and British spheres of influence, has now been carried right up to the frontier of the Chinese empire. The delimitation of the English and French spheres of influence in Morocco was provided for in 1886. France endeavoured to get a footing on the Upper Irrawaddy, the hinterland of British Burma, and England replied in the following year by annexing the dominions of King Thebaw, including the Shan States as far east as the Mekong. Thereupon France pushed her Indo-Chinese frontier westwards, and in 1893 made an attack on the kingdom of Siam, which very nearly brought about a conflict with England. After prolonged negotiations an arrangement was reached and embodied in a formal treaty (January 1896), which clearly foreshadows a future partition between the two powers, but guarantees the independence of the central portion of the kingdom, the Valley of the Menam, as a buffer-state. Farther north, in eastern China, the aggressive tendencies and mutual rivalries of the European powers have produced a problem of a much more complicated kind. Firstly Germany, then Russia, next England, and finally France took portions of Chinese territory, under the thin disguise of long leases. They thereby excited in the Chinese population and government an intense anti-foreign feeling, which produced the Boxer movement and culminated in the attack on the foreign legations at Pekin in the summer of 1900. (See China: History.)

In 1899–1901 the relations of the European powers were disturbed by the Boer War in South Africa. In nearly every country of Europe popular feeling was much excited against England, and in certain influential quarters the idea was entertained of utilizing this feeling for the formation of a coalition against the British empire; but in view of the decided attitude assumed by the British government, and the loyal enthusiasm displayed by the colonies, no foreign government ventured to take the initiative of intervention, and it came gradually to be recognized that no European state had any tangible interest in prolonging the independence and maladministration of the Boer republics.

One permanent factor in the history of Europe after the war of 1870–71 was the constant increase of armaments by all the great powers, and the proportionate increase of taxation. The fact made such an impression on the young emperor of Russia, Nicholas II., that he invited the powers to consider whether the further increase of the burden thereby imposed on the nations might not be arrested by mutual agreement; and a conference for this purpose as convened at the Hague (May 18–July 29, 1899), but the desirable object in view was not attained. (See Arbitration, International.)

Though neither the first Hague Conference nor the second, which met in 1907, did much to fulfil the expectations of those who hoped for the establishment of a system which should guarantee the world against the disasters of war, they undoubtedly tended to create a strong public opinion in favour of peaceful methods in the solution of international problems which has not been without its effect. Any attempt to organize the concert of the powers must always
fail, as it failed in the early part of the 19th century, so long as the spirit of national and racial rivalry is stronger than the consciousness of common interests; and the early years of the century showed no diminution, but rather an accentuation of this rivalry. The court of arbitration established at the Hague early in 1901 may deal effectively with questions as to which both parties desire a modus vivendi, and the pacific efforts of King Edward VII., which did so much to prevent misunderstandings likely to lead to war, resulted from 1903 onwards in a series of arbitration treaties between Great Britain and other powers which guaranteed the Hague court an effective activity in such matters. But more perilous issues, involving deep-seated antagonisms, have continued to be dealt with by the methods of old diplomacy backed by the armed force of the powers. How far the final solution of such problems has been helped or hindered by the general reluctance to draw the sword must for some time to come remain an open question. Certainly, during the early years of the 20th century, many causes of difference which a hundred years earlier would assuredly have led to war, were settled, or at least shelved, by diplomacy. Of these the questions of Crete, of Armenia, and of contested claims in Africa have already been mentioned. Other questions of general interest which might have led to war, but which found a peaceful solution, were those of the separation of Norway and Sweden, and the rivalry of the powers in the northern seas. In October 1893 Sweden formally recognized the separate existence of Norway (see Norway: History and Sweden: History). On the 23rd of April 1908 were signed the "Declarations"; the one, signed by the four Baltic littoral powers, recognized "in principle" the maintenance of the territorial status quo in that sea; the other, to which Great Britain, France, Germany, Denmark, Sweden and Holland were the parties—sanctioned a similar principle in regard to the North Sea. These were followed, in June of the same year, by two agreements intended to apply the same principles to the southern European waters, signed by France and Spain and Great Britain and Spain respectively. Another agreement, that signed between Russia and Great Britain in 1907 for the delimitation of their spheres of influence in Persia and the northern borders of the Indian empire, though having no direct relation to European affairs, exercised considerable influence upon them by helping to restore the international prestige of Russia, damaged by the disasters of the war with Japan and the internal disturbances that followed. The new cordial understanding between the British and Russian governments was cemented by the meeting of King Edward VII. and the emperor Nicholas II. at Reval in June of 1908.

More perilous to European Peace, however, than any of these issues was the perilous event in Macedonia, which threatened sooner or later to open up the whole Eastern Question once more in its acutest form. The situation was due to the internecine struggle of the rival Balkan races—Greek, Bulgarian, Servian—to secure the right to the reversion of territories not yet derelict. But behind these lesser issues loomed the great secular rivalries of the powers, and beyond these again the vast unknown forces of the Mahomedan world, ominously stirring. The very vastness of the perils involved in any attempt at a definitive settlement compelled the powers to accept a compromise which, it was hoped, would restore tolerable conditions in the wretched country. But the "Mürzsteg programme," concerted between the Austrian and Russian emperors in 1903, and imposed upon the Porte by the diplomatic pressure of the great powers, did not produce the effects hoped for. The hideous tale of massacres of helpless villagers by organized Greek bands, and of equally hideous, if less wholesale, reprisals by Bulgarian bands, grew rather than diminished, and reached its climax in the early months of 1908. The usefulness of the new gendarmerie, under European officers, which was to have co-operated with the Ottoman authorities in the restoration of order, was from the outset crippled by the passive obstruction of the Turkish government. The sultan, indeed, could hardly be blamed for watching with a certain cynical indifference the mutual slaughter of those "Christians" whose avowed ideal was the overthrow of Mahomedan rule, nor could he be expected to desire the smooth working of a system against which he had protested as a violation of his sovereign rights. In 1908 the powers were still united in bringing pressure to bear on the Porte to make it accept the proposal of Great Britain to follow the precedent of the Lebanon and cede the administration of Macedonia to a Mussulman governor appointed by the sultan, but removable only by consent of the powers, met with little favour either at Constantinople or among the powers whose ulterior aims might have been hampered by such an arrangement.

Such was the condition of affairs when in October 1908 the revolution in Turkey altered the whole situation. The easy and apparently complete victory of the Young Turks, and the re-establishment without a struggle of the constitution which had been in abeyance since 1876, took the whole world by surprise, and not least those who believed themselves to be most intimately acquainted with the conditions prevailing in the Ottoman empire. The question of the Near East seemed in fair way of settlement by the action of conflicting races themselves, who in the enthusiasm of newfound freedom appeared ready to forget their ancient internecine feuds and to fraternize on the common ground of constitutional liberty (see Turkey: History). By the European powers the proclamation of the constitution was received, at least outwardly, with unanimous approval. General enthusiasm being expressed for the singular moderation and self-restraint shown by the Turkish leaders and people. Whatever views, however, may have been openly expressed, or secretly held, as to the revolutionary process so far as it affected the Ottoman empire itself, there could be no doubt that its effects on the general situation in Europe would be profound. These effects were not slow in revealing themselves. On the 4th of October Prince Ferdinand of Bulgaria proclaimed himself king (tsar) of the Bulgarians; and two days later the emperor Francis Joseph issued a rescript announcing the annexation of Bosnia and Herzegovina to the Habsburg monarchy (see Bulgaria: History and Bosnia and Herzegovina: History). Whatever cogent reasons there may have been for altering the status of these countries in view of the changed conditions in Turkey, there could be no doubt that the method employed was a violation of the public law of Europe. By the declaration of London of 1877, to which Austria-Hungary herself had been a principal party, it had been laid down that "contracting powers could only rid themselves of their treaty engagements by an understanding with their co-signatories." This solemn reaffirmation of a principle on which the whole imposing structure of international law had, during the last century, been laboriously built up was now cynically violated. The other powers, confronted with the j'ai accompli, protested; but the astute statesman who had staked his reputation as foreign minister of the Dual Monarchy on the success of this coup had well gauged the character and force of the opposition he would have to meet. Baron von Aehrenthal, himself more Slav than German, in spite of his name, had served a long apprenticeship in diplomacy at Belgrade and St Petersburg; he knew how fully he could rely upon the weakness of Russia, and that if Russian Pan-Slav sentiment could be cowed, he need fear nothing from the resentment of the Servians. He was strong, too, in the moral and—in case of need—the material support of Germany. With Germany behind her, Austria-Hungary had little to fear from the opposition of the powers of the triple entente, Great Britain, France and Russia. This diagnosis of the situation was justified by the event. For months, indeed, Europe seemed on the verge of a general war. During the autumn the nationalist excitement in Servia and Montenegro rose to fever-heat, and Austria responded by mobilizing her forces on the frontiers and arming the Catholic Bosnians as a precaution against a rising of their Orthodox countrymen. Only the winter seemed to stand between Europe and a war bound to become general, and men looked forward with apprehension to the melting of the snows. It is too early as yet to write the history of the diplomatic activities by which this disaster was avoided. Their general
outlaw, however, is clear enough. The protests of Turkey at a violation of treaty rights, doubly resented as likely to damage the prestige of the new constitutional régime, were sympathetically received by the powers of the triple entente. An international conference was at once suggested as the only proper authority for carrying out any modifications of the treaty of Berlin necessitated by the new conditions in Turkey; the right of Austria-Hungary to act on her own initiative was strenuously denied; Bulgarian independence and Prince Ferdinand's title of king were meantime refused recognition. In the assertion of these principles Great Britain, Russia and France were united. Germany, on the other hand, maintained an attitude of reserve, though diplomatically "correct"; she accepted the principle of a conference, but made her consent to its convocation conditional on that of her ally Austria-Hungary. But the latter refused to agree to any conference in which the questions at issue should be reopened; the most that she would accept was a conference summoned merely to register the fait accompli and to arrange "compensations" not territorial but financial.

For a while it seemed as though Baron Achenthal's ambition had o'released itself. The reluctance of the Russian government, conscious of its military and political weakness, to take extreme measures seemed likely to be overborne by the Pan-Slav enthusiasm of the Russian principles received by the powers of the triple entente. They placed him in an impasse from which it would be difficult to extricate himself, save at an expense greater than that on which he had calculated. At this point Germany, conscious throughout of holding the key to the situation, intervened with effect. Towards the end of March 1900 the German ambassador at St Petersburg, armed with an autograph letter from the emperor William II., had an interview with the tsar. What were the arguments he used is not known; but the most powerful are supposed to have been the German forces which had been mobilized on the Polish frontier. In any case, the result was immediate and startling. Russia, without previous discussion with her allies, dissociated herself from the views she had hitherto held in common with them, and accepted the German-Austrian standpoint. All question of a conference was now at an end; and all that the powers most friendly to Turkey could do was to persuade her to make the best of a bad bargain. The Ottoman government, preoccupied with the internal questions which were to issue in the abortive attempt at counter-revolution in April, was in no condition to resist friendly or unfriendly pressure. The principle of a payment in compensation for the surrender of the sultan over these provinces was accepted,1 and Bulgarian independence under King Ferdinand was recognized on the very eve of the new victory of the Young Turks which led to the deposition of Abd-ul-Hamid II. and the proclamation of Sultan Mahammed V. (see Turkey: History.)

The change made by these events in the territorial system of Europe was of little moment. A subject principality, long practically independent, became a sovereign state; the Almanach de Gotha was enriched with a new royal title; the sentiment of the Bulgarian people was gratified by the restoration of their historic tsardom. Two provinces long annexed to the Habsburg monarchy de facto became de jure, and the vision of a Serb empire with a free outlet to the sea, never very practicable, was finally dissolved. Of vastly greater importance were the moral and international issues involved. The whole conception of an effective concert of Europe, or of the World, based on the supposed sacred obligation of treaties and the validity of international law, was revealed, suddenly and brutally, as the baseless fabric of a dream. The most momentous outcome of the international debates caused by Austria's high-handed action was the complete triumph of Bismarck's principle that treaties cease to be valid "when the private interest of those who lie under them no longer reinforces the text." Henceforth, it was felt, no reaffirmation of a principle of international comity and law, so successfully violated, could serve to disguise the brutal truth that in questions between nations, in the longestablished custom and law of nations, there is no absolute power. The whole submission preached by Tolstoy and his disciples and Napoleon's dictum that "Providence is with the big battalions." In Great Britain, especially, public opinion was quick to grasp this truth. It was realized that it was the immense armed power of Germany that had made her the arbiter in a question vitally affecting the interests of all Europe. Germany alone emerged from the crisis with prestige enormously enhanced; for without her intervention Austria could not have resisted the pressure of the powers. The cry for disarmament, encouraged by the action of Sir Henry Campbell-Bannerman's government, suddenly died down in England; and the agitation in favour of an increased ship-building programme, that followed the revelation by the first lord of the admiralty (April 1900) of Germany's accelerated activity in naval construction, showed that public opinion had been thoroughly awakened to the necessity of maintaining for Great Britain her maritime supremacy, on which not only her position in Europe but the existence of her over-sea empire depended.

BIBLIOGRAPHICAL NOTE.—(1) Bibliographies.—List of the principal works on the history of the various European countries, and of their colonies, has been printed in this Encyclopaedia; these articles (see also those appended to the articles Papacy; Church History; Diplomacy; Crusades: Feudalism, &c.), for the sources of the medieval history of Europe see Ulysses Chevalier's Répertoire des ouvrages antérieurs ... (2nd ed., Paris, 1877, &c.), and the Bio-Bibliographie (Paris, 1877, &c.), which with certain limitations (notably as regards the Slav, Hungarian and Scandinavian countries) gives references to published documents for all names of people, however obscure, occurring in medieval history. In 1894 M. von Waetzoldt published under the somewhat misleading title of Topo-Bibliographie, intended as a compendious guide to the places, institutions, &c., of the middle ages; though very useful, this is by no means so complete as the Répertoire des ouvrages antérieurs ... ; and in 1901 H. Bedzi (2nd ed., Berlin, 1895-1906) gives a complete catalogue of all the annals, chronicles and other historical works which appeared in Europe between the years 375 and 1500 and have since been printed, with short notes on their value and significance, and references to critical works upon them. See also the article Record. For authorities on the history of Europe from the end of the 15th to the 19th centuries inclusive the excellent bibliographies appended to the volumes of the Cambridge Modern History are invaluable.

(2) Works.—Of general works the most important are the Histoire générale du 17e siècle à nos jours, published under the direction of E. Lavisse and A. Rambaud (Paris, 1894, &c.), in 12 vols., covering the period 1650-1789, while also avoiding the errors of Ranke's Weltpolitische Geschichte (Leipzig, 1881, &c.), in 9 vols., covering (i.) the oldest group of nations and the Greeks; (ii.) the Roman Republic; (iii.) the ancient Roman Empire; (iv.) the East Roman Empire and the origin of the modern Greek nation; (v.) the Auto-Balkan world-power and the empire of Charlemagne; (vi.) dissolution of the Carolingian and foundation of the German empire; (vii.) the new phase of the Roman empire and the hierarchy under Gregory VII.; (viii.) crusades and papal world-power (1250 and following period), by A. Hazen (1901); while the International encyclopedia (14th and 15th centuries). To this may be added Ranke's works on special periods: e.g. Die Franken und Völker von Süd-Europa im 10ten und 11ten Jahrhundert (2nd ed., Leipzig, 1837-1839); Geschichte der deutschen Geschichte (Leipzig, 1837, &c., 6 vols., 1842); the Geschichte des 18ten Jahrhunderts (1848, &c., 5 vols.; 2nd ed., 1874, Eng. trans. 1887). In English the most important general work is the Cambridge Modern History (1903, &c.), produced by the collaboration of English and foreign scholars, and covering the period from 1745 to 1900. This work has been followed by The Historians' History of the World, edited by Dr H. Smith Williams (1908), is a compilation from the works of eminent historians of all ages, and the value of its various parts is therefore that of the individuals who have contributed to it. To this it makes the work accessible to English readers many foreign or obscure sources which would otherwise have remained closed to the general reader. It also contains essays by notable modern scholars on the principal events and movements of the modern world: it contains a large number of treaties, &c., not included as yet in other collections, and comprehensive bibliographies. On a less ambitious scale are the volumes of the Periods of European History series (London, 1893, &c.): Period I. The Dark Ages (476-1050), by W. H. C. (1903); Period II. The Empires and the Papacy, 1050-1277, by T. F. Tout (1898); Period III. The Close of the Middle Ages, 1274-1495, by R. Lodge (1901); Europe in the 16th Century, 1500-1568, by A. H. Johnson (1897); The Ascent of France, by H. O. Wakeman (1894); and Period IV. The Rise of Nationalism, by H. More Stephens (1893); Modern Europe, by W. Allison Phillips (1901),

1 The Austro-Turkish protocol had been signed at Constantinople on the 5th of March; it was now ratified by the Turkish parliament on the 5th of April.
EUROPID—EUSEBIUS

EUSDEN, LAURENCE (1688—1730). English poet, son of the Rev. Laurence Eusden, rector of Spofforth, Yorkshire, was baptized on the 9th of September 1688. He was educated at St Peter's School, York, and Trinity College, Cambridge. He became a minor fellow of his college in 1711, and in the next year was admitted to a full fellowship. He was made poet laureate in 1718 by the lord chancellor, the duke of Newcastle, as a reward for a flattering poem on his marriage. He was rector of Coningsby, Lincolnshire, where he died on the 27th of September 1730. His name is less remembered by his translations and gratulatory poems than by the numerous satirical allusions of Pope, e.g. “Know, Eusden thirsts no more for sack or praise; He sleeps among the duff of anciant days.”

Dunciad, bk. 1. l. 293—294.

EUSEBIUS (Gr. Εὐσεβίος, from εὐσέβης, pious, cf. the Latin name Pius), a name borne by a large number of bishops and others in the early ages of the Christian Church. Of these the most important are separately noticed below. No less than 25 saints of this name (sometimes corrupted into Euseus, Euruge, Usoge, Usuge, Uruge and St Sebis) are venerated in the Roman Catholic Church, of whom 23 are included in the Bollandists (see C. Anastassi, fig. 340).”

EUSEBIUS, bishop of Samosata (d. 380), played a considerable part in the later stages of the Arian controversy in the East. He is first mentioned among the Homoean and Homoeusian bishops who in 363 accepted the Homousian formula at the synod of Antioch presided over by Meletius, with whose views he seems to have identified himself (see MELETIUS OF ANTIOCH). According to Theodoret (§ 4, 8) he was killed at Doliche in Syria, where he had gone to consecrate a bishop, by a stone cast by an Arian woman. He thus became a martyr, and found a place in the Catholic calendar (see the article by Loofs in Herzog—Hauck, Realencycl., ed. 1898, p. 920).

EUSEBIUS OF LAODICEA, though not included among the saints, was noted for his saintly life. He was an Alexandrian by birth, and gained so great a reputation for his self-denial and charity that when in 262 the city of Laodicea was besieged by the troops of the emperor Gallienus he obtained permission, together with Anatholius, from their commander Theocius, to lead out the non-combatants, whom he tended “like a father and physician.” He went with Anatholius to Syria, and took part in the controversy against Paul of Samosata, bishop of Antioch. He became bishop of Laodicea, probably in the following year (263), and died some time before 268. His friend Anatholius succeeded him as bishop in the latter year (see the article by E. Hennecque in Herzog—Hauck, v. 619).

EUSEBIUS, bishop of Rome for four months under the emperor Maxentius, in 309 or 310. The Christians in Rome, divided on the question of the reconciliation of apostates, on which Eusebius held the milder view, brought forward a competitor, Heraclius. Both competitors were expelled by the emperor, Eusebius dying in exile in Sicily. He was buried in the cemetery of St Calixtus at Rome; and the extant epitaph, in eight hemistich lines, set up here by his successor Damasus, contains all the information there is about his life.

EUSEBIUS [OF CAESAREA] (c. 260—c. 340), ecclesiastical historian, who called himself Eusebius Pamphili, because of his devotion to his friend and teacher Pamphilus, was born probably in Palestine between a.d. 260 and 265, and died as bishop of Caesarea in the year 339 or 340. We know little of his youth beyond the fact that he became associated at an early day with Pamphilus, secretary of the Church of Caesarea, and founder of a theological school there (see Hist. Ecc. vii. 32). Pamphilus gathered about him a circle of earnest students who

---

EUROPID, a metallic chemical element, symbol Eu, atomic weight 152.0 (O=16). The oxide EuO, occurs in very small quantity in the minerals of the rare earths, and was first obtained in 1896 by E. A. Demarqy from Lecoq de Boisbaudran’s samarium; G. Urbain and H. Lacombe in 1904 obtained the pure salts by fractional crystallization of the nitric acid solution with magnesium nitrate in the presence of bismuth nitrate. The salts have a faint pink colour, and show a faint absorption spectrum; the spark spectrum is brilliant and well characterized.

EURYDICE (Εὐρυδίκη, Gr. mythology, the Greek name of Oseis or Osiris, p. 168). She was the daughter of Nereus and Doris, and died from the bite of a serpent when fleeing from Aristaeus, who wished to offer her violence (Virgil, Georgics, iv. 454—527; Ovid, Metam. x. 1 ff.).

EURYMEN, one of the Athenian generals during the Peloponnesian War. In 426 B.C. he was sent by the Athenians to intercept the Peloponnesian fleet which was on the way to attack Corcyra. On his arrival, finding that Nicostratus with a small squadron from Naupactus had already placed the island in security, he took the command of the combined fleet, which, owing to the absence of the enemy, had no chance of distinguishing itself. In the following summer, in joint command of the land forces, he ravaged the district of Tanagra; and in 425 he was appointed, with Sophocles, the son of Sostratides, to the command of an expedition destined for Sicily. Having touched at Corcyra on the way, in order to assist the democratic party against the oligarchical exiles, but without taking any steps to prevent the massacre of the latter, Eurymen proceeded to Sicily. Immediately after his arrival a pacification was concluded by Hermocrates, to which Eurymen and Sophocles were induced to agree. The terms of the pacification did not, however, satisfy the Athenians, who attributed its conclusion to bribery; two of the chief agents in the negociations were banished from Athens. Eurymen was sentenced to pay a heavy fine.

In 414 Eurymen, who had been sent with Demosthenes to reinforce the Athenians at the siege of Syracuse, was defeated and slain before reaching land (Thucydides iii. iv., vii.; Diod. Sic. xiii. 8, 11, 13).
devoted themselves especially to the study of the Bible and the transcription of Biblical codices, and also to the defence and spread of the writings of Origen, whom they regarded as their master. Pamphilus had a magnificent library, which Eusebius made diligent use of, and a catalogue of which he published in his lost Life of Pamphilus (Hist. Eccl. vi. 32). In the course of the Diocletian persecution, which broke out in 303, Pamphilus was imprisoned for two years, and finally suffered martyrdom. During the time of his imprisonment (307–309) Eusebius distinguished himself by assiduous devotion to his friend, and assisted him in the preparation of an apology for Origen's teaching (Hist. Eccl. vi. 33), the first book of which survives in the Latin of Rufinus (printed in Routh's Religiae sacrae, iv. 339 sq., and in Lommatzsch's edition of Origen's Works, xxiv. p. 293 sq.). After the death of Pamphilus Eusebius withdrew to Tyre, and later, while the Diocletian persecution was still raging, went to Egypt, where he seems to have been imprisoned, but soon released. He became bishop of Caesarea between 313 and 315, and remained such until his death. The patriarchate of Antioch was offered him in 331, but declined (Vita Constantini, iii. 59 sq.).

Eusebius was a very important figure in the church of his day. He was not a great theologian, but he could express his theological belief with the utmost force and power. His writing is characterized by the dignity of style and the force of argument. He also had a healthy respect for the authority of the earlier writers, and always consulted them, when necessary. His work is a valuable source for the history of the church, and his conclusions are not always open to objection.

In the beginning he was the most influential man present, but he was finally forced to yield to the Alexandrian party, and to, vote for a creed which completely repudiated the position of the Arians, with whom he had himself been hitherto more in sympathy than with the Alexandrians. He was placed in a difficult predicament by the action of the council, and his letter to the Caesarean church explaining his conduct is exceedingly interesting and instructive (see Socrates, Hist. Eccl. i. 8, and cf. McGiffert's translation of Eusebius' Church History, p. 15 sq.). To understand his conduct, it is necessary to look briefly at his theological position. By many he has been called an Arian, by many his orthodoxy has been defended. The truth is, that he was a distinguished and profound thinker, and that his work is full of valuable material. The first preceded the outbreak of the Arian controversy, when, as might be expected in a follower of Origen, his interest was anti-Sabellian and his emphasis chiefly upon the subordination of the Son of God. In his works written during this period (for instance, the Prooemium and Demonstratio evangelica), as in the works of Origen himself and other ante-Nicene fathers, expressions occur looking in the direction of Ariusism, and others looking in the opposite direction. The second stage began with the outbreak of the controversy in 318, and continued until the Nicene Council. During this period he took the side of Arian in the dispute with Alexander of Alexandria, and accepted what he understood to be the position of Arian and his supporters, who, as he supposed, taught both the divinity and subordination of the Son. It was natural that he should take this side, for in his traditional fear of Sabellianism, in which he was one with the followers of Origen in general, he found it difficult to approve the position of Alexander, who seemed to be doing away altogether with the subordination of the Son. And, moreover, he believed that Alexander was successively swelling the teaching of Arian and doing him great injustice (cf. his letter to Alexander and Euphrosine preserved in the proceedings of the second council of Nicaea, Act. vi. tom. 5: see Mansi's Concilia, iii. 316 sq.; English translation in McGiffert, op. cit. p. 70).

Meanwhile at the council of Nicaea he seems to have discovered that the Alexandrians were right in claiming that Arian was carrying his subordinationism so far as to deny all real divinity to Christ. To this length Eusebius himself was unwilling to go, and so, convinced that he had misunderstood Arian, and that the teaching of the latter was impelling the historic belief in the divinity of Christ, he gave his support to the opposition, and voted for the Nicene Creed, in which the teachings of the Arians were repudiated. From this time on he was a supporter of Nicene orthodoxy over against Arianism (cf. e.g., his Contra Marcellum, De ecclesiastica theologa, and Theophilus). But he never felt in sympathy with the extreme views of the Athanasian party, for they seemed to him to savour of Sabellianism, which always remained his chief dread (cf. his two works against Marcellus of Ancya). His personal friends, moreover, were principally among the Arians, and he was more closely identified with them than with the supporters of Athanasius. But he was always a man of peace, and while commonly counted one of the opponents of Athanasius, he did not take a place of leadership among them as his position and standing would have justified him in doing, and Athanasius never spoke of him with bitterness as he did of other prominent men in the party. (For a fuller description of the development of Eusebius' Christology and of his attitude throughout the Arian controversy, see McGiffert, op. cit. p. 11 sq.)

Eusebius was one of the most voluminous writers of antiquity, and his labours covered almost every field of theological learning. If we look in his works for brilliancy and originality we shall be disappointed. He was not a creative genius like Origen or Augustine. His claim to greatness is largely his laboriousness, and the great store he always many of whom still retain valuable. His exegesis is superior to that of most of his contemporaries, and his apologetic is marked by fairness of statement, breadth of treatment, and an instinctive appreciation of the difference between important and unimportant points. His style, it is true, is involved and obscure, often rambling and incoherent. This quality is due in large part to the desultory character of his thinking. He did not always clearly define his theme before beginning to write, and he failed to subject what he produced to a careful revision. Ideas of all sorts poured in upon him while he was writing, and he was not always able to resist the temptation to insert them whether pertinent or not. His great learning is evident everywhere, but he is often its slave rather than its master. It is as an historian that he is best known, and to his History of the Christian Church he owes his fame and his familiar title "The Father of Church History." This work, which was published in its final form in ten books in 324, was the most important ecclesiastical history produced in ancient times. The reasons leading up to the great undertaking, in which Eusebius had no predecessors, were in part historical, in part apologetic. He believed that he was living at the beginning of a new age, and he felt that it was a fitting time, when the old order of things was passing away, to put on record for the benefit of posterity the great events which had occurred during the generations that were past. He thus wrote, as any historian might, for the information and instruction of his readers, and yet he had all the time an apologetic purpose, to exhibit to the world the history of Christianity as a proof of its divine origin and efficacy. His plan is stated at the very beginning of the work:

"It is my purpose to write an account of the successes of the holy Apostles as well as of the times which have elapsed from the day of our Saviour to our own; to relate how many and important events are said to have occurred in the history of the church; and to mention those who have governed and presided over the church in the most prominent parishes, and those who in each generation have proclaimed the divine word either orally or in writing. It is my intention, moreover, to recount the misfortunes which immediately came on the whole Jewish nation in consequence of their plots against our Saviour, and to record the ways and things in which the divine word has been attacked by the Gentiles, and to describe the character of those who at various periods have contended for it in the face of blood and tortures, as well as the confessions which have been made in our own day, and the gracious and kindly succour which our Saviour has accorded them all."

The value of the work does not lie in its literary merit, but in the wealth of the materials which it furnishes for a knowledge
EUSEBIUS

of the early church. Many prominent figures of the first three centuries are known to us only from its pages. Many fragments, priceless on account of the light which they shed upon a subject of far-reaching consequence, have been preserved in it also. Eusebius fails to appreciate the significance of the events which he records; in many cases he draws unwarranted conclusions from the given premises; he sometimes misinterprets his documents and misunderstands men and movements; but usually he presents us with the material upon which to form our own judgment, and if we differ with him we must at the same time thank him for the data that enable us independently to reach other results. But the work is not merely a thesaurus, it is a history in a true sense, and it has an intrinsic value of its own, independent of its quotations from other works. Eusebius possessed extensive sources of knowledge no longer accessible to us. The number of books referred to as read is enormous. He also had access to the archives of state, and gathered from them information beyond the reach of most. But the value of his work is due, not simply to the sources employed, but also to the use made of them. Upon this matter there has been true, some diversity of opinion among modern scholars, but it is now generally admitted, and can be abundantly shown, that he was not only diligent in gathering material, but also far more thorough-going than most writers of antiquity in distilling between truth and untruth. This becomes especially plain in knowing his ignorance, scrupulous in indicating his authorities in doubtful cases, less credulous than most of his contemporaries, and unfaithfully honest. His principal faults are his carelessness and inaccuracy in matters of chronology, his lack of artistic skill in the presentation of his material, his desultory method of treatment, and his failure to look below the surface and grasp the real significance and vital connection of events. He commonly regards an occurrence as sufficiently accounted for when it is ascribed to the activity of God or of Satan. But in spite of its defects the Church History is a monumental work, which need only be compared with its continuations by Socrates, Sozomen, Theodoret, Rufinus, and others, to be appreciated at its true worth.

In addition to the Church History we have from Eusebius' pen a Chronicle in a two books (c. 303; later continued down to 325), the first containing an epitome of universal history, the second chronological tables exhibiting in parallel columns the royal succession in different nations, and accompanied by notes marking the dates of historical events. A revised edition of the second book with a continuation was published by Witzschard in 1819, by Jerome, and this, together with some fragments of the original Greek, was our only source for a knowledge of the Chronicle until the discovery of an Armenian version of the whole work, which was published by H. de Scheurer in 1878 (Lat. & Gr.). A monograph of the Life of Constantine, the Oration in Praise of Constantine, and the Oration in Praise of Constantine, with elaborate notes; by Burton (1838; a handy reprint in a single volume by Bright, 1881), and by many others. The work is two large volumes of Synopsis and Questions in the Berlin Academy's Greek Fathers, of which the first half has appeared, accompanied by the Latin version of Rufinus edited by Mommsen. The history was early put into Syriac (edited by Bedjan, Leipzig, 1886), into Armenian by Nalbandian (1852), into Latin, (edited by Dijarian, Venice, 1877), and Latin, and has been translated into many modern languages, the latest English version being that of McGregor, in the Nicene and Post-Nicene Fathers, second series, 1895. A monograph of the Opinion of the primitive church is by Schoene in two volumes (Berlin, 1866–1875). The Life of Constantine and the Oration in Praise of Constantine are published by Valesius, Heinichen and others in their editions of the Church History. A continuation of the first volume of the Berlin Academy's edition (ed. by Heikel), in Hannam's Biblisch-Theologisch Lexicon, 1877, pp. 106 sq.; and Bardenhewer's Patrologie, p. 2206 f. The many...
special discussions of Eusebius' separate works, particularly of his Church History, and of his character as a historian, cannot be referred to here. Elaborate bibliographies will be found in McGiffert's translation, and in Preuschen's article in Herzog-Hauck. (A.C. McG.)

EUSEBIUS [OF EMES] (d. c. 360), a learned ecclesiastical of the Greek church, was born at Edessa about the beginning of the 4th century. After receiving his early education in his native town, he studied theology at Caesarea and Antioch and philosophy and science at Alexandria. Among his teachers were Eusebius of Caesarea and Patrophilus of Scythopolis. The reputation he acquired for learning and eloquence led to his being offered the see of Alexandria in succession to the deposed Athanasius at the beginning of 339, but he declined, and the council (of Antioch) chose Gregory of Cappadocia, "a fitter agent for the rough work to be done." Eusebius accepted the small bishopric of Emessa (the modern Homs) in Phoenicia, but his powers as mathematician and astronomer led his flock to accuse him of practising sorcery, and he had to flee to Laodicea. A reconciliation was effected by the patriarch of Antioch, but tradition says that Eusebius finally resigned his charge and lived a studious life in Antioch. His fame as an astrologer commended him to the notice of the emperor Constantius II., with whom he became a great favourite, accompanying him on many of his expeditions. The theological sympathies of Eusebius were with the semi-Arian party, but his interest in the controversy was not strong. His life was written by his friend George of Laodicea. He was a man of extraordinary learning, great eloquence and considerable intellectual power, but of his numerous writings only a few fragments are now in existence.

See Migne, Patrologia Graec. vol. lxxxvi.

EUSEBIUS [OF MYNDUS], Greek philosopher, a distinguished Neoplatonist and pupil of Aedesius who lived in the time of Julian, and who is described by Eunapius as one of the "Golden Chain" of Neoplatonism. He ventured to criticize the magical and theurgic side of the doctrine, and exasperated the emperor, who preferred the mysticism of Maximus and Chrysanthus. He devoted himself principally to logic. Stobaeus in his Sermones collected a number of ethical dicta of one Eusebius, who may perhaps be identical with the Neoplatonist.

The fragments have been collected by Mullach in his Fragmenta Phil. Graec. and by Orelli, in Oeuvres vol. græc. sentent. et moral.

EUSEBIUS [OF NICOMEDIA] (d. 347), Greek bishop and theologian; the defender of Nicea. Eusebius of Nicomedia earnestly opposed, along with his namesake of Caesarea, the insertion of the Homounomian clause, but after being defeated in his object he also signed the creed in his own sense of οὐκ ὁμοιὸς καὶ ὁσίος. He refused, however, to sign the anathema directed against the Arians, but, as he afterwards explained, because of his variance from the Athanasian theology, but "because he doubted whether Arius really held what the anathema imputed to him" (Sozom. ii. 15). After the council he continued vigorously to espouse the Arian cause, and was so far carried away in his zeal against the Athenians that he was temporarily banished from his see for a disturber of the peace of the church. But his alienation from the court was of short duration. He obtained the confidence of the emperor's sister Constancia, through whose influence he was promoted to the see of Nicomedia, and by her favour he was restored to his position, and speedily acquired an equal ascendancy over the emperor. He was selected to administer baptism to him in his last illness. There seems no doubt that Eusebius of Nicomedia was more of a politician than a theologian. He was certainly a partisan in the great controversy of his time, and is even credited (although on insufficient evidence) with having used unworthy means to procure the deposition of Eustathius, the "orthodox" bishop of Antioch (Theodoret i. 21). His restless ambition and love of power are not to be denied. To the last he defended Arius, and at the time of the latter's sudden death, 336, it was chiefly through his menace, as representing the emporor, that the church of Constantinople was thrown into anxiety as to whether the leader should be readmitted to the bosom of the church. The death of Constantine followed hard upon that of Arius; and Eusebius, who was promoted in 339 to the see of Constantinople, became the leader of the anti-Arian party till his own death in (probably) 341. The real activity of Eusebius of Nicomedia must be studied in connexion with the Arian controversy (see ARIUS).

EUSKIRCHEN, a town of Germany, in the Prussian Rhine province, on a plateau lying to the E of the Eifel range, at the junction of railways from Cologne and Bonn and m. W. of the latter. Pop. (1905) 10,285. It has an Evangelical and a Roman Catholic church, and its industries include cloth, sugar and stocking manufactures, besides breweries and tanneries.

EUSTACE, the name of four counts of Boulogne.

EUSTACE I., a son of Count Baldwin II., held the county from 1046 until his death in 1049.

His son, EUSTACE II. (d. 1093), count of Boulogne, was the husband of Goda, daughter of the English king Æthelred the Unready, and aunt of Edward the Confessor. Eustace paid a visit to England in 1051, and was honourably received at the Confessor's court. A brawl in which he and his servants became involved with the citizens of Dover led to a serious quarrel between the king and Earl Godwine. The latter, to whose jurisdiction the men of Dover were subject, refused to punish them. His contumacy was made the excuse for the outlawry of himself and his followers. In 1066 Eustace came to England with Duke William, and fought at the battle of Hastings. In the following year, probably because he was dissatisfied with his share of the spoil, he assisted the Kentishmen in an attempt to seize Dover Castle. The conspiracy failed, and Eustace was sentenced to forfeit his English fiefs. Subsequently he was reconciled to the Conqueror, who restored a portion of the confiscated lands.

Eustace died in 1093, and was succeeded by his son, EUSTACE III., who went on crusade in 1096, and died about 1125. On his death the county of Boulogne came to his daughter, Matilda, and her husband Stephen, count of Blois, afterwards king of England, and in 1150 it was given to their son, Eustace IV.

EUSTACE IV. (d. 1153) became the heir-apparent to his father's possessions by the death of an elder brother before 1135. In 1137 he did homage for Normandy to Louis VII. of France, whose sister, Constance, he subsequently married. Eustace was knighted in 1147, at which date he was probably from sixteen to eighteen years of age; and in 1151 he joined Louis in an abortive raid upon Normandy, which had accepted the title of the emperor Matilda, and was not restored by Stephen of Anjou. At a council held in London on the 6th of April 1152 Stephen induced a small number of barons to do homage to Eustace as their future king; but the prime, Theobald, and the other bishops declined to perform the coronation ceremony on the ground that the Roman curia had declared against the claim of Eustace. The death of Eustace, which occurred during the next year, was hailed with general satisfaction as opening the possibility of a peaceful settlement between Stephen and his rival, the young Henry of Anjou. The Peterborough Chronicle, not content with voicing this sentiment, gives Eustace a bad
character. "He was an evil man and did more harm than good wherever he went; he spoiled the lands and laid thereon heavy taxes." He had used threats against the recalcitrant bishops, and in the war against the Angevin party had demanded contributions from religious houses; these facts perhaps suffice to account for the verdict of the thirteenth century.

EUSTATHIUS, of Antioch, sometimes styled "the Great" (fl. 325), was a native of Side in Pamphylia. About 320 he was bishop of Beroea, and he was patriarch of Antioch before the council of Nicaea in 325. In that assembly he distinguished himself by his zeal against the Arians, though the Allocution ad Imperatorem with which he has been credited is hardly genuine. His anti-Arian polemic against Eusebius of Caesarea made him unpopular among his fellow-bishops in the East, and he was condemned at Antioch in 330 passed a sentence of deposition, which was confirmed by the emperor. He was banished to Trayanopolis in Thrace, where he died, probably about 337, though possibly not till 360.

The only complete work by Eustathius now extant is the De Engrastrinnyho contra Originem (ed. by A. Jahn in Texte und Untersuchungen, ii. 4). Other fragments are enumerated by F. Loofs in Herzog-Hauck's Realencyklopädie.

EUSTATHIUS, or Euthathius, surnamed Macrembolites ("living near the long bazaar"), the last of the Greek romancers, flourished in the second half of the 12th century A.D. His title Protonobulismos shows him to have been a person of distinction, and if he is also correctly described in the MSS. as μεγας χαρακτηρικος (chief keeper of the ecclesiastical archives), he may have been a Christian. He was the author of The Story of Hypymne and Hypymnia, in eleven books, a tedious and inferior imitation of the Cleitophon and Leucippe of Achilles Tatius. There is nothing original in the plot, and the work is tasteless and often coarse. Although the author borrowed from Homer and other Attic poets, the chief source of his phrasology was the rhetorician Choricus of Gaza. The style is remarkable for the absence of hiatus and an extremely laboured use of antithesis. The digressions on works of art, apparently the result of personal observation, are the best part of the work. A collection of eleven Riddles, of which solutions were written by the grammarian Manuel Holobolos, is also attributed to Eustathius.

The best edition of both romance and riddles is by I. Hilberg (1876, which fixes the date of Eustathius between 850 and 900), with critical introduction and notes by Georges Sivry, and the solution of the Riddles alone by M. Treu (1893). On Eustathius generally, see J. C. Dunlop, History of Fiction (1888, new ed. in Bohn's Standard Library); E. Rohde, Der griechische Roman (1900); K. Krumbacher, Geschichte der byzantinischen Literatur (1897). There are many translations in modern languages, of which that by r. E. Bas (1825) may be recommended; there is an English version from the French by L. H. le Moine (London and Paris, 1788).

EUSTATHIUS, archbishop of Thessalonica, Byzantine scholar and author (probably a native of Constantinople), flourished during the second half of the 12th century. He was at first a monk, and afterwards deacon of St Sophia and teacher of rhetoric in his native city. In 1174 he was chosen bishop of Myra in Lycia, but in 1175 was transferred to Iznik by the holy emperor Manuel, and he hastened not to oppose the emperor, but to await an alteration in the formula of abjuration necessary for converts from Mahomedanism. In 1185, when Thessalonica was captured by the Normans under William II. of Sicily, Eustathius secured religious toleration for the conquerors. He died about 1193. His best known work is his Commentary on the Iliad and Odyssey of Homer (παρεκδοσια, critical compilations), valuable as containing extracts from the scholia of other critics, whose works have now perished. He also wrote a commentary on the geographical epic of Dionysius Periegetes, in which much of Stephanus of Byzantium and the lost writings of Arrian is preserved. A commentary on Findar has been lost, with the exception of the preface, which contains an essay on lyric poetry, a life of Pindar, and an account of the Olympic games. A history of the conquest of Thessalonica by the Normans, a congratulatory letter to his son, and a plea for an improved water-supply for Constantinople, and an extensive correspondence with clerical and lay dignitaries, are evidence of his versatility. He is also the author of various religious works, chiefly directed against the prevailing abuses of his time, which almost anticipate, though in a milder form, the denunciations of Luther; the most important of these is The Reform of Monastic Life. A commentary on the pentecostal hymn of John of Damascus may also be mentioned.

Editions: Homer Commentary, by G. Stallbaum (1829–1830); preface to Pindar Commentary, by F. W. Scheide, (1837); Dionysius Commentary in C. W. Müller, Geographici Graeci minores, ii.; pentecostal hymn, in A. Mai, Spicilegium Romanum, v. 2 (1841). The smaller works have been edited (1832) and the De Thessalonica (1839) by L. F. Tafel; many will be found in J. P. Migne, Patrologia Graeca, cxxv., cxxvii. Five new speeches have been edited by W. Regel, Eustathius, sive, Byzantinum, iii. (1892).

EUSTYLE (from Gr. εξελεφθη, well, and στηλος, column), the architectural term for the intercolumniation defined by Vitruvius (iii. 3) as being of the highest proportion, i.e. two and a half diameters (see INTERCOLUMNATION).

EUTAWVILLE, a town of Berkeley county, South Carolina, U.S.A., about 55 m. N.N.W. of Charleston. Pop. (1900) 305; (1910) 405. It is served by the Atlantic Coast Line railway. The town lies on high ground near the Santee river, in a region abounding in swamps, limestone cliffs and pine forests. At present its chief interest is in lumber, but in colonial days it was a settlement of aristocratic rice planters. The neighbouring Eutaw Springs issue first from the foot of a hill and form a large stream of clear, cool water, but this, only a few yards away, again rushes underground to reappear about 4 m. farther on. At Eutaw Springs, on the 8th of September 1781, was fought the last battle in the field in the Southern States during the War of American Independence. About 2,500 Americans under General Nathanael Greene here attacked a slightly inferior force under Colonel Alexander Stewart; at first the Americans drove the British before them, but later in the day the latter took a position in a brick house and behind palisades, and from this position the Americans were unable to drive them. On the night of the 9th, however, Colonel Stewart retreated toward Charleston, abandoning roo stand of arms. The battle has been classed as a tactical victory for the British and a strategical victory for the Americans, terminating a campaign which left General Greene in virtual possession of the Carolinas, the British thereafter confining themselves to Charleston. The Americans lost in killed and wounded 408 men (including Colonel William Washington, wounded and captured); the British, 693.

EUTHYDEMUS, a native of Magnesia, who overturned the dynasty of Diotodus of Bactria, and became king of Bactria about 230 B.C. (Polyb. xi. 34; Strabo xi. 515 wrongly makes him the first king). In 208 he was attacked by Antiochus the Great, whom he tried in vain to resist on the shores of the river Arius, the modern Herirud (Polyb. x. 49). The war lasted three years, and was on the whole fortunate for Antiochus. But he saw that he was not able to subdue Bactria and Sogdiana, and in 206 concluded a peace with Euthydemus, through the mediation of his son Demetrius, in which he recognized him as king of the Bactrians (Polyb. x. 34). In 191 he conquered the region of India. There exist many coins of Euthydemus; those on which he is called god are struck by the later king Agathocles. Other coins with the name Euthydemus, which show a youthful face, are presumably those of Euthydemus II., who cannot have ruled long and was probably a son of Demetrius.

(Ed. M.)

EUTIN, a town of Germany, capital of the principality of Lübeck, which is an enclave in the Prussian province of Schleswig-Holstein and belongs to the grand-duchy of Oldenburg, picturesquely situated on the Lake Eutin, 20 m. N. from Lübeck by the railway to Kiel. Pop. (1905) 5204. It possesses a Roman Catholic and two Protestant churches, a palace with a fine park, and a monument to Weber, the composer, who was

EUTROPIUS, Roman historian, flourished in the latter half
of the 4th century A.D. He held the office of secretary (magister
memoriae) at Constantinople, accompanied Julian on his expedition
against the Persians (363), and was alive during the reign of
Valens (364-378), to whom he dedicates his history. This work
(Breviarium historiae Romanae) is a complete compendium, in
ten books, of Roman history from the foundation of the city to the
accession of Valens. It was compiled with considerable care
from the best accessible authorities, and is written generally
with impartiality, and a delicate style of expression. The
Latin in some instances differs from that of the purest models,
the work was for a long time a favourite elementary school-book.
Its independent value is small, but it sometimes fills a gap left
by the more authoritative works. The Breviarium was enlarged
and continued down to the time of Justinian by Paulus Diaconus
(q.v.); the work of the latter was in turn enlarged by Landolfo
Sagax (c. 1000), and taken down to the time of the emperor
Leo the Armenian (813-820) in the Historia Miscell. Of the
Greek translations by Capito Licius and Paeanius, the
version of the latter is extant in an almost complete state. The
best edition of Eutropius is by H. Droysen (1879), containing the
Greek version of the first eleven books, and a Latin translation.
Small critical editions, C. Wagener (1884), F. Rühl (1887). J.
Sorn’s Der Sprachgebrauch des Historikers Eutropius (1892) contains
a systematic account of the grammar and style of the author. There
are numerous English school editions and translations.

EUTYCHES (c. 380-c. 450), a presbyter and archimandrite
at Constantinople, first came into notice in A.D. 431 at the
council of Ephesus, where, as a zealous adherent of Cyril (q.v.) of
Alexandria, he vehemently opposed the doctrine of the Nestorians
(q.v.). He was excommunicated by the council, and his exclusion
was not incarnated in but only attendant on Jesus, being superadded
to his human nature after the latter was completely formed.
In opposition to this Eutyches went so far as to affirm that
after the union of the two natures, the human and the divine, Christ
had only one nature, that of the incarnate Word, and that there-
fore His human body was essentially different from other human
bodies. In this he went beyond Cyril and the Alexandrine school
generally, who, although they expressed the unity of the two
natures in Christ so as almost to nullify their duality, yet took
care verbally to guard themselves against the accusation of
in any way circumscribing or modifying his real and true humanity.
It would seem, however, that Eutyches differed from the
Alexandrine school chiefly from inability to express his meaning
with proper safeguards, for equally with them he denied that
Christ’s human nature was either transmuted or absorbed into
his divine nature. The energy and impudence of Eutyches in
asserting his opinions led to his being accused of heresy by
Domnus of Antioch and Eusebius, bishop of Dorylaeus, at a
synod presided over by them in 430, and his explanations
were not considered satisfactory, the council
excommunicated him from his priestly office and excommunicated him;
but in 440, at a council held in Ephesus convened by Dioscorus
of Alexandria and overawed by the presence of a large number
of Egyptian monks, not only was Eutyches reinstated in his
office, but Eusebius, Domnus and Flavian, his chief opponents,
were deposed, and the Alexandrine doctrine of the “one nature”
received the sanction of the church. This judgment is the more
interesting as being in distinct conflict with the opinion of the
bishop of Rome—Leo—who, departing from the policy of his
predecessor Celestine, had written very strongly to Flavian in
opposition to the doctrine of the two natures and one person.
Meanwhile the emperor Theodosius died, and Pulcheria and
Marcian who succeeded summoned on October 454, a council
(the fourth ecumenical) which met at Chalcedon (q.v.). There
the synod of Ephesus was declared to have been a “robber synod,”
its proceedings were annulled, and, in accordance with the rule
of Leo as opposed to the doctrines of Eutyches, it was declared
that the two natures were united in Christ, but without any
alteration, absorption or confusion. Eutyches died in exile, but
of his later life nothing is known. After his death his doctrines
obtained the support of the Empress Eudocia and made
considerable progress in Syria. In the 6th century they received a
new impulse from a monk of the name of Jacob, who united
the various divisions into which the Eutychians, or Mono-
physites (q.v.), had separated into one church, which exists at
the present time under the name of the Jacobite Church, and
which has numerous adherents in Armenia, Egypt and Ethiopia.

Harnack, History of Dogma, iv. passim; F. Loofs, Dogmengeschichte
(4th ed., 1906), 397 ff., and the art. in Herzog-Hauck, Realencyk.
faer prot. Theol., with a full bibliography.

EUYUK, pope from 275 to 283. His original epithet
was discovered in the catacombs (see Kraus, Roma sotterranea,
p. 154 et seq.), but nothing more is known of him.

EUYUCHIDES, of Sicyon in Achaia, Greek sculptor
of the latter part of the 4th century B.C., was a pupil of Lysippus.
His most noted work was a statue of Fortune, which he made
for the city of Antioch, then newly founded. The goddess, who
embodied the idea of the city, was seated on a rock, crowned with
towers, and having the river Orontes at her feet. There is a small
copy of the statue in the Vatican (see GREEK ART). It
was imitated by a number of Asiatic cities; and indeed most statues
of cities since erected borrow something from the work of
Euyuchides.

EUYUK, or EÜUK (the eu pronounced as in French), a small
village in Asia Minor, in the Angora vilayet, 12 m. N.N.E.
of Boghaz Keui (Plerio), built on a mound which contains some
remarkable ruins of a large building—a palace or sanctuary—
the Greek period and belonging to the same civilization
as the ruins and rock-reliefs at Plerio. These ruins consist of
a gateway and an approach enclosed by two lateral walls, 15 ft.
In one of these walls, there is the return at right angles, one to right
and one to left. The gateway is flanked by two huge blocks, each carved
in front into the shape of a sphinx, while on the inner face is a relief of a two-headed eagle
with wings displayed. Of the approach and its returning walls
only the lower courses remain: they consist of large blocks
adorned with a series of bas-reliefs similar in type to those
on the rocks of Boghaz Keui. Behind the gateway is
another vestibule leading to another portal which gives entrance
to the building, the lateral walls and abutments of the portal
being also decorated with reliefs much worn. These reliefs
belong to that pre-Greek oriental art generally called Hittite,
of which there are numerous remains in the eastern half of
the peninsula. It is now generally agreed that the scenes are
religious processions. On the left returning wall is a train of
priestly attendants headed by the chief priest and priestess
(the latter carrying a lltisus), clad in the dress of the deities
they serve and facing an altar, behind which is an image of a bull
on a pedestal (representing the god); then comes an attendant
bearing a bull and three rams for sacrifice, followed by more
attendants, each lttisus or musical instrument, after whom comes
a bull bearing on his back the sacred cista (?) On the lateral walls
of the approach we have a similar procession of attendants
headed by the chief priestess and priest, who pours a libation at the feet
of the goddess seated on her throne; while on the right returning
wall are fragments of a third procession approaching another
draped figure of the goddess on her throne (placed at the angle
opposite the bull on the pedestal), the train being again brought
up by a bull.

These are all scenes in the ritual of the indigenous naturalistic
religion which was spread, in slightly varying forms, all over Asia Minor, and consisted in the worship of the self-reproductive powers of nature, personified in the great mother-goddess (called by various names Cybele, Leto, Artemis, &c.) and the god her husband-and-son (Attis, Men, Sabazios, &c.), representing the two elements of the ultimate divine nature (see Great Mother of the Gods). Here, as in the oriental mysteries generally, the goddess is made more prominent. Where Greek influence affects the native religion, emphasis tends to be laid on the god, but the character of the religion remains everywhere ultimately the same (see Ramsay, Cities and Bishops of Phrygia, ch. iii.).

EVAGORAS, son of Nicoses, king of Salamin in Cyprus 410-374 B.C. He claimed descent from Teucer, half-brother of Ajax, son of Telamon, and his family had long been rulers of Salamis until supplanted by a Phoenician exile. When the usurper was in turn driven out by a Cyprian noble, Evagoras, fearing that his escape would lead to Calcidia, returned secretly in 410, and with the aid of a small band of adherents regained possession of the throne. According to Isocrates, whose panegyric must however be read with caution, Evagoras was a model ruler, whose aim was to promote the welfare of his state and of his subjects by the cultivation of Greek refinement and civilization, which had been almost obliterated in Salamis by a long period of barbarian rule. He cultivated the friendship of the Athenians, and after the defeat of Conon at Aegospotami he afforded them refuge and hospitality. For a time he also maintained friendly relations with Persia, and secured the aid of Artaxerxes II. for Athens against Sparta. He took part in the battle of Cnidus (394), in which the Spartan fleet was defeated, and for this service his statue was placed by the Athenians side by side with that of Conon in the Ceramicus. But the energy and enterprise of Evagoras soon roused the jealousy of the Great King, and relations between them became strained. From 391 they were virtually at war. Aided by the Athenians and the Egyptian Hakor (Acoris), Evagoras extended his rule over the greater part of Cyprus, crossed over to Asia Minor, took several cities, but was forced to withdraw when he and the scholars he had gathered fled secretly to Cilicia. After the peace of Antalcidas (387), to which he refused to agree, the Athenians withdrew their support, since by its terms they recognized the lordship of Persia over Cyprus. For ten years Evagoras carried on hostilities single-handed, except for occasional aid from Egypt. At last he was totally defeated at Citium, and compelled to flee to Salamis. Here, although closely blockaded, he managed to hold his ground, and took advantage of a quarrel between the Persian generals to conclude peace (376). Evagoras was allowed to remain nominally king of Salamis, but in reality a vassal of Persia, to which he was to pay a yearly tribute. The chronology of the last part of his reign is uncertain. In 374 he was assassinated by a eunuch from motives of private revenge.

The chief authority for the life of Evagoras is the panegyric of Isocrates addressed to his son Nicoses; see also Diod. Sic. xiv. 115, xv. 2-9; Xenophon, Heliconia, iv. 8; W. Judeich, Kleinasiatische Studien (Marburg, 1892), and art. HELICONIA.

EVAGRIUS (c. 356-600), surnamed Scholasticus, Church historian, was born at Epiphania in Coele-Syria. His surname shows him to have been an advocate, and it is supposed that he practised at Antioch. He was the legal adviser of Gregory, patriarch of that city, whom he successfully defended at Constantinople against certain serious charges. Through this connexion he was brought under the notice of the emperor Tiberius Constantine, who honoured him with the rank of quaestor; Maurice Tiberius made him master of the rolls. His influence and reputation were so considerable that on the occasion of his second marriage a public festival was celebrated in his honour, which was interrupted by a terrible earthquake. Evagrius's name has been preserved by his Ecclesiastical History in six books, extending over the period from the third general council (that of Ephesus, 431) to the year 593. It thus continues the work of Eusebius, Socrates, Sozomen and Theodoret. Though not wholly trustworthy, and often very credulous, this work is on the whole impartial, and appears to have been compiled from original documents, from which many valuable excerpts are given. It is particularly helpful to the student of the history of dogma during the 5th and 6th centuries, while the political history of the time is by no means neglected. Evagrius made use of the writings of Eustathius, John of Ephipania, John Malalas, Procopius, and (possibly) Manentor Protector.

The best edition of the History is that of L. Parmentier and J. Bidez (London, 1898), which contains the Scholia; it is also included in Migne's Patrologia Graeca, ixxxvi. There is an English translation in Bohn's Quellen und Untersuchungen zu den griechischen Kirchenhistorikern (1884).

EVANDE (Gr. Ευάνθε, "good man"), in Roman legend, son of Mercury and Carmenta, or of Echmeus, king of Arcadia. According to the story, Evander left the Arcadian town of Pallantium about sixty years before the Trojan War and founded Pallanteum or Palantium on the hill afterwards called the Palatine. This is one of the many Greek legends adopted by the Romans for the purpose of connecting places in Italy with others of like-sounding name in Greece. To Evander was attributed the introduction of Greek rites and customs into his new country; of writing, music and other arts; of the worship of Pan (called Faunus by the Italians) and the festival of Lupercalia. In Virgil he receives Aeneas hospitably, and assists him against Turnus. Probably Evander was identical with the god Faunus (the "favoures"); and the tale of his Arcadian origin was due to the desire to establish connexion with Greece; the name of his reputed mother (or wife) Carmenta is genuinely Italian.

See Lit. v. 6; 7; Ovid, Fasti, i. 471, v. 99; Dion. Halic. i. 31-33; Virgil, Aeneid, viii. 335.

EVANGELICAL ALLIANCE, an association of individual Christians of different denominations formed in London in August 1846, at a conference of over 900 clergymen and laymen from all parts of the world, and representing upwards of fifty sections of the Protestant church. The idea originated in Scotland in the preceding year, and was intended "to associate and concentrate the strength of an enlightened Protestantism against the encroachments of popery and Puseyism, and to promote the interests of a scriptural Christianity," as well as to combat religious indifference. A preliminary meeting was held at Liverpool in October 1845. The movement gained wide support in other countries, more especially in America, and organizations in connexion with it now exist in the different capitals throughout the world. The object of the alliance, according to a resolution of the first conference, is "to enable Christians to realize in themselves and to exhibit to others that a living and everlasting union binds all true believers together in the fellowship of the church." At the same conference the following nine points were adopted as the basis of the alliance: "Evangelical views in regard to the divine inspiration, authority and sufficiency of the Holy Scriptures; the right and duty of private judgment in the interpretation of the Holy Scriptures; the unity of the Godhead and the Trinity of persons therein; the utter depravity of human nature in consequence of the fall; the incarnation of the Son of God, His work of atonement for sinners of mankind, and His mediatorial intercession and reign; the justification of the sinner by faith alone; the work of the Holy Spirit in the conversion and sanctification of the sinner; the immortality of the soul, the resurrection of the body, the judgment of the world by our Lord Jesus Christ, with the eternal blessedness of the righteous and the eternal punishment of the wicked; the divine institution of the Christian ministry, and the obligations and perpetuity of the ordinances of Baptism and the Lord's Supper," it being understood, however, (1) that such a summary "is not to be regarded in any formal or ecclesiastical sense as a creed or confession," and (2) that "the selection of certain tenets, with the omission of others, is not to
be held as implying that the former constitute the whole body of important truth, or that the latter are unimportant.”

Annual conferences of branches of the alliance are held in England, America and several continental countries; and it is provided that a general conference, including representatives of the whole alliance, be held every seventh year, or oftener if it be deemed necessary. Such conferences have been held in London in 1851; Paris, 1855; Berlin, 1857; Geneva, 1861; Amsterdam, 1867; New York, 1873; Basel, 1879; Copenhagen, 1885; Florence, 1891; London, 1896 and 1907. They are occupied with the discussion of the “best methods of countering infidelity, Romanism and ritualism, and the desecration of the Lord’s Day,” and of furthering the positive objects of the alliance. The latter are sometimes stated as follows: (a) “The world girdled by prayer”; a world-wide week of prayer is held annually, beginning on the first Sunday in the year. (b) “The maintenance of religious liberty throughout the world.” (c) “The relief of persecuted Christians in all parts”; the alliance has agents in many countries to help the persecuted by distributing relief, &c., and in Russia there is a travelling agent who endeavour to help the Stundists. (d) “The manifestation of the unity of all believers and the upholding of the evangelical faith.”

The following publications may be mentioned:—The Evangelical Alliance Monthly Intelligencer, The Evangelical Alliance Quarterly, both published in London; A. J. Arnold, History of the Evangelical Alliance (London, 1897); and the reports of the proceedings of the different conferences.

**EVANGELICAL ASSOCIATION** of North America, a religious denomination, founded about the beginning of the 19th century by Jacob Albright (1759-1808), a German Lutheran of Pennsylvania. About 1790 he began an itinerant mission among his fellow-countrymen, chiefly in Pennsylvania; and meeting with considerable success, he was, at an assembly composed of adherents from the different places he had visited, elected in 1800 presiding elder or chief pastor, and shortly afterwards rules of government were adopted somewhat similar to those of the Methodist Episcopal Church. The theological standards of the two bodies are also in close agreement. In 1807 Albright was appointed bishop of the community, which adopted its present name in 1818. In 1816 the first annual conference was held, and in 1843 there was instituted a general conference, composed of delegates chosen by the annual conferences and constituting the highest legislative and judicial authority in the church. The members of the general conference hold office for four years. In 1891 a long internal controversy resulted in a division. A law-suit awarded the property to the branch making its headquarters at Indianapolis, whereon the other party, numbering 40,000, that met at Philadelphia, constituted themselves the United Evangelical Church. The Association in 1906 had about 105,000 members, besides some 10,000 in Germany and Switzerland, and has nearly 2000 churches and 1200 itinerant and other preachers. There are four bishops. It distributes much evangelical literature, and supports a mission in Japan.
